We have already stated that several of these fishes have in recent times been made the subjects of careful scientific investigation, and we shall proceed, in a succeeding paper, to take a closer view of their habits, and more especially of that wonderful property with which they are in common endowed.

"THE LONDON AND BIRMINGHAM RAILWAY."

A VOLUME of very elegant appearance, both as respects typography and pictorial embellishments, with the above title, and of which the letterpress is composed by Thomas Roscoe, Esq. has just made its appearance.* The railway from London to Birmingham is now the greatest public work in Britain, and promises to be the most successful, as well as the most generally useful. Such a magnificent work of art fully deserves a volume such as that before us, and such a historian as Mr Roscoe, who possesses not only a fine perception of the beauties of nature, but of what is excellent and available in art. Resembling the more elegant of the *Annals*, his book is worth a thousand of these flimsy productions. Referring to the work itself for an account of the line of railway, and the country through which it passes, we can spare room for only the following sketch of Birmingham, which is daily growing in importance as a centre of an extensive series of thoroughfares:—

"Birmingham is properly esteemed, if the extent and variety of its products be considered, one of the most important manufacturing towns in the British empire. In the early accounts of this place, the etymology of its name has been followed through no less than a hundred and forty variations, ranging from Bromwicham to Bermyngeham, which, from their complicity and number, have puzzled the mind and stimulated the invention of many a learned antiquary, who has sought in the productions of the soil, or in some local or neighbouring circumstances, for a satisfactory explanation. The probable fact is, however, that it took its title from the lord of the manor, one Peter de Birmingham, who, in the year 1154, as the historian of the county writes, 'had a castle here, and lived in great splendour.'

Birmingham is advantageously situated on the side of a hill, or rather a series of hills. It is nearly in the centre of the kingdom, and, during the Saxon heptarchy, was included in that portion of it which was under the sway of the Mercian kings. It is now, however, in the county of Warwick, and the hundred of Hemlingford, and is bordered by the neighbouring counties of Stafford and Worcester. It is 110 miles north-west from London, by way of Coventry, 116 by Oxford, and 112½ by the railway. The superficial contents of the parish are 2864 acres, and its inhabitants are about 160,000. It became a borough on the passing of the Reform Bill, and has now attained to the importance of a corporation town under the new municipal act.

The atmosphere of this place, from the comparatively high position which it occupies, is not less congenial and kind than the dry sandy soil on which it is built. It does not, as it is justly remarked by a modern author, 'crouch in humility of site, but boldly solicits the ingress of the winds from each point of the compass; and as few of the streets lie on a dead flat, every shower conduces to cleanliness and health: this, with the admission of free access to currents of air, and the sun's genial rays, prevents agues, and all the train of epidemics, from being known.' There could not, perhaps, be adduced a stronger evidence of the truth of this remark, than the fact, that while the cholera, which passed through the kingdom like a destroying angel a few years since, was raging with the most destructive violence in the little town of Bilston, distant from Birmingham only about eight miles, and throughout the surrounding district of Staffordshire, scarcely a single fatal case of this disease occurred in this place. Many persons entertain the idea that our good town of Birmingham is literally enveloped in a cloud of dingy atmosphere, arising from steam-engines, and the various metallic manufactures in constant operation. A

* Transactions of the American Society, vol. II.

* Tilt, London.

distant view of the place, with the towering chimneys of its furnaces vomiting forth columns of smoke, might indeed seem to give confirmation to such an idea; but it becomes speedily dissipated as the visitor enters the clean and spacious streets of this town, and observes that the chimneys, from their extreme height, give their smoke to the winds, which carry it far away from the place where it is generated. It is well known, also, that the fuel which is used in its manufactures is much lighter than the Newcastle coal, and, consequently, deposits less of those black particles which thicken the air and disfigure the buildings of the metropolis. * *

The Restoration seems to have been the first era that gave an onward impulse to the ingenuity of the inhabitants of this town. The love of ornament and show was imported with the licentious Charles II., and the gay companions of his exile, from the luxurious court of Louis XIV., where they had been long resident. The flowery and flowing style superseded the stiff and Gothic, which characterised the furniture, domestic decorations, and personal embellishments of our ancestors. The sleight-of-hand attained by the artificers of Birmingham, fitly prepared them to take advantage of this change of fashions, and this town being the mart of the brilliant and ductile metals, soon became, what it was afterwards styled by Burke, 'the toy-shop of Europe.' The wars which spread over Europe from the time of Louis XIV. to the French Revolution, introduced a new era into the manufactures of Birmingham, and, in addition to the *bijouterie* of fashion, came the production of fire-arms, to supply both friends and enemies with warlike implements, from the richly ornamented pistol to the most ponderous piece of artillery, with all the manifold weapons of war. Peace has, however, literally 'beaten the swords into ploughshares, and spears into pruning-hooks.' The dexterous artificers of the town were ready to profit by the change, and the fabrication of every species of agricultural instrument and working tool used in the peaceful handicraft arts, with the multifarious articles of personal attire, has followed. Successive demands, either of necessity or luxury, have called forth new and applicable powers to meet them, and the hammer, the lathe, the rolling apparatus, the press, the stamp, the die, the draw-bench, and the steam-engine, have each supplied their mechanical and multiplying agencies in the order of wants thus created. We know not that a time will ever arrive in which it shall be said to the inventive faculty of man, 'thus far shalt thou go, and no farther.' A long period of national and local tranquillity has given space for the creation of new wants, and the development of new energies. In this interval one discovery has followed fast upon another, the sciences have yielded to the patient perseverance and the penetrating genius of the human intellect, and new combinations of primitive elements have become the basis of new mechanical and handicraft inventions. The vastly accelerated energies of the mind have seemed to call for corresponding vivacity of physical locomotion, and man, whose imagination can stretch from place to place in the lapse of a moment, seems destined to attain to a celerity of corporeal transition almost coequal. The perfection of the steam-engine, and the application of this principle to locomotion, is another remarkable era in the history of this place, fraught with invaluable results. The improvement and completion, if not the discovery, of this wonderful engine, is indigenous to Birmingham, while the real science, ingenious contrivance, and manual dexterity concentrated in this place, with 'all the natural appliances to boot,' seem to bespeak for it the very extensive manufacture of this gigantic machine. Thus the whole circle of the mechanical arts, from a gold ring to an iron railroad, from a button to a brazen Colossus, from a teakettle to a steam-engine, appears destined to run its course in this highly favoured town, and its immediate neighbourhood, 'for ever and for aye.'

The visitor, on entering Birmingham, is most anxious to see its peculiar products, and the manufacturing process by which they are obtained. We will, therefore, in the first place, conduct him to the Show-Rooms of Mr Collis, who has succeeded to those formed with so much taste and splendour by Sir Edward Thomason. The great lions of this establishment are the faithful copies of the celebrated Warwick vase, and the colossal statue of George IV. in bronze. The original Warwick vase, which now stands in the conservatory of Warwick Castle, is the Grecian vase of Lysippus, a sculptor of the age of Alexander the Great. It was excavated from the ruins of Adrian's palace at Tivoli, and brought to England by Sir William Hamilton. The copy is metallic bronzed, and took the labour of seven years to complete. It has acquired by time, and the process adopted in its formation, a soft solidity of colour and a gradation of bronze tints, which give peculiar beauty to its rich and varied ornaments. The statue is of the same material, and was modelled, cast, and sculptured, in the manufactory. The suite of rooms is extensive, and the objects of curiosity and sale are classified. Amongst these is comprised the finest and most extensive collection of medals to be seen in the kingdom; miniature copies of the Warwick vase in silver, and in crystal, mounted on silver pedestals; a vast assemblage of plate and plated articles; and every minute variety of the ornamental and useful manufactures of the town.

A range of workshops and manufactories, where the most costly articles of the Show-Rooms have been fabricated, lie at the back part of the premises, and are open to the inspection of visitors.

The Show-Rooms of Messrs Jemmens and Bettridge,

in Constitution Hill, offer a very attractive exhibition of the manufactures of Birmingham in *papier maché*. Perhaps there is no art, of an ornamental character, that has been transplanted into England from the country of its original invention, that has attained to so high a degree of perfection, and has been made susceptible of such multiform varieties, as that which is included under this title. The respectable establishment to which we have now introduced the visitor, ranks as the first in this town, or perhaps in Europe, for its tasteful devices, the ingenious adaptation of beautiful materials, and the grace and finish of its execution. The sale-room displays some singularly beautiful specimens, inlaid with rainbow-tinted pearls, harmonising their cameo hues with all the subjects of natural history, and thrown into all the forms and figures of ornament and use. The exhibition also comprehends that almost endless variety of indispensable articles which enter into the purposes of every-day life. A free admission is given to the visitors into the workshops, and the process of the manufactures very courteously and minutely described, if required.

Glass-making is an art practised with so much dexterity by the workman, and the various articles to which it applies are multiplied with so much expedition, that it might be thought the productions of one year, in this glass-blowing town, would leave a holiday for several succeeding years. Happily, however, for the artisan in this branch of human device, the brilliant utensil is as easily broken as the air bubbles of a child, which it not inaptly resembles in its first appearance at the end of the artificer's tube, before it is fashioned by the breath of his mouth into the form which it is finally intended to assume. The process of glass-cutting, nevertheless, is not of so aerial a character. It requires a practised eye and a dexterous hand, and is, besides, a work of continued labour and persevering industry. Both these departments of the manufacturing art are carried on to a great extent in this place, and a splendid variety of their united productions is to be found in an extensive suite of show-rooms belonging to Messrs Rollason and Sons, in Steelhouse-lane. In this exhibition there is also an assemblage of the most brilliant and useful productions of the Staffordshire potteries in all their variety of decoration, form, and application. The proprietors are very polite in showing to visitors the process of glass making and cutting, as carried on in the manufactories with which they are connected.

Besides those exhibitions which have been enumerated, Birmingham contains many splendid shops devoted to the display of its peculiar productions—of which the most eminent are in High Street, Bull Street, and New Street. Many of the manufactories, not connected with any retail establishments, may be visited by strangers, upon application, or by an introduction from some respectable inhabitant of the town.

The stranger, after having travelled over workshops and manufactories, will be glad to find himself once more in the open street; and as 'restlessness is the peculiar character of the present generation,' he need not tarry long before he discovers another object ready to engage his attention, and we predict, to fix for some time his admiration. The Town Hall is the most magnificent structure in Birmingham, and from its pure classic design, elaborate architectural ornaments, extent and capacity, is an object of well-merited curiosity and interest to every visitor. It is a simple Corinthian temple, from the example of the temple of Jupiter Stator at Rome, and is the design of Messrs Hansom and Welch. It is built of brick, cased with Anglesey marble, from the Penmon quarries, which was presented by Sir Richard Bulkley, Bart., to the architects, and from them to the town. Its quality is considered almost imperishable, and the colour is a fine neutral grey which whitens with time.

It is colossal in its proportions, and rears itself with peculiar majesty from nearly the highest point in Birmingham. On each side and in front is a projecting rusticated basement of prodigious strength, twenty-three feet in height, which encloses a spacious corridor, and convenient entrances to the great hall. Surmounting the basement is a gradual flight of regular ascending lines of shallow steps, and on these rise, with surpassing grace and dignity, elevated ranges of richly-fluted Corinthian columns that encompass the building. The spacious room which this splendid edifice contains, is perhaps the largest in Europe, or in the world, having a clear length of 145 feet, with 65 feet in width and height. It will contain from eight to ten thousand persons, standing within its ample area, and possesses two side galleries tastefully decorated, which are entered by doors from the corridor behind, with an end gallery of great depth and elevation. It is lighted by twenty-seven lofty windows, separated by ornamental pilasters of the same order as the building; by the side of which are massy antique candelabra, harmonising with the colour of the interior, and taking their tone from the walls and the rich impanelled ceiling. A grand staircase in front leads to the galleries, which flies off to the right and left to correspond with the upper corridors. The projected cost of this magnificent structure was L.24,000, raised by a rate upon the inhabitants of the town; besides which, L.6000 was paid by the friends of Mr Welch, one of the architects, who became bound for the accomplishment of the contract, which was found inadequate to the undertaking. The total amount therefore was L.30,000.

The entire end of the hall is filled by an orchestra and the splendid organ, placed here by the governors of the hospital for the use of the triennial musical

festivals, instituted for the purpose of aiding the funds of that charity. This magnificent organ, in its dimensions, exceeds the celebrated instruments of Haarlem and Rotterdam; and in the depth, power, variety, and sweetness of its tones, far surpasses any in Europe. It was built by Mr Hill of London, at the expense of L.6000, raised principally by subscription."

WALKS IN THE BRITISH MUSEUM.

ROOM OF EGYPTIAN ANTIQUITIES.—SECOND ARTICLE.

At the conclusion of the preceding article, we were speaking of the specimens of household furniture of the Egyptians to be seen in the British Museum. Besides those remarkably interesting articles, there are found in the collection a variety of specimens of utensils for domestic use, such as vases, jugs, and similar vessels of different shapes and sizes. These are mostly of earthenware, glazed or plain, and the majority of them resemble in shape the brown jars or pitchers which are extensively used in the rural districts of our own country in the present day, having narrow necks, with or without handles, and rounded bodies terminating in a flat broad base. These jugs are of all sizes, from the height of an inch or two to a foot and a half, or two feet. Most of them are more or less covered with figures and hieroglyphics. The same may be said of the numerous other vases which we find here, which are not of earthenware, but of marble, alabaster, porphyry, green basalt, glass, or metal. These are generally of smaller bulk, and of the most varied and fanciful shapes, some of them having long necks, and others short; some presenting round bodies, others flat; while some rest on broad bases, and others on narrow or on rounded ones—in which latter case they are intended for being placed on stands. Till the present day, in Italy, the brown earthen pitchers of the peasantry are formed with pointed bases, and are placed in stands for their support. Specimens of glass bottles are likewise seen with long necks, and altogether resembling a kind of case-bottle now very common in Britain. The colour of the glass is usually an opaque green. We do not discover any instance in which colourless transparent glass has been used in the manufacture of these articles. The nearest approach to it occurs in the case of some small bottles made of porphyry, which, though streaked beautifully with yellow, black, blue, and green, are on the whole lighter in hue, and more transparent, than any similar articles to be seen on these shelves. Porcelain was another substance, with the manufacture of which the Egyptians were well acquainted. Numbers of jugs and vases, made of this material, present themselves to the spectator in the shelves of the Museum. Looking at these articles collectively, every one must be impressed with the conviction, that, as regarded glasses and such like vessels for domestic use, the people of ancient Egypt were far from being ill provided either in point of comfort or elegance.

A very perfect specimen of the *stands* or supports upon which vases or rounded bottles were placed in the Egyptian houses, is to be seen in one of the Museum cases. This stand is about two feet in height, of a pyramidal shape, but with the top flattened, and a cup placed thereon for the reception of the vase. The four legs of this stand are joined by crossing spars, and the whole is formed of wood, gaudily painted. Such articles were probably intended for standing at the elbows of guests during entertainments, or for holding ointments and perfumes in dressing-rooms, and must have formed an elegant addition to the other furniture, if we may judge from this specimen.

In one case of the Egyptian room (that marked with the letter T), we find some very dusky-looking crumbs, which, but for some explanation on the part of those better acquainted with the matter, might be passed over as relics of no very important kind. These, however, are really interesting articles, being specimens of the bread in use among the Egyptians. The colour of these remnants is a dark brown, and they resemble grains of coarse sand. From the stones found in them, it is obvious that some of these morsels of bread have been formed from the fruit of the date-tree, while other fragments appear to be composed of barley and wheat. One or two small cakes still retain their perfect original shape, that of a flat shrunken pancake, into which they were put by some Egyptian housewife three thousand years ago. They constituted part of a small but complete feast discovered in a tomb at Thebes, and beside them lie several other articles of food that were found along with them. Among these, a dish of raisins is particularly noticeable, being scarcely distinguishable in appearance from the same articles as found in shops at the present day. But the most remarkable portions of this same feast are two ducks, now in the condition of shrivelled skeletons, lying upon a stand or platter, made of cane and papyrus. Whether this feast, however, was ever intended for human use, or was merely placed in the tomb in accordance with the ceremonial usages of the country, may be a reasonable matter of doubt. The latter supposition is certainly the probable one. But this circumstance does not affect the feelings which these venerable ducks are calculated to excite in our

minds. The sight of them carries us forcibly back into the domestic presence of the human beings who so far preceded us on the stage of time. How little could the dresser of these fowls have foretold or foreseen that they were destined to become objects of curiosity to the world, after the lapse of so many ages!

In the same case with these edible remains, we find a yoke and strap, of a kind extensively used by the Egyptians in carrying burdens. Generally speaking, this resembles the yoke employed by milk-carriers at the present day, to suspend their pails from. The wooden bar formed to cross from shoulder to shoulder, is somewhat more than three feet long, and in shape like an unstrung bow, the middle being slightly bent, and the ends curved the reverse way. From each of these ends a strap depends, formed of a strong double thong of leather, fifteen inches or so in length. There are loops at the end of these straps, for the purpose, seemingly, of attaching loads. This yoke served almost all the purposes of Egyptian labour, where things were to be conveyed to a distance, as is shown by the figures on the painted tombs. Placed beside this yoke in the Museum, we observe a strong ladder of rope, an article which, with proper fastening, might obviously be as securely used for general purposes, as the common wooden ladders employed at the present day.

In the cases adjoining the preceding one, an immense number of small yet curious articles present themselves, consisting of edge-tools of various kinds, carpenters' instruments, warlike weapons, and the like. There are several specimens of common knives, with fixed blade and handle. These are of various sizes, and do not exhibit much skill in the workmanship, though the disfigurements of time must be partly taken into account. We looked in vain for any instance of a knife with closing blade. The only specimen of a shutting knife was a curiously contrived one, resembling a pair of scissors, in so far as the cutting was effected by two meeting edges, but having the point of support at the *extremity*, instead of being in the centre. A pair of nut-crackers gives an idea of the principle on which the knife was made. It seemed a very awkward weapon, and could only divide small bodies introduced between the blades. In regard to handy, useful knives, therefore, modern times appear to have really a decided advantage. Not so in the case of sickles or reaping-hooks. Making allowance for a little rust, a sickle to be seen here might have been taken, as respects shape and size, for one newly from the shop of a modern ironmonger. Numberless have been the attempts to improve the form of reaping instruments in recent years, but three hundred years ago, the grain of the earth was cut just as it is now. Strange to say, we find here also almost all the carpenter tools now in use. Fortunately, a recent visitor to Egypt, Mr. Burton, discovered in one of the tombs of Thebes a basket with a complete assortment of carpenters' instruments; and these, being lodged in the Museum, are now open to the inspection of the curious. Among them, we find a *saw*, *chisels*, a *mallet*, *drill* and *drill-bow*, with a small *horn of oil*, and a bag, seemingly for *nails*; the whole representing the stock in trade, or part of the stock, of some defunct carpenter, with whose remains they had been committed to earth. The saw is a small one, fitted for use with one hand, and fashioned something like a carving-knife. Perhaps most people will consider the drill as the most interesting of these articles, from its exhibiting the instrumental skill to which the carpenters of ancient Egypt had attained. The oil-horn differs in no point from those in general use at this day. In the same cases are a number of Egyptian nails of different sizes. These are headed precisely like modern ones, but we observe no *screw-nails* in the collection, and, in truth, this variety of the article seems to have been unknown to the Egyptians—though rust would render the matter difficult, occasionally, to determine.

Saws, chisels, mallets, drills and bows, bags of nails, and oil-horns, appear, then, from the models here presented, to have been the common instruments of the carpenters of long past ages. And are they not the ordinary and chief tools of the trade yet? Certainly the people of Egypt must either have been a peculiarly clever race, or man's invention is at best a bounded and barren thing. The same reflection is forced upon us when we look at other edge-tools in these cases. Here is a dagger, which, in its palmy days, must have been as handsome an article as any Highland chief could wish to see at his girdle at a meeting of the clans on Braemar. It is of the size of a small dirk, and has a handsome handle of ivory, once ornamented, it is probable, with precious stones. We have also before us on these shelves a beautiful specimen of a battle-axe. The blade is of bronze, in the shape of a segment of a circle, and is affixed to a strong *silver* tube, into which the handle, of ivory probably, was once inserted. These have been elegant weapons, quite equal, in their way, to any thing of the kind in the hands of modern warriors. It is true that the invention of gunpowder has made a great change in one respect. In place of pistol locks and Joe Manton barrels, the Egyptian armoury in the British Museum presents to us but a poor equivalent in the form of arrow-heads and long-feathered reeds. The Egyptian arrows, however, were far from being rude or ineffective weapons. Several neat specimens have been preserved of the metal barbs with which they were usually tipped; and from some of the paintings in the Theban tombs, we learn that, as regarded the shape and manufacture of the bows, the elegance of the painted leather cases in which they were kept, and other points about the archer's equip-

ment, the moderns who practise this exercise would suffer by a comparison with the Egyptians.

Some sadly mutilated fragments of stringed instruments arrest the attention of the visitor to the room of Egyptian antiquities. A fragment of a large harp is here seen, with the pegs, to the number of seventeen, remaining in the position in which the strings were attached to them. There are other relics of a similar kind, but all of them, unfortunately, are very incomplete, and deficient in the strings, which were formed by the Egyptians from catgut. This loss is not altogether the necessary result of time acting on a perishable substance, for instruments have been found in the Egyptian tombs, which possessed strings that sounded on being struck, after a silence of three thousand years. The true Egyptian harp appears to have been of an erect curved shape, like the modern harp, and to have rested on a base of more or less breadth. Besides these fragments of stringed instruments, the British Museum contains some smaller musical articles, and among others a pair of cymbals, of five inches diameter, and formed of sounding brass. It is to be regretted that more relics of a musical nature have not come down to us, as there is every reason to suppose, from the evidence of the sepulchral paintings, that the Egyptians were partial to the science, and possessed numerous instruments, both stringed and otherwise. They were well acquainted with the drum, and indeed a very perfect specimen of this instrument was found recently by a foreigner at Thebes. How interesting would have been a discovery of portions of their music—if, indeed, they possessed the art of notation in any form. Of this, however, there can be little doubt from the number of their instruments; though, as the interpretation would have been a most difficult affair, we have less reason to lament the thefts that time has made in this particular instance.

THE LATE DR BOWDITCH.

OF NATHANIEL BOWDITCH, the eminent American translator and editor of Laplace's *Mécanique Céleste* (Mechanism of the Heavens), who died in his sixty-fifth year, on the 16th of March 1838, the following biographic sketch is presented in the North American Review for January last, as a concluding note to a review of his literary and scientific services:—

"It was from an humble condition in early life, that (in part, no doubt, by force of extraordinary natural endowments, but also by force of a principled energy, alert to take advantage of every opportunity of improvement, and refusing to be depressed by any discouraging circumstances) Dr Bowditch rose to be one of the most eminent persons of his country, and of the time. The son of a working cooper, enjoying no advantages of instruction in early childhood beyond those of attendance on a public school, and those only till he was ten years of age, he was, two or three years after, apprenticed to a ship-chandler, and continued in this service through his minority; at the end of which time he went to sea, as an inferior officer in a merchant vessel. Meanwhile, by the diligent use of such fragments of time as he was able to redeem for study, from regular daily employment of so different a kind, he had (besides laying up stores in general literature, which would have done no discredit to a youth devoted to that pursuit) made such proficiency in his favourite science, as enabled him, three years after, to publish a work, the 'Practical Navigator,' scarcely surpassed in usefulness by any of the time, and immediately driving all others of the same class out of circulation. Being unable to purchase books, he borrowed and copied such as he most needed, possessing himself thus, before he was fourteen years old, of a long treatise on Algebra, another on Geometry, and a third on Conic Sections. At fifteen, making all the necessary calculations, he had arranged an Almanac, complete in all its parts. Obtaining, by a fortunate accident, a copy of Newton's 'Principia,' he learned Latin by himself, that he might read the work, and made a translation of the whole of it.

Entering upon an active life of business, Dr Bowditch made four voyages to the East Indies, and one to Europe, diligently devoting his leisure at sea to his favourite inquiries, which, however, with a liberal sense of the value of other knowledge, he diversified by studies of a more generally attractive kind. Retiring from a seafaring life at the age of thirty, he assumed an office, that of President of an Insurance Company in his native town, which, to most men, would have seemed to afford sufficient employment for their time; and from this, at the end of twenty years, he was transferred to the place of Actuary of the Massachusetts Life Insurance Company, which he held till the time of his death. It was by an economy of the leisure hours of a life thus engaged, that Dr Bowditch won for himself one of the highest names in science, which the nineteenth century boasts.

Nor was it by any jealous and churlish economy of those hours. No man acknowledged more readily the claims of friendly intercourse; no man welcomed more cordially the interruptions which they bring. His study was his parlour, where no posture of a hard unfinished problem ever caused the unexpected guest to feel that his visit was untimely. No abstraction ever revealed the toiling or wearied mind. A gay buoyancy of spirits, and a prompt interest in whatever subject was presented, showed, whenever you found the man, that you found him before his work, and at his ease. Early hours, an utter abstinence from mere waste of time, and temperate habits which preserved the mind in perpetual vigour, permitted a life crowded with labour and its

fruits to be, in an equal degree, tranquil, free from care, and accessible to incidental engagements.

Along with great heartiness, Dr Bowditch had its usual attendant, a warm impetuosity of character; and, though no 'rude and boisterous captain of the sea,' there may have been occasions when a happier combination would have been produced, had the same measure of the *fortiter in re* been blended with more of the *suaviter in modo*. But his high and rigid integrity was beyond question. His punctilious justice in the conduct of complicated affairs was a model for imitation. If he had prejudices, he had candour to welcome and weigh the evidence which would dispel them; and anger he carried 'as the flint bears fire;' the spark was quick, but it was momentary.

Acquiring what in a frugal community may deserve to be called wealth, he had the high wisdom to know its worth; that is, to know its uses. He cared for it as making him independent, and enabling him to be useful. In his life, as well as at his death, he gave freely from it to worthy objects of benevolence, public and private; and he expended a large portion of it, without any hope of remuneration, on the publication of his great work; declining, from a nice sense of honour, the urgent proposals of a learned society (the American Academy), and of private friends, that he would permit it to be issued at their charge. Of his time, his counsels, and his influence, he was as liberal, for good objects, as of his money.

Proof against less mischievous delusions, the madness of the 'undevout astronomer' had no place in his clear and sober mind. The Christian faith, the support of his principles through a long active life, was a sufficient source of consolation to him during the well-understood approach of death. Of cant and pretension, no man ever had less. But he had as little respect for the affectation which suppresses and disguises cherished sentiments, as for that which obtrudes and parades them. He thought it due to the truths which sustained him, to allow it to be known that it was on them that he leaned; and the chamber of his decline was a scene of the sublimest instruction for whoever would know, with what serene, magnanimous satisfaction, the spirit, which has well done the first part of its work, may pass on to its higher destinies."

LITTLE SNOWDROP.

A STORY FOR LITTLE FOLKS.*

ONE cold winter day, when the snow-flakes were falling like feathers from the sky, a good queen sat sewing at a window, which had a framework of black ebony. And as she sewed, and looked through the black framework at the snow, she pricked her finger with the needle, and three drops of blood fell upon the white linen. Then thought the queen within herself, "Oh that I had a child as white as snow, as red as blood, and as black as the ebony framework!" Not long after, a little daughter was given to her, that was as white as snow, as red as blood, and had hair as black as ebony, and therefore was called LITTLE SNOWDROP. Soon after, the good queen died; and when a year had passed away, the king took to himself another spouse. She was a beautiful woman, but vain and tyrannical, and could not endure that there should be any body in the world that was thought to be more beautiful than herself. Now, she had a wonderful looking-glass, and when she went and looked at herself in it, and said,

"Glass, glass, that hangs on the wall,
Who in the land is the fairest of all?"

the looking-glass answered,

"Lady Queen, in the land thou art fairest of all."

Then was she content, for she knew that the looking-glass spoke the truth. Now, Little Snowdrop grew apace, and became every day more lovely, and when she was seven years old, she was as beautiful as day, and more beautiful than the queen herself. So it was, that when one day the queen asked her looking-glass again,

"Glass, glass, that hangs on the wall,
Who in the land is the fairest of all?"

it answered,

"Lady Queen, thou art fair as fair may be,
But Snowdrop's a thousand times fairer than thee."

When the queen heard this, she became pale with jealousy and anger. From that hour forward, as often as she looked upon little Snowdrop, her heart burned within her with hatred towards the maiden. Her jealousy and pride increased daily, and at last became so great that she could not even rest at night. Then she sent for a servant, and said to him, "Take the child out with you into the forest; I cannot bear the sight of her. And when you get to the forest, kill her, and bring me back her lungs and liver as a token that you have done so." The servant did as he was bid, and carried Little Snowdrop away to kill her. But when he had drawn his dagger, and was going to plunge it into the child's heart, she began to weep, and said, "Oh, good man, spare my life; I will run about in the wild wood, and never more come home again!" Little Snowdrop was so young and so beautiful that the servant had compassion upon her, and said, "Run away, then, my poor child. The wild beasts will soon have eaten thee up." In his heart, however, he was right glad that he had not killed the child, and as a young fawn just then came bounding past, he struck it down, took out its lungs and liver, and brought them to the

* Translated for this work from the German.

queen. The cook was ordered to salt and dress them, and the wicked woman ate them up, and thought that she had eaten Little Snowdrop's lungs and liver.

The poor child was now all alone in the wide forest, and in such distress that she trembled all over. She looked and looked at the leaves upon the trees, and did not know how to help herself. At last she began to run over the sharp stones, and through the briars and thorns; but though the wild beasts crossed her on her way, yet they did her no harm. She ran as long as her feet could carry her, and night was about to close in when she saw a little house, and went in to rest herself. In the house every thing was small, small, but pretty and neat, as nobody can tell. In it stood a little table, spread with white, and seven little plates upon it, every plate with its spoon, and seven little knives and forks, and seven cups besides. Against the wall were seven little beds ranged all along, covered with sheets that were white as snow. Little Snowdrop, being very hungry and thirsty, ate out of every plate a little cress and bread, and drank from every cup a drop of wine; for she did not wish to take the whole away from one only. After that, because she was so tired, she lay down in one of the little beds, but none of them fitted; one was too long, another was too short; but at last the seventh was just the size. So she laid herself down in it, and after saying her prayers, fell fast asleep. When it was quite dark, came the masters of the house, who were seven dwarfs, that dug and delved for ore in the mountains. They lighted their seven little candles, and by the light they saw that some one had been in their house, for nothing was standing in the same order that they had left it. The first said, "Who has been sitting on my chair?" The second, "Who has been eating off my plate?" The third, "Who has taken a bite out of my cookie?" The fourth, "Who has been eating my cresses?" The fifth, "Who has been using my fork?" The sixth, "Who has been cutting with my knife?" The seventh, "Who has been drinking out of my cup?" Then the first looked round, and saw a little hollow in his bed, and he said, "Who has been into my bed?" The others came running, and cried, "Somebody has been lying in mine too!" But the seventh, when he looked into his bed, beheld Little Snowdrop, who was lying there fast asleep. Then he called the others, who came running up, and cried aloud for very wonder, and held up their seven little candles to look at Little Snowdrop. "Oh, good heavens! oh, good heavens!" they exclaimed, "what a beautiful child!" and so great was their delight, that they could not think of waking her up, but let her sleep on in the little bed. And the seventh dwarf slept with his companions, hour about, and so passed the night.

When it was morning, Little Snowdrop awoke, and when she saw the seven wee men, she was greatly afraid. But they were kind and gentle to her, and asked, "What is your name?" "My name is Little Snowdrop," she answered. "How did you come into our house?" asked the seven wee men once more. Then the child told them how her stepmother had wished to put her to death, but that the servant had spared her life, and after that she had run the whole day, till at last she had come to their little cottage. "If you will manage our house for us," said the dwarfs, "cook, make the beds, wash, sew, and stitch, and keep every thing clean and tidy, you may stay with us, and you shall never want for any thing." Little Snowdrop promised, and remained with them. She kept their house in the best order. Every morning they went to the mountains in search of ore; in the evening they came back, and then their meal must be ready for them. All the day through, the maiden was alone, but the good little dwarfs warned her, and said, "Take heed of your stepmother, who will soon learn that you are here; therefore let nobody in."

Now, the queen, who thought that she had eaten Little Snowdrop's lungs and liver, never dreamt but that she was the first and fairest lady in the world. So she stood before her glass, and said,

"Glass, glass, that hangs on the wall,
Who in the land is the fairest of all?"

But the glass answered,

"Lady Queen, thou art fair as fair may be;
But Little Snowdrop that lives in the glen,
Over the hills, with the seven wee men,
Is a thousand times fairer still than thee."

Then she was afraid, for she knew that the glass never spoke untruth. She also saw that her servant had deceived her, for that Little Snowdrop was still alive. So she hated poor Little Snowdrop only so much the more, and set about devising some fresh plan for her destruction; for as long as she was not for certain the fairest in all the land, she could not rest. She coloured her face, put on the dress of an old huckster-wife, and made herself so that no one could have known her. In this disguise she went across the seven mountains to the cottage of the seven dwarfs, knocked at their door, and cried, "Fine wares to sell! cheap and good—fine wares to sell!" Little Snowdrop peeped out of the window, and said, "Good day, my good woman! What have you got to sell?" "Good wares, pretty wares!" answered she; "snoods of all colours, my pretty maid!" With that she took out one that was twined of party-coloured silk. "I may let the honest woman in," thought Little Snowdrop, and thereupon undid the bolt, and bought the bonny mood. "Child," said the old woman, "how pretty you look! Come, I'll put it on nicely for you!" Little Snowdrop had no suspicion; so she stood up, and let her fasten on the snood; but the old woman threw it hastily over

her neck, and pulled and pulled so hard, that at last Little Snowdrop lost her breath, and she sank down as if she were dead. "Take that for being the fairest!" said the hag, and hurried away. Not long after, at eventide, the seven dwarfs came home, and great was their dismay to find their dear Little Snowdrop lying upon the ground, stiff and motionless as if she were dead. They lifted her up, and seeing the snood bound so tightly on, they cut it asunder, upon which she began once more to breathe, and by little and little came back to life. When the dwarfs heard what had happened, they said, "The old hucksterwife was nobody but the queen; take care not to let any body in when we are not with thee!"

Now, the wicked woman, whenever she got home, went to her glass, and asked,

"Glass, glass, that hangs on the wall,
Who in the land is the fairest of all?"

Then the glass answered,

"Lady Queen, thou art fair as fair may be;
But Little Snowdrop that lives in the glen,
Over the hills, with the seven wee men,
Is a thousand times fairer still than thee."

When the wicked queen heard this, all her blood ran to her heart, she was so dismayed, for she knew well that Little Snowdrop was alive again. "But now," she said, "will I fall upon a plan to destroy her without fail," and with the witches' arts, which she understood, she made a poisoned comb. Then she dressed herself up in the disguise of an old woman, and away she went across the seven mountains to the seven dwarfs, knocked at their door, and cried, "Fine wares to sell—cheap and good, fine wares to sell!" Little Snowdrop looked out and said, "Pass on your way, my good woman; I don't let any body in." "Nobody can blame you for looking at least," said the old woman, as she drew out the poisoned comb, and held it up. The simple child was so taken with it, that she let herself be befooled, and opened the door. When she had looked at the comb, and fingered it in every way, the old woman said, "Now, I will put in the comb nicely for you!" Poor innocent Little Snowdrop gave the old woman leave; but scarcely had it been fixed in her hair, when the poison began to work, and she fell senseless to the ground. "Thou paragon of beauty, now is thy fate sealed!" said the wicked woman, and went away. By good luck it was not far from evening, when the seven dwarfs came home. When they beheld Little Snowdrop lying upon the ground, as if she were dead, they at once suspected the wicked stepmother. They accordingly made a search, and found the poisoned comb; and when they had drawn it out, Little Snowdrop came to herself again, and told them what had passed. Then they entreated her once more to be upon her guard, and not to open the door to any one.

As soon as she got home, the queen stationed herself before her glass, and said,

"Glass, glass, that hangs on the wall,
Who in the land is the fairest of all?"

Then it answered, as before,

"Lady Queen, thou art fair as fair may be,
But Little Snowdrop that lives in the glen,
Over the hills, with the seven wee men,
Is a thousand times fairer still than thee."

When she heard the glass speak this way, she trembled, and shook with rage. "Snowdrop shall die," she exclaimed, "though it cost me my own life!" With this she went into a secret lonesome chamber, and there made an apple, that looked beautiful on the outside—white it was, with rosy cheeks—so that whoever gazed on it, longed for it; but inside, one-half of it was so poisoned, that whoever took even the smallest piece of it into his mouth, was sure to die. When the apple was ready, she painted her face, disguised herself as a peasant woman, and so away across the mountains to the cottage of the seven dwarfs. She knocked, and Little Snowdrop stretched her head out of the window, and said, "I don't let any body in; the seven dwarfs have forbidden me." "Very well," answered the peasant woman, "I only want to get quit of my apples. There is one as a present for you!" "No!" said Little Snowdrop, "I dare not take any thing." "Oh, I suppose you think it poisonous," said the old woman. "Look you, I will cut the apple in two; do you eat the red cheeks, I will eat the white." And as she said this, she held out the poisoned half of the apple. Little Snowdrop felt a great longing for the beautiful apple; and when she saw the peasant woman eat a piece of it, she could resist no longer, but stretched out her hand, and took the poisoned half. Scarcely had she taken a bite of it into her mouth, when she fell down dead. The queen gazed upon her with a look of triumph, laughed long and loud, and said, "White as snow, red as blood, black as ebony! this time the dwarfs cannot waken you again." And when she inquired of the glass at home,

"Glass, glass, that hangs on the wall,
Who in the land is the fairest of all?"

it answered at last,

"Lady Queen, in the land thou art fairest of all."

Then her envious heart was at peace, as far as an envious heart can be at peace. The seven little men, when they came home at night, found Little Snowdrop lying on the ground. There was not a breath stirring in her. She was dead. They lifted her up, examined if there was any thing poisonous about her, undid her dress, combed her hair, washed her with water and wine; but it was all in vain. The dear child was dead—quite dead. They placed her upon a bier, and they all seven sat round about, bewailing their dear Little Snowdrop, and they wept three whole days long. After that they

would have buried her, but that she still looked as fresh as a living creature, and still retained her beautiful red cheeks. "We cannot bury this still lovely creature in the black earth," they said; and so by their art they made a transparent coffin of glass, where you might see in from every side. In this coffin they laid Little Snowdrop, and upon it wrote her name in golden letters, and that she was a king's daughter. Then they set the coffin out upon the mountain, and one of them always remained beside it, and kept watch. And the beasts came too, and mourned for Little Snowdrop—first an owl, then a raven, and last of all a dove. Little Snowdrop lay a long long time in the coffin, and did not change, but looked as though she were asleep; for she was still as white as snow, as red as blood, and had hair as black as ebony.

Now, it fell out that a king's son chanced to hunt in the forest, and came to the house of the seven dwarfs to pass the night there. He saw the coffin upon the mountain, and the beautiful Little Snowdrop inside, and read what was written upon it. Then he said to the little men, "Let me have the coffin. I will give you whatsoever you desire for it." But the little men answered, "We would not give it for all the gold in the world." Then he said, "Do give it me, for I cannot live without seeing Little Snowdrop; I will honour and esteem it as the thing nearest to my heart." Hearing him speak thus, the good dwarfs felt compassion for him, and gave him the coffin, and the king's son ordered his attendants to bear it away upon their shoulders. It so happened that they stumbled over a bush; and with the shock, the piece of the poisoned apple which Little Snowdrop had bitten, fell out of her mouth, and she came to life again. Then she raised herself up, and said, "Kind heavens! where am I?" "Thou art with me!" exclaimed the king's son, full of joy, and told her what had happened. "I love thee dearer," he said, "than all the world besides. Come with me to my father's castle; thou shalt be my bride." Little Snowdrop consented, and went along with him, and their marriage was celebrated with great solemnity and splendour.

Now, Little Snowdrop's stepmother was invited to the feast with the rest; and when she had decked herself in her finest attire, she went to her glass, and said,

"Glass, glass, that hangs on the wall,
Who in the land is the fairest of all?"

then the glass answered,

"Lady Queen, thou art fair as fair may be,
But the young queen's a thousand times fairer than thee."

Upon this the wicked woman fell into such a fit of rage that she appeared as if about to lose her senses. When able to reflect a little, she was at first inclined to stay away from the marriage; but, after all, she could not rest till she went and beheld the young queen that was fairer than herself. When she entered, she recognised Little Snowdrop, and stood stock still with terror and dismay. Meanwhile, a pair of iron slippers, that had been heated in a fierce coal fire, were brought in, and these fiery-red shoes the queen was forced to put on, and to dance in them, until her feet were piteously burnt. Neither was she permitted to stop until she had danced herself to death.

CIVILISING INFLUENCES OF COMMERCE.

THE influences of commerce in extending the limits of civilisation, in both the past and present ages of the world, are admirably set forth in the following passages from an Address delivered before the Mercantile Library Association, at Boston, September 13, 1833, by Governor Everett.

"When we contemplate the past, we see some of the most important phenomena in human history intimately connected with commerce. In the very dawn of civilisation, the art of alphabetical writing sprang up among a commercial people. One can almost imagine that these wonderfully convenient elements were a kind of shorthand, which the Phœnician merchants, under the spur of necessity, contrived for keeping their accounts; for what could they have done with hieroglyphics of the Egyptian priesthood, applied to the practical purposes of a commerce which extended over the known world, and of which we have preserved to us such a curious and instructive description by the prophet Ezekiel? A thousand years later, and the same commercial race among whom this sublime invention had its origin, performed a not less glorious part as the champions of freedom.

When the Macedonian madman commenced his crusade against Asia, the Phœnicians opposed the only vigorous resistance to his march. The Tyrian merchants delayed him longer beneath the walls of their sea-girt city, than Darius at the head of all the armies of the East. In the succeeding centuries, when the dynasties established by Alexander were crumbling, and the Romans in turn took up the march of universal conquest and dominion, the commercial city of Carthage, the daughter of Tyre, afforded the most efficient check to their progress. But there was nowhere sufficient security for property in the old world, to form the basis of a permanent commercial prosperity. In the middle ages, the iron yoke of the feudal system was broken by commerce. The emancipation of Europe from the detestable sway of the barons, began with the privileges granted to the cities. The wealth acquired in commerce afforded the first counterpoise to that of the feudal chiefs who monopolised the land, and in the space of a century and a half gave birth to a new civilisation. In the west of Europe, the Hansa towns; in the east, the cities of Venice, Genoa, the ports of Sicily and Naples, Florence, Pisa, and Leghorn, began to swarm with active crowds. The Mediterranean, deserted for nearly ten centuries, is covered with vessels. Merchants from the Adriatic explore the farthest east:

silks, spices, guns, gold, are distributed from the Italian cities through Europe, and the dawn of a general revival breaks on the world. Nature, at this juncture, discloses another of those mighty mysteries, which man is permitted from age to age to read in her awful volume. As the fulness of time approaches for the new world to be found, it is discovered that a piece of steel may be so prepared, that it will point a steady index to the pole. After it had led the adventurers of Italy, Spain, and Portugal, to the utmost limits of the old world—from Iceland to the south of Africa—the immortal discoverer, with the snows and sorrows of near sixty years upon his head, but with the fire of immortal youth in his heart, placed himself under the guidance of the mysterious pilot, bravely followed its mute direction through the terrors and the dangers of the unknown sea, and called a new hemisphere into being.

It would be easy to connect with this discovery almost all the great events of modern history, and, still more, all the great movements of modern civilisation. Even in the colonisation of New England, although more than almost any other human enterprise the offspring of the religious feeling, commercial adventure opened the way and furnished the means. As time rolled on, and events hastened to their consummation, commercial relations suggested the chief topics in the great controversy for liberty. The British Navigation Act was the original foundation of the colonial grievances. There was a constant struggle to break away from the limits of the monopoly imposed by the mother country. The American navigators could find no walls or barriers on the face of the deep, and they were determined that paper and parchment should not shut up what God had thrown open. The moment the war of independence was over, the commercial enterprise of the country went forth like an uncaged eagle, who, having beaten himself almost to madness against the bars of his prison, rushes out at length to his native element, and exults as he bathes his undazzled eye in the sun-beam, or pillows his breast upon the storm. Our merchants were far from contenting themselves with treading obsequiously in the footsteps even of the great commercial nation from which we are descended. Ten years had not elapsed from the close of the revolutionary war, before the infant commerce of America had struck out for herself a circuit in some respects broader and bolder than that of England. Besides penetrating the remotest haunts of the commerce heretofore carried on by the trading nations of Europe—the recesses of the Mediterranean, the Baltic, and the White seas—she displayed the stars and the stripes in distant oceans, where the Lion and the Lilies never floated. She not only engaged with spirit in the trade with Hindostan and China, which had been thought to be beyond the grasp of individual capital and enterprise, but she explored new markets on islands and coasts before unapproached by modern commerce."

THE STOLEN GIPSEY GIRL.

A NUMBER of years ago, two little girls, each about the age of five or six years, disappeared about one and the same time from the houses of their respective parents, who lived at separate and distant points in the south of France. The cause for the disappearance of these children was the same in both cases; namely, the dread of domestic correction for some trifling fault. Marguerite Cogordan, one of the girls, was taken away from the town of Valensole by a band of gipsies, who met the child at a fair there, and found her not unwilling to go with them. For nearly twenty years, Marguerite Cogordan lived with the gipsies, passing with them from place to place, but always retaining an indistinct recollection of her native spot, though she had forgot its name. Her longings to return to her parents, and her imperfect remembrances, were treated by those around her as the ravings of insanity.

At length Marguerite left the company of gipsies, and got into service with a judge of the town of Carcassonne, also in the south of France. To her new master the girl disclosed the wandering reminiscences that preyed on her mind respecting her home and friends. The judge pitied the young woman, and paid every attention to her statements, with the view of discovering her relatives for her. At length it struck him that her descriptions of scenery applied to the district of the Lower Alps, and he addressed letters to a chief magistrate of Digne, the chief town of the department. The party addressed knew of no case where a girl had disappeared from Digne, but he chanced to remember that the name of Cogordan was not an uncommon one in the little neighbouring town of Valensole, and wrote to Carcassonne, stating this fact to Marguerite's master, and adding that her description of the scene of her birth applied perfectly to Valensole.

Upon receipt of this information, the judge set out with Marguerite Cogordan for Valensole, and at once found a family there, which had sustained the loss of a child, suiting Marguerite every way in name and age. But a strange circumstance overthrew the poor girl's hopes. The parents, while admitting that they had once lost their child, declared at the same time that they had long since recovered her, and produced a young woman whom they called their daughter. The unfortunate Marguerite was rejected by the parents; they looked coldly on her, and repulsed the testimonies of her affection. This cruel and unexpected disavowal threw the poor young woman into a violent fever. This warmth of feeling smote upon the hearts of the parents. They began to doubt, and, finally, opened their arms to the new-comer, declaring their belief that she was their own—their real child.

Hitherto the false Marguerite had held her peace, or, at least, had made no confession to explain the mystery. But being now closely interrogated, she avowed that her name was Baptistine Barlelet, and that she was the daughter of a fisherman at Marseilles. She had left her home, she stated, when a child, and had been picked up by a blind fiddler, with whom she had travelled for several years up and down the country. Passing one day through Valensole, three years after the disappearance of Marguerite Cogordan, the parents of that girl had seen her, believed they recognised her to be their daughter, and

had claimed her as such. Fearing to be sent back to a home where she had been ill used, she had given countenance to the deception, and had kept her real name secret. She remained with the Cogordans, and custom had at length made her feel as if she were truly in her own home. Once, indeed, she had tried to find service some where else, but she had been brought back.

This disclosure made Marguerite Cogordan happy, and she now (1837 being the date of these events) lives with her long-lost parents.

"DEAR THIRTY-NINE."

"Dear Thirty-Nine!" "So farewell, poor Thirty-Nine!" "Farewell, poor Thirty-Nine! what a portion of my life has been spent in thee! Thou hast sheltered me from the prime of life to its decline, and now I must bid good bye to thee!"—*Sir Walter Scott's Diary.*

[The following verses were suggested by these affectionate allusions of Sir Walter Scott to his house in North Castle Street, Edinburgh, and by the neglect in which we now hold what will one day assuredly be an object of deep interest.]

Unhonoured by the passing throng,
Dear Thirty-Nine, thou art,
Unhonoured, haply, wilt be long,
Though genius, soul, and heart,
Wisdom, and wit, and heavenly song,
Might well to thee impart
A fitting power the passer's breast to warm,
If e'er such attributes to stone gave such a charm.

A spirit of diviner mould
Was never lent to earth,
To hallow mountain, lake, and wold,
To brighten hall and hearth—
To draw sweet wisdom from things old,
And give new treasures birth—
Than that which breathed erewhile within these walls,
Freighting each breath with tales and pleasant madrigals.

Strange things are we!—that ever look
With scorn upon our own,
And only such grey wrecks can brook
As Time has overthrown:—
Yea, as we love the stunning rook
That maketh old trees known,
So hold we ev'n deformities most dear,
When we through them are told, that "Time's hand has been here!"

On him, dear Thirty-Nine, who passed
Beneath thy roof his prime,
Not yet is planted, firm and fast,
The current stamp of time:
Still on the air the moanings last
Of that funeral chime.

Which pealed above his newly hearsed remains,
Mingling with sounds of wail from all old Scotland's plains.

Not yet on him hath sifting age
Its charter-seal impressed:
But, though for others such a gage
May well be in request,
His, surely, and his glorious page,
Needs not old Time's attest,
So high he soared above his whole compeers,
One of the great who rise, once in a thousand years.

Yet ev'n with him doth tyrant use
Still vindicate its right,
And every careless passer views,
As some base common sight,
This modern temple of the muse,
The source whence such delight
As never welled from one sole fount before,
Flowed o'er the charmed earth, like sea without a shore.

A potent rival, it is true,
Dear Thirty-Nine, thou hast,
A rural pile o'er which he threw
A glory doomed to last;
And herefrom partly may accrue
Less reverence for the past,
Less keen remembrance of the scenes bygone,
With which thou wert mixed up, and wert mixed up alone.

But come there surely will a day
When thou shalt have the meed
Of honour due from grave and gay,
From all whose eyes can read:
Yea! every stone thy walls display
Shall yet be as a creed
By which the pilgrims of the earth shall swear,
While musing on the mighty one, once dwelling there.

With fondest love Ferrara keeps
Her Ariosto's chair,
And o'er his sculptured ink-vase weeps,
Whence issued streams so rare;
And we—whose bard clamb loftier steepes,
And breathed sublimer air—
We shall not long neglect this sacred shrine,
Our northern Ariosto's home, dear Thirty-Nine!

T. S.

BRAZILIAN VESPER BELL.

In Brazil, all journeys are suspended at the Ave Maria, that is, the vespers to the virgin, which commence after sunset. Instead of a curfew, a very simple and pleasing circumstance announces this period in the country. A large beetle (called *Pelidnota testacea*), with silver wings, just then issues forth, and, by the winding of its small but solemn and sonorous horn, proclaims the hour of prayer. A coincidence so striking, and so regular and frequent in its occurrence as this, was not likely to escape the honour of a religious superstition to account for it. Accordingly, the Brazilians regard it as a sacred institution, supposing that the insect is a herald expressly commissioned by the Virgin to announce the time of her evening prayer. Hence it is constantly called *Escaravelhod* Ave Maria, that is, the Ave Maria Beetle. "On the hill

of Santa Theresa," says Dr Walsh, "I have heard it of an evening humming round the convent, and joining its harmonious base to the sweet chant of the nuns within at their evening service."

A RUSSIAN MOTHER.

The maintenance of military fidelity and discipline seems to the present Emperor of Russia an object for which all human ties may well be sacrificed. In March 1837, a woman named Maria Nikoforesco, the widow of a peasant, received a letter from her son Novik, a soldier in the stationary battalion of Tambow. In this letter the son stated that the barbarous treatment which he and others endured at the hands of the regimental officers, had driven him to the resolution of deserting from a service into which he had been forced at the first, and that, in a few days after the date of his communication, he hoped to see and embrace his mother. The first thing done by the mother on receipt of this letter was to carry it to the governor of the province, who, astonished at the unnatural character of the action, sent the woman away without taking any steps in consequence of her disclosure. Some days later, the deserter arrived at the dwelling of his mother, who received him with open arms, and loaded him with caresses. But she took an opportunity immediately afterwards to go to the police officers, to whom she delivered up the child to whom she had given birth, and whom she had nursed at her breasts. Compelled by his duty, the governor addressed a detailed report of the case to the emperor. Nicholas viewed the matter differently from the governor. The autocrat issued an *ukase*, decreeing a silver medal to Maria Nikoforesco, with these words engraven on it, "Devotion to the Throne." This medal was to be suspended from her neck by the ribbon of the Order of St Anne, and the woman was further secured, for the rest of her life, against the chances of want. It was moreover decreed that the circumstances of the case should be published in all the journals of the empire, that its subjects might imitate this example of fidelity and devotion to the throne.

The young soldier, in accordance with the military regulations of Russia, was subjected to the knout, and died under the blows. The unnatural parent wears the decoration assigned to her, with as much pride as if she had won it by the most virtuous action.

MIGRATORY EXPEDITION OF ANTS.

The ant cities, as they ought to be called, of Brazil, are of such amazing size, that they have more the character of structures reared by human hands, than that of monuments of insect industry and skill. They are conical mounds of clay, which their tiny architects rear to the height of ten or twelve feet; their circumference is nine or ten feet. A hard yellow clay forms the external coat; the inside is divided by a number of horizontal floors or stories, of a hard black earth, in thin plates, which sometimes shine like Japan-ware. These habitations are peopled by myriads of ants of a large size, and a brown colour. They have the power of exuding from their bodies a viscid fluid, by which they moisten the clay to a consistency fit for making floors. Some species form covered ways in this manner, and tunnels or avenues of this description have been found stretching for a considerable distance from one settlement to another, and through these the ants are enabled to make pretty long journeys unseen. They sometimes migrate, and their expeditions are attended with truly remarkable circumstances. In fact, they resemble on a small scale the invasions of Attila and his million of mounted barbarians into the fruitful and glowing plains of Italy—leaving a parched desert in their wake. When these insect Huns set out in such enterprises, they proceed right forward in a straight line, just as the laden bee flies to its hive, and they devour every thing in their way which is eatable, like a cloud of locusts "warping on the wind." It once happened, during one of these expeditions which was undertaken near the city of Rio de Janeiro, that a garden obstructed their line of march—a deep ditch of water in particular seemed an insurmountable obstacle; however, a stick happened accidentally to be lying across it; this the ants used as a bridge, and over it they poured by myriads, so that in a few hours the garden was swarming full of them, and every thing of vegetable kind disappeared. From this they proceeded on till they came to the house of the Swedish consul, through which they actually made their way. The gentleman who inhabited it was suddenly awakened during the night by a horrid sensation, and starting from his couch, he found himself covered with these insects, whose crawling and biting had awoke him. The house was full of them; there was neither recess nor apartment nor closet exempt from their presence. Impelled by their instinctive tendency to advance, they pursued their onward course until the whole body passed through, and next morning not a single one of them was to be seen. Strange to say, the ants devoured every other insect in their progress, so that the singular visitation was not without its use. Spiders, cockroaches, and every thing of the kind which infested the house, became the prey of these nocturnal visitors; and when they disappeared, it was found that every other species of insect had disappeared along with them.

WALKING.

Walking is the best possible exercise: habituate yourself to walk very far. The Europeans boast of having subdued the horse to the uses of man, but I doubt whether we have not lost more than we have gained by the use of that animal. No one has occasioned so much the degeneracy of the human body. An Indian goes on foot nearly as far in a day, for a long journey, as an enfeebled white does on his horse, and he will tire the best horses. A little walk of half an hour in the morning, when you first rise, is advisable. It shakes off sleep, and produces other good effects in the animal economy.—*Jefferson's Memoirs.*

VESTIGES OF UNRECORDED NATIONS IN AMERICA.

THE white people now spreading over the great valley of the Mississippi, have apparently found nothing in the country to surprise them more than the existence of an immense quantity of artificial mounds of various shapes and sizes, extending all the way from the Canadian lakes down into Mexico, and the origin of which is a complete puzzle to the wisest heads amongst the new people. This country, as is well known, was found, in the earlier periods of American discovery, in the possession of those red races, usually called Indians, who are now retiring before the advance of the whites. These red races manifest no symptom of possessing, or of ever having possessed, either the power or the inclination to erect such works: they disclaim having erected them, and in their traditions speak of them as the production of a people who were their predecessors in the country, and have long been extinct. As might be expected of a matter so well calculated to excite wonder and surmise, it has been, even in busy America, very eagerly investigated, particularly by individuals connected with the American Antiquarian Society—for, let not the reader be startled, there is such a society—and, the fruits of these inquiries being now in one shape or another brought under our attention, we propose to present to our readers a brief sketch of all that is known on the subject.

Commencing a survey of the North American continent from the north-east, the first earth-work occurs on the south side of Lake Ontario, near the Black River, within the state of New York. From this point, similar works are traced towards the south-west, along the borders of Lake Erie, along the course of the Ohio, to the Mississippi—along that river also, and so on, across Texas, into Mexico, and even farther than that, for the series, we are informed, has also been traced into South America. What is very remarkable, they increase both in number and magnitude towards the south, until, from being humble on the Lakes, they come to be described in Mexico as magnificent. There are similar works, and also some of a considerably different nature, on Lake Michigan, both in its east and west shores, and all down the Wisconsin and Mississippi rivers, till they join the series traced on the Ohio. The region in which the Illinois, Missouri, Mississippi, and Ohio, meet—a district in the very centre of the North American continent—peculiarly abounds in these ancient works. They are mostly found on good ground in the neighbourhood of rivers—rarely in barren grounds, and there they are invariably small.

The earth-works of Lakes Ontario, Erie, the Ohio, Mississippi, and more southern regions, are of three kinds chiefly, which we shall describe as Enclosures, Tumuli, and Ramparts. The Enclosures are regarded as forts, and popularly are so called. Near the lakes they are small, enclosing only a few acres, and presenting walls only a few feet in height. Farther south, and on the Ohio, they sometimes enclose as much as forty acres, and appear to have been strongly fortified. From Lake Erie southward, there is one continuous chain, in which they are never more than four or five miles apart. Near Newark in Licking county, the works of this kind are of great extent. "A fort nearly in the form of an octagon, enclosing about forty acres, constructed of walls ten feet high, is connected with a round fort of twenty-two acres, by parallel walls of equal height. Similar walls form a passage to the Licking river northerly, and run in a southerly direction to an unexplored distance. A like guarded pass-way, 300 chains in length, leads to a square fort containing twenty acres, which is in the same manner connected with a round one containing twenty-six acres. At the extremities of the outer passes, are what may be called round towers; and adjacent to one of the forts is an observatory partly of stone [a square mound] thirty feet high. It com-

manded a full view of a considerable part, if not all the plain on which these ancient works stand, and would do so now, were the thick growth of aged forest trees which clothe this tract cleared away. Under this observatory was a passage, from appearances, and a secret one probably, to the water-course which once ran near this spot, but has since moved farther off."

The works at Circleville are still more remarkable. There are two forts, one an exact circle, and the other an exact square. The former, from which the modern town seems to have derived its name, has a double wall, with a ditch between, the height of the walls from the bottom of the ditch being twenty feet. The diameter without the walls is sixty-nine feet. The inner wall is of clay, the outer of water-worn stones; and there is but one opening. The square fort has one wall, now about ten feet in height, and the area is fifty-five rods square. It has eight openings, before each of which there is a broad low mound, apparently designed for defence, and exactly parallel with the wall. The square fort lies very nearly conformable to the points of the compass, and both it and the circular one are formed with such mathematical correctness, that modern inquirers have in vain endeavoured to find the slightest error in the measurement.

Such are the Enclosures—the Tumuli are of three kinds. First, there are simple conical mounds, measuring in the north four or five feet in height, and ten or twelve in diameter at the base, but increasing in the more southerly regions to eighty or ninety feet in height. They are supposed to have been, like the cairns of Scotland, and the barrows of England and other European countries, the sepulchres of important men. Vases of calcareous breccia, armour of copper, and various implements, "of materials, of forms, and for purposes, unknown to any tribe of Indians who have inhabited that region for at least three centuries," are mentioned as found in the earthen mounds. In a second class of the Tumuli, namely, conical mounds composed of small stones on which no marks of tools are visible, there have been found "urns, ornaments of copper, heads of spears, &c., as well as medals of copper, and pickaxes of hornblende."† The third class of the Tumuli are described as pyramidal mounds, supposed to have been observatories or watch-towers. It is worthy of remark that this description exactly applies to a class of earth-works in Scotland, known by the name of moot-hills, on which justice was dispensed by the territorial magnates in times scarcely within the scope of history.

"These Tumuli, as well as the fortifications," says the writer in the work quoted below, "are to be found at the junction of all the rivers along the Mississippi in the most eligible positions for towns, and in the most extensive bodies of fertile lands. Their number exceeds, perhaps, three thousand; the smallest not less than twenty feet in height, and one hundred in diameter at the base. * * One nearly opposite St Louis [on the Mississippi] is eight hundred yards in circumference at the base, and one hundred feet in height. Mr Brackenridge noticed a mound at New Madrid of three hundred and fifty feet in diameter at the base."

The third class of earth-works resemble the walls of the forts, but form no internal area. They, in some instances, form short ramparts. In other instances, they are described as in double lines, extending for several miles, being apparently "designed as covered ways, for race-grounds, or for places of amusement."

In the neighbourhood of Lake Michigan, and between that lake and the Mississippi, there are remains of works somewhat different from the above. First, as to those on the east side of Lake Michigan. Here, we are told, throughout an extent of country a hundred and fifty miles long, from Grand River to Elks-

heart, as well as in some of the neighbouring districts, are found vestiges of what appear to have been "garden-spots, thrown into ridges and walks with so much judgment, order, and good taste, as to forbid a thought that they were formed by uncivilised man. * * I can find," says an observer, "several acres together, laid out into walks and beds, in a style which would not suffer by a comparison with any gardens in the United States. * * Scarcely a fertile prairie is found, on the margin of which we do not observe these evidences of civilisation." The timber growing on many of these spots, and some other circumstances, forbid the idea that they could have been formed by the early French settlers. The Indian tradition respecting them is, that they were cultivated by a race whom the present natives denominate Prairie Indians, who are said to have been driven from the country by the united tribes of Chippewas, Ottawas, and Potawatomes.

The antiquities of the region between Lake Michigan and the Mississippi are of a nature much more curious and interesting than any as yet described. Here, besides tumuli of the usual circular, quadrangular, and oblong shapes, there are found earth-heaps of large size, in which an attempt has been made to represent the forms of various animals! These abound particularly in the Iowa district of the Wisconsin Territory. They occur, mixed with the other varieties, in great numbers, around the high lands which skirt the Four Lakes, forming a species of *alto relievo* of gigantic proportions. Close beside the great Indian trail between Lake Michigan and the Mississippi, eighteen miles west of the Four Lakes, and seven east from the two remarkable natural hills called the Blue Mounds, there is an extremely interesting group of these animal-shaped earth-works, of which a drawing of the character of a ground plan is given in a late number of Professor Silliman's Journal. The animal shapes are six, of the respective lengths of 90, 100, 102, 103, 120, and 126 feet, each creature following, as it were, the other, except in one instance at the close of the singular procession, where the body of the animal is arranged at right angles to the rest. The outline of the animals is so rude, that it is only possible to discern that a quadruped is meant: at the same time, each pair of legs is represented by only one line of mound. Mixed with these figures, and in the same line with them (except in one instance), there are four oblong mounds, which may have been intended for animal shapes, but left without the head and legs. A few hundred feet in advance, a line of oblong mounds commences, including a shape, as of a man with his legs and arms stretched out, the length of which is 125 feet, and of the outstretched arms 140 feet. At the one end of this line is a tumulus or conical mound fifty feet high, and at the other a small circular mound. These monuments are covered with the same green carpet of prairie grass, intermixed with bright and brilliant flowers, as the prairie itself. Half a mile westward of the group, there occurs a solitary mound, about ninety feet in length, representing an animal, in all respects like those we have described, but lying with the head in a different direction. About the space of twenty miles from this position, extending to the Four Lakes eastward, similar monuments, intermixed with plain tumuli, are seen at almost every mile in the lowest situations, as well as crowning the highest swells of the prairies; and they are still more numerous all around those beautiful but almost unknown lakes. A remarkable example of the animal-shaped mound, ninety feet long, is placed at the foot and at the point of a conspicuous perpendicular bluff of coarse friable sandstone, fronting a rich meadow. In front of the effigy, is a straight mound, two hun-

dred yards in length, having an opening in the middle opposite the animal. The position of this earth-work is said to "indicate its having been designed for the purposes of defence or fortification against an enemy; perhaps as an outwork to the stronghold in the rear, formed by the bluff itself."

Six miles west of the Four Lakes, there are two figures, apparently of animals of a different species, there being tails, which were wanting in the former case, the body being longer in proportion to the legs, and the head rising above as well as sinking below the line of the neck. They are respectively one hundred and two and one hundred and twenty feet long. Beyond the Wisconsin Territory, on the north side of the river of that name, in the region still held by the Winnebagoes, are innumerable mounds, both of the circular and most of the other forms. At one position, near the river, and not far from English Prairie, a group of six of these appear to represent birds, having the wings expanded and the beak turned down *en profile*, and on a scale not less than that of the preceding figures. Forms supposed to represent turtles have also been seen in more than one situation, constructed on an equally large scale. In English Prairie, on the south bank of the Wisconsin, are earth-works, having the circular, the oblong, and the usual animal forms. Animal effigies occur fifteen miles to the southwest of the last-mentioned locality, along the course of an ancient trail, and also of the present military road from Prairie du Chien to Fort Winnebago. They occur abundantly in the vicinity of the Blue Mounds, which were, until very lately, a great resort of the Indian inhabitants; as their existing paths, converging hither in singularly straight lines from every point of the compass, amply testify. On the shores of Lac de Bœuf and Lac Apucaway, wherever the land is dry and sufficiently elevated, there may be observed, even from the water, a vast number of tumuli. Bones, in a decomposed state, have been found in such of these mounds as have been opened. At Crawfordville, on the Fox River, a great group was lately discovered. The mounds were from three to seventeen rods (280 feet) in length, generally about four feet high, and they are stated to resemble "lizards, alligators, and flying dragons." They all point in the same general direction, but are not precisely parallel. Much interest has been excited within the last few years in America by the discovery in the Wisconsin Territory of the remains of an ancient city, to which the name Aztalan has been given, from an idea that it may have been the capital of Aztalan, the country from which the Mexicans represented themselves to have come, when questioned on the subject by the Spaniards. What may be the appearances of this ancient city, we cannot tell; but we are informed that, for thirty miles round its site, there are numerous mounds and large embankments, the former resembling "lizards, turtles, buffaloes, and even the human form." Of all of these remains, the present Indian tribes are unable to give the least account. They have only held the country for about eighty years, previous to which it was occupied by the Sauks and Fox Indians, a branch of the Chippewas. They often bury their chiefs on the tops of the ancient mounds, but this, apparently, only from a principle of imitation. The decayed bones stated to have been found in these mounds, show that the bodies originally buried there were laid on the ground, and the earth then heaped over them. Mr R. C. Taylor of Philadelphia, the writer of the article in Silliman's Journal, from which we derive our account of the Wisconsin antiquities, suggests that the animal forms may have been designed heraldically, to commemorate the particular heroes there buried.

The American antiquaries have as yet arrived at no definite theory as to the people by whom these various earth-works were formed. That they originated in an age far beyond the date of the discovery of America by Columbus, is proved in a very interesting manner by the trees which are found growing on many of them. A white oak-tree, cut down by Mr McCoy on one of the garden mounds near Lake Michigan, and which was three feet two inches in diameter at two and a half feet above the ground, was found to be three hundred and twenty-five years old, if the real age of a tree is to be ascertained by the number of concentric circles in its timber. On the forts in the vale of the Ohio, trees have been cut down, showing as many as four hundred concentric circles, and which "appeared to be at least the third growth since the works were occupied." A very curious fact, proving the ancient occupation of the country by a race superior in the arts of life to the present Indians, is adduced in the *Archæologia Americana*. "Along the Ohio, where the river is in many places washing away its banks, hearths and fire-places are brought to light, two, four, and even six feet below the surface. A long time must have elapsed since the earth was deposited over them. Around them are spread immense quantities of mussel shells, bones of animals, &c. From the depth of many of these remains of chimneys below the present surface of the earth, on which, at the settlement of this country, grew as large trees as any in the surrounding forest, the conclusion is, that a long period, perhaps a thousand years, has elapsed since those hearths were deserted."

The only ray of light which comes to us on this dark question, is that which we derive from Mexican history. The race found by the Spaniards in Mexico represented themselves as having come from the north. Connecting this circumstance with the fact that the

earth-works improve in magnitude towards the south, we can scarcely resist the conclusion that these works were formed by the Mexicans, in their progress from the north towards their place of ultimate settlement. Whence these people came, is another question, and one which could not well be discussed within the short space now left to us. In conclusion, we can only express our earnest wish that the earth-works of America may be still more carefully investigated than they as yet have been, and that the results of these investigations may be liberally communicated through the proper channels, both by letter-press and picture, in order to enable European antiquaries to form their judgment upon the subject, with the aids they possess in the kindred antiquities of the elder hemisphere.

THE RISE OF A PACHA,

A STORY OF DAMASCUS.

THE annals of no other country on the face of the earth present us with such examples of men springing at once from poor estate to the summit of wealth and power, as those of the Ottoman empire. The manners and institutions of the Turks favour these sudden alterations of fortune; so much so, indeed, that the majority of the pachaliks attached to the Porte, and of all its high offices of state, have been for the most part filled, from time immemorial, by able adventurers, emancipated slaves, and men of the humblest origin. Of all the instances of rapid elevation, however, which the history of the empire exhibits, none perhaps was so remarkable in its character, and attended with so many strange circumstances, as that of Mohammed-Pacha-el-Adme, governor of Damascus for twenty-five years of the last century.

Mohammed and Mourad were the two sons of a rich merchant of Constantinople, who died when they had just arrived at manhood. The youths inherited considerable wealth, and, with his individual portion, Mourad continued the commercial business of the father, which prospered in his hands, to the great increase of his means. Mohammed, on the other hand, devoted his heritage to the pursuit of pleasure. He assembled round him a band of youths like himself, and plunged with them into follies and extravagances of every kind. The prodigious expenses consequent on such a way of life swallowed up the fortune of Mohammed in a single year, and then the prodigal youth found his associates drop from his side by degrees. Even his brother, under the plea of having forewarned him of ruin, closed his doors against Mohammed, and refused to see him. Although this was but the usual and natural course of things, the unfortunate young man was at first shocked and stupified by the treatment he met with; but, being of a buoyant disposition, he soon recovered from the lethargy into which he had been thrown, and nerved himself to bear his reverses with patience. He saw no way of sustaining himself but by accepting the alms of the mosques, and this accordingly he did for some time, always hoping that chance would turn up something better in his favour. And ere long, circumstances did occur, which led to a striking revolution in his condition.

On every Friday, at that time, the sultan went to perform his devotions at mid-day, in one of the chief mosques of Constantinople. He was accompanied by all his principal officers of state, dressed in their richest costumes, and by his side marched two officers, bearing bags of money, which it was customary for the sultan to scatter with his own hands among the people. The contents of these bags, nevertheless, were not wholly composed of money. Besides the ordinary gold and silver coins of the country, which were all folded up in pieces of paper, there were also small bits of glass wrapped up in the same way, but with this difference, that the envelopes of the bits of glass were one and all marked by short sentences in the sultan's own handwriting. These sentences were usually maxims in praise of poverty, or short sayings, in which riches were decried. It may readily be believed that the precious metal was much more coveted by the crowd that followed the sultan's heels than the moral bits of glass. One day after his reduction to poverty, Mohammed joined the needy train of attendants on the royal cavalcade. He eagerly watched the sultan's movements, saw his hand inserted into the bags, and, when the desired shower fell around, pounced on one of the folded bits of paper. Mohammed did not open his prize immediately, but allowed the crowd to pass on, and then looked at it. His mortification was unspeakable, when in place of gold he found only a rounded piece of glass. He was about to dash it on the stones at his feet, when the writing caught his eye. The words were, "*Artifice and address will often lead men to dignities.*" This maxim, by some accident, was most unlike those usually selected for the same purpose. Mohammed reflected long upon the words before his eye, and he then put the paper and glass carefully into his dress. This done, he moved away with a firm and determined step. He had conceived a project.

In Constantinople there are merchants who make a practice of hiring out all sorts of dresses, from that of a vizier, glittering with precious stones, to the modest robe of the dervise. Stores of this kind seem as if intended for no other purpose than to aid men to accommodate themselves to the rapid changes of fortune common to the land. Nor do these merchants confine their traffickings to garments. They will procure at an hour's notice, horses, domestics, guards, household offi-

cers, and every conceivable appendage of a great establishment, which they let out to be paid for by the week or month. To one of these dealers, Mohammed applied himself, and, having a noble figure and commanding air, he induced the merchant to furnish him on the instant with the richest dress of a pacha, with a beautiful horse, and with a suite of splendidly dressed domestics. One hour sufficed to transform the mendicant into a magnificent dignitary, who charmed all eyes by his gracious physiognomy, and the ease of his manners.

All these rich furnishings were to be paid for within a very brief period. Mohammed had no money, but he had an inventive genius. Attended by a portion of his suite, he directed his course to the house of his brother. Arrived there, he stopped his horse at the threshold, and dispatched one of his attendants to say to Mourad that his brother wished to see him. Mourad was about to give a harsh reply, when he chanced to get a glimpse of Mohammed and his train through the window. To his astonishment, every thing bespoke the presence of a great pacha. Mohammed sparkling with jewels, and Mohammed a beggar, were two very different beings, and Mourad made all possible haste to reach the threshold of his house. "Mourad," said Mohammed, saluting his brother without leaving his horse, "our lord the sultan has named me Pacha of Damascus. I have need of a large sum of money to establish me creditably in my government. Have this money ready for me by to-morrow. I will reimburse you as a brother and a pacha should do."

"May heaven prolong the days, and increase the glory, of our lord and master the sultan!" replied Mourad. "Mohammed, you were born to do honour to our family. My fortune belongs to you henceforth; take it all, if you desire. Pacha of Damascus, may Allah reward you according to your merit!"

Mohammed employed the night in completing his arrangements. He enrolled fifty men as a body-guard, and added a number of Tartar couriers to his suite. In the morning he sent his treasurer to his brother's house to request twenty thousand pieces of gold. On receiving this sum, Mohammed paid all that it was absolutely necessary at the moment to pay, and soon after he crossed the Bosphorus with his train, and took the way—whither, does the reader think!—to Damascus!

Mohammed was no common scheming swindler. The lofty confident bearing which he assumed, together with the frequency of such hasty elevations, had persuaded his train, as well as every one with whom he came in contact, of the reality of his appointment to the pachalik of Damascus. Mohammed, however, kept himself very quiet until he was fairly at a distance from Stamboul. As he approached the Damascene territory, he began to distribute presents in the towns through which he passed. He was every where received with the honours due to a pacha, and exchanged gifts with the various governors in his way, who, remembering the great power of the Damascene pacha, did not allow the new possessor of that title to be the losing party in these exchanges. When Mohammed came at length within three days' journey of Damascus, he ordered his party to stop and erect their tents. He then called his secretary, and dictated to him a letter addressed to the principal emirs of Damascus, in which it was announced to them that the sultan, having great cause to be displeased with his grand vizier at Constantinople, had disgraced and beheaded him, and that the son of the vizier, the pacha of Damascus, having shared in his father's guilt, was doomed to the same punishment. Mohammed wrote this letter in his own name, and concluded it by stating, that, being appointed the new pacha, he had come to fulfil the sultan's orders, and now commanded the emirs to seize the vizier's son, and detain him to await his fate.

Before dispatching this letter, however, Mohammed sent off a trusty and active courier with orders to introduce himself into the palace of the Pacha of Damascus, and there privately inform the vizier's son that his father was beheaded, and that he himself was about to undergo the same doom at the hands of a successor to the pachalik, then on his way to the city. The courier arrived before the bearer of the letter to the emirs, and such was the effect of his disclosures, that the poor pacha, believing death otherwise inevitable, and knowing himself to be very unpopular, left the palace in secret, mounted his fleetest horse, and was soon in full flight from Damascus, leaving treasures, wives, and all behind him. As for the emirs, as soon as they received the letter addressed to them, they met to deliberate upon the course to be adopted. While thus engaged, a second courier reached them, with missives of similar import. A third and fourth messenger followed from Mohammed, each new one bearing mandates more imperious than the preceding. At length, seriously alarmed for the consequences of refusal, the emirs gathered their followers, and roused the citizens to seize the old, and receive the new pacha. Having got the citizens together, the emirs proceeded with a great crowd to the palace, and, no one presenting any opposition, they soon penetrated to every corner of the vice-regal dwelling. But what was their consternation to find that the bird was flown—no pacha there!

The now excited crowd blamed the emirs for their dilatoriness, and riot and pillage would certainly have ensued, had not the sound of loud acclamations been heard at a little distance. In a minute or two, Mohammed appeared in the midst of his train, splendidly attired, and scattering gold on all sides among the people. The first words which Mohammed spoke when

he sprang from his horse in front of the palace were, "My prisoner! where is he?"

The emirs were alarmed at the firm, stern tone of the speaker. "May it please your excellency," said one of them, "he had doubtless received private news from Constantinople; for when we forced the palace, he was gone!" "Gone! Escaped!" cried Mohammed. "Unhappy emirs, know that my orders were the orders of the sultan himself, our master. You shall answer to me for the fugitive with your heads. Retire! You shall soon know the doom reserved for those who fail to execute the will of the sultan!"

This last menace filled the emirs with fear and consternation. Already had the new pacha conciliated the favour of the people by his liberality. Resistance to his authority seemed impossible. While thoughts of this nature oppressed the minds of the Damascene emirs, Mohammed sent for them one by one, and, laying aside his anger entirely, gave each a most gracious reception, dismissing them all with rich presents (from the late pacha's treasury), after consulting them on the condition and wants of the country. Their fears thus changed into joy, the emirs either did not think of asking, or did not dare to ask, the new pacha to go through the usual form of exhibiting his firman or commission from the sultan to the great nobles and office-bearers of the place. Glad to have their dilatoriness with respect to the late pacha overlooked, they would not risk a new offence. Meanwhile, Mohammed, who was really a man of powerful talents, and endowed with many good qualities, spent the commencement of his administration in relieving the burdens of the people, in reforming abuses, and in establishing new and wise rules for the protection of commerce and agriculture. Winning thus the esteem of the good, he perfected his popularity by giving splendid fêtes, and by a generous disbursement of his predecessor's funds. He behaved with the utmost liberality to the late pacha's family, and raised all the chief emirs to new dignities.

There was comparatively little intercourse in those days between Damascus and Constantinople, and a considerable time elapsed, partly through the care of Mohammed, ere any information respecting these extraordinary events reached the capital of the sultan. The pacha so strangely deposed was the person through whom the truth was at length made known. On leaving Damascus, the pacha had passed by weary stages across the desert, and finally arrived at Bagdad. At first he was obliged to subsist on the charity of the mosques, but afterwards hired himself as assistant to a pastry-cook, concealing his name and history through the fear of yet meeting the fate which he believed his father, the grand vizier, to have undergone at Constantinople. Familiar with sudden rises, the Turks are equally accustomed to rapid falls, and the poor pacha toiled away in peace and resignation for some months, never daring to let his father's name cross his lips, and avoiding all public society for fear of some chance recognition. At length a secret agent of the Ottoman government met the pastry-cook's assistant. "How, my lord!" cried the agent, "your excellency here, and thus! Surely—surely you are the pacha of Damascus?" "You are deceived, sir," was the reply, delivered with visible tremor; "I am a poor artisan, a pastry-cook of this city." "Oh, no!" said the other; "I recognise you perfectly. You are the son of my master, the grand vizier. What would your father say could he see you in this miserable disguise?" "In the name of Allah!" whispered the poor ex-pacha, "if you have been my father's friend, by his shade I conjure you to be silent, and not to betray me!" "Shade, do you say, my lord?" was the agent's answer; "your father is not dead. I had letters but yesterday from him."

This led to a full explanation, and the overjoyed son of the vizier gladly consented to go to the agent's dwelling, where he was clothed in garments worthy of his rank. After consulting together respecting the now obvious imposture which had deprived him of his government, the ex-pacha resolved to set out immediately with the agent for Constantinople, and there demand justice from the sultan himself. This journey was undertaken without delay. On their arrival at Constantinople, nothing could exceed the astonishment with which the old vizier listened to the recital of his son's misfortunes. The matter seemed utterly mysterious to the vizier, as it did also to the sultan, when his minister demanded an audience, and related the circumstances. Nevertheless, the sultan promised redress, and immediately dispatched a *capdji-bashi*, or officer, to Damascus, with orders to bring the usurping pacha to Constantinople. Four hundred guards accompanied the messenger of the sultan.

During the eight months that Mohammed had ruled in Damascus, he had made his administration a blessing to the inhabitants, who found in him a father rather than a pacha. When the officer of the sultan arrived, Mohammed kissed the imperial manasse, placed it on his brow in token of submission, and demanded only a few hours to prepare for the journey enjoined on him. In this interval he convoked the emirs, told them that the sultan had called him to Constantinople, and took an affecting farewell of them. Scarcely had he left the city with his guards, when the emirs took the resolution of addressing a petition to the sultan, to preserve Mohammed in the pachalik of Damascus. They sent this off, but as it did not appear strong enough to them on second consideration, they wrote another document, in which they detailed the benefits conferred on the pachalik by Mohammed, and declared firmly that they could not

receive any other governor. As if Mohammed's own example at his arrival had inspired them, the emirs sent yet other letters, in some of which they held out no very unintelligible threats of revolt.

Meanwhile, Mohammed pursued his journey to Constantinople, and was taken to the presence of the sultan.

"Who art thou, unhappy wretch?" cried the sultan. "One of your pachas," replied Mohammed, with respect but without fear.

"Who signed thy firman of investiture, thou miserable impostor?"

"Your highness," answered Mohammed firmly.

"This is too much!" cried the sultan; "show it, show it to me, if thou wouldst not die on the spot!"

"Behold it!" cried Mohammed, taking from his bosom the piece of paper that enveloped the bit of glass found in the street. The sultan took the scrap held out to him, examined the words, and recognised his own handwriting. He sat buried for some moments in reflection, while the vizier stood a little apart, hopeful of revenge, and Mohammed bent his knees, hopeful of pardon.

At this moment the first courier arrived from the emirs. Representing his missives as of the first importance, they were instantly delivered to the sultan. They saved the life of Mohammed, or at least decided the sultan's mind on that point. Ere long, courier after courier arrived, with letters to the same purport, and always increasing in urgency. The issue was, that the sultan addressed these words to the vizier and Mohammed, both standing before him:—

"Vizier! I cannot inflict any punishment on this man without endangering the tranquillity of the empire. I will give your son another pachalik. Mohammed, I restore you to your government; but remember, that if it is by artifice you have raised yourself to the rank of a pacha, it is because you have shown great abilities and a good disposition that I ratify your title and grant your pardon. It is well that so bad a maxim has not fallen into worse hands. Retire."

Mohammed ruled wisely and happily in Damascus for twenty-five years.*

POPULAR INFORMATION ON SCIENCE.

ON THE ELECTRICITY OF ANIMALS; ESPECIALLY THAT CALLED ANIMAL ELECTRICITY.

THIRD ARTICLE.

It is generally known that the electric faculty naturally exhibits itself under two forms—that of mere tremor, and that of a shock; and it is interesting to know, that the former of these, as well as the latter, can be imitated by artificial electricity, and is thus demonstrated to be only a different modification of the same power. Thus, on one occasion, we find Mr Walsh stating—"The torpedo, in this instance, dispensed only the distinct instantaneous stroke so well known by the name of the electric shock; that protracted and lighter sensation, that torpor or numbness which he at other times induces, was not then experienced, but it was imitated with artificial electricity, and shown to be producible by a quick succession of minute shocks. This may perhaps be effected by the successive discharge of his numerous cylinders, in the nature of a running fire of musketry: the stronger single shock may be his general volley."† The reversed experiment, again, was made by Dr Ingenhousz: "After the nets were taken up, I charged a Leyden jar, and gave a shock to some of the sailors, who all told me they felt the same sensation as when they touched the torpedo." We have seen, on the testimony of Humboldt, the extreme exhaustion which is sometimes induced in these animals by the violent and repeated exertion of their power; and probably it may be laid down as a principle, that the more violent the individual shocks, the more speedy and complete the exhaustion. At the same time, it is quite astonishing to what extent the power can sometimes be manifested. Thus, Mr Walsh, after having isolated a torpedo, so that it could not receive electricity from surrounding objects, mentions that he took no less than fifty shocks from it in a minute and a half. And again he states, that a large torpedo, very liberal of his shocks, taken from the Bay of Biscay, being held with both hands by his electric organs above and beneath, was briskly plunged into water to the depth of a foot, and instantly raised an equal height into air; and was thus constantly plunged and raised, as quickly as possible, for the space of a minute. During every repetition of this process, he gave five, and sometimes six shocks; a violent one when he touched the water in descent, a still more violent one on leaving

it; he, moreover, always gave two when wholly in air, and generally two, though sometimes only one, when wholly in water; whence the number of shocks during the minute could not be under one hundred! In the above relation, Mr Walsh informs us that the animal was a large one, and therefore could not be very young; which observation is not in accordance with that of Dr Davy, more recently made at Malta, "that the electric power of the young fish is proportionally very much greater than that of the old, and can be exerted without exhaustion and loss of life much more frequently. After a very few shocks, most of the old fish have become languid, and have died in a few hours; while young ones have remained active for ten or fifteen days."

Baron Humboldt expressly states, confirming herein the observation of Mr Walsh and others, that he and Gay Lussac found, on examining the torpedo at Naples, "that the shock may be felt when a single finger is applied to a single surface of the electric organ." Dr Davy, on the other hand, informs us that the experiments which he made expressly on the point, led to the conclusion that "one must touch the opposite aides before he receives a shock."

The frequent examination of these fishes has abundantly proved that their peculiar faculty is in a very essential manner dependent upon the connection of the electric organ with the brain and spinal cord. Humboldt mentions that when the gymnote was cut asunder, the anterior part only continued to give shocks. According to Mr Todd, who examined the torpedo at the Cape of Good Hope, it is necessary to cut through all the nerves before the power is destroyed; and he adds, that the individuals in which all the nerves had been cut, appeared more lively after the operation than before it, and actually lived longer than others not so treated, but which were frequently excited to discharge. Dr Davy noticed the same fact.

But the great point to which the energies of men of science have hitherto been principally directed regarding the very peculiar faculty of these animals, has been the ascertaining whether it be identical with common electricity, as brought under review by the natural philosopher. The idea was first, we believe, suggested by the eminent Dutchman Muschenbroek; and the celebrated Adanson, as far back as 1756, threw out the same idea regarding the *Silurus* of Senegal. But it is not above seventy years since, in the days of Franklin, this explanation was attempted to be experimentally proved by Mr Walsh, an English gentleman, a member of parliament, and a Fellow of the Royal Society; and it is only in the present day it can be said to be definitely and satisfactorily settled. Mr Walsh, at the time in France, had his curiosity attracted to these fishes, which were then unknown in England, and devoted himself with great energy to the investigation of their properties. He was instantly struck with the strong analogies which subsist between this animal power and electricity, and, after extended and ingenious experiments, concluded they were the same. He transmitted the result of his observations to Dr Franklin, then in England, for the purpose of being communicated to the Royal Society, and the public. His correspondence with that great man is highly interesting. "It is with peculiar interest," he remarks, "I make to you my first communication, that the effect of the torpedo appears to be absolutely electrical;" and he adds, after going over the details, "He who predicted and showed that electricity wings the formidable bolt of the atmosphere, will hear with attention that in the deep it speeds a humbler bolt, silent and invisible; he who analysed the electric phial, will hear with pleasure that its laws prevail in animated phials; he who by reason became an electrician, will hear with reverence of an instinctive electrician gifted at birth with a wonderful apparatus, and with skill to use it." Some idea may be formed of the general interest which was at this time felt in the discovery, when we mention that Mr Walsh exhibited the phenomena not only before the *Academy* at Rochelle, but also before numerous assemblies of the principal inhabitants of the city; and in the French Gazette of the day there was a communication from the mayor of Rochelle, expressly detailing the leading facts and circumstances.

It is somewhat singular, that, when this examination of the torpedo was going on in the old world, similar investigations were taking place in the other hemisphere with respect to the gymnotus. These were made in Philadelphia and Charleston, then in the British possessions, by Drs Williamson and Garden. At this time the gymnote had never been accurately examined. The same conclusions were reached, grounded on the same data. The extensive series of experiments we

* Translated, for this publication, from one of the numerous *feuilletons* now appearing in the French newspapers. It is to be hoped that the reader, like the sultan, will be disposed to overlook Mohammed's delinquencies, not exactly for the sake of what was redeeming about them—for that was but little—but on account of the extremely whimsical nature of the adventure.

† Philosophical Transactions, 1773, 468.

* Phil. Trans. 1838, 377.

† The same, 1834, 467.

must again, for brevity's sake, omit, and sum up the conclusions in the following words:—"As the fluid discharged by the eel affects the same parts that are affected by the electric fluid; as it excites sensations perfectly similar; as it kills and stuns animals in the same manner; as it is conveyed by the same bodies which convey the electric fluid, and refuses to be conveyed by others that refuse to convey the electric fluid, it must also be the electric fluid, and the shock given by the eel must be the electric shock."*

Though these early experiments led to a strong presumption that this peculiar animal power was precisely of the same nature with common electricity, yet they were very far from reaching all that positive and absolute demonstration which alone satisfies the requirements of modern science; and hence naturalists have ever been on the watch to improve every opportunity which could supply additional satisfaction. The subject of electricity in general, likewise, has, within the period before us, been prosecuted with the greatest assiduity and success, and the phenomena of the respective subjects have mutually thrown light upon each other. Regarding artificial electricity, there are now a number of palpable effects which are considered as demonstrative of its presence and operation, of which we shall name the electric spark, heat, conferring magnetic virtue, and the exertion of chemical agency. These positive proofs of the operation of electricity were soon desiderated in connection with the animals we are considering, and one after another, by the ingenuity of experimenters, have been at last obtained. We shall allude shortly to these results.

Neither Walsh, nor Garden, nor any of the elder observers, though they sought it anxiously, succeeded in obtaining the electric spark from the torpedo. And more lately Sir H. Davy, with all his ingenuity, and Dr Davy, with all his advantages, were not more fortunate. Other experimentalists have, however, been more successful, and have observed the spark—most of them, indeed, not in the act of issuing from the body of the fish, but as the agent was making its way along the circuit to which, by artificial means, they had subjected it. Thus, Gardini saw the spark from the torpedo while repeating some of Mr Walsh's experiments in the year 1792; and in 1797, the celebrated Galvani obtained a small spark under the same circumstances. With regard to the gymnote, the phenomenon has been more decidedly marked, though in this case it is also true, that, while witnessed by some, it has never been observed by others. The first American observers could not by any arrangements detect the spark. So was it with Humboldt; he watched during the night, and irritated the gymnotus to its briskest discharges in vain. The experience of others, however, has been different. Mr Walsh having attached a thin sheet of pewter to a plate of glass, cut a fine slit in it, and then passed the discharge along the metallic sheet. A spark was, by this arrangement, very distinctly seen at the margins of the slit; and other respectable naturalists, by employing the same means, have been equally successful. Within these few months, we perceive that Dr Faraday has succeeded in procuring a spark from the gymnotus now in the London Adelaide Gallery of Science; but whether directly or indirectly, has not appeared. With regard to the *generation of heat*, although all previous experimenters, we believe, had failed, Dr Davy succeeded in demonstrating this effect, by using the electrometer invented by Mr Harris. Again, the power of electricity in *conferring a magnetic virtue* upon iron is one of its lately discovered most striking and unequivocal effects; and though many experimenters, and among others Sir H. Davy, failed, yet Dr Davy has procured these effects from the torpedo's discharge. By a single discharge of a torpedo only six inches long, he converted eight needles into magnets; and by a single discharge of a larger *tremola*, he magnetised four minute bars of steel, and two small sewing needles, one of which supported three times its weight of iron.† And with regard to *chemical effects*, Dr Davy has also been more successful than other observers. By means of gold and platina wires, which were applied to the fish, he passed the discharge through a variety of solutions, and thus decomposed them, precisely as would have been done had he employed electricity procured by the ordinary artificial means. All these successful results have still more recently been confirmed. Passing by the observations of Messrs Bequerel and Brechet, two distinguished French physiologists, who satisfied themselves "that the shock of the torpedo is the result of an electric discharge," Dr Faraday stated to the Royal Society in December last, that he procured from the gymnotus "not only the results obtained by others, but also those which were yet required, so as to leave no gap or deficiency in identifying the effects—the shock was procured, the meter affected, magnets were made, a wire was heated, chemical decomposition was effected, and the spark obtained."‡ It is added, that, by comparative experiments made with the animal, and a powerful Leyden battery, it was concluded that the quantity of force in each shock was very great: and it was also ascertained (a circumstance, we believe, not previously detected) that the current of the electricity was from the anterior part of the animal, through the water to the posterior, in every case. Striking as the result of these laborious investigations has been, its attainment has only led the way to speculations still more interesting. The question of

these fish producing electricity being settled, the inquiry as to the mode in which it is effected immediately presents itself; and perhaps in the whole compass of modern physiology, there is not one on which more intense interest is felt. We have seen that all these animals are provided with a curious apparatus, most abundantly supplied with nerves. What share, then, have these different parts in the production of the phenomenon? Does the organ actually secrete the electric fluid, or is it only the reservoir in which it is retained? That the nervous system has great influence, is most evident; but whether it acts merely as a stimulus to the organs, exciting them to produce that which their organic structure renders them capable of doing, namely, evolving electricity; or whether it actually supplies them with the stream of the active agent they accumulate, remains to be determined. It is quite possible the electricity may be elaborated in the organ; and the analogy of many glandular parts of the frame would lead to this, we are disposed to consider, the more probable conclusion; but it is also possible that the electricity is first developed in the brain and spinal marrow, is thence transmitted to the retaining organs, and is thus identical with common nervous power, or *nervism*, as it is called. The determination of this question would greatly extend our acquaintance with the nervous system throughout the animal series; and some philosophers seem now disposed to conceive that it may one day be proved that animal electricity is the very same agent that, at will, causes the motions of our limbs, and many other nervous phenomena. Such are the anticipations among others of the late Sir H. Davy. Treviranus, again, in 1818, remarked, "Perhaps it is the same power which enables the torpedo to give electric shocks, that is the immediate cause of muscular contraction." Dr Faraday states, "That from the time it was shown that electricity could perform the functions of the nervous influence, he has had no doubt of their very close relation, probably as effects of one common cause;" and Sir J. Herschel imagines "That the present state of electric science warrants the conjecture that the brain and spinal marrow form an electric organ, which is spontaneously discharged along the nerves at brief intervals." What a wondrous contemplation does such a relation between electricity and muscular action in particular, and nervous influence generally, present to the mind! Think of the racer's speed—the eagle's flight—or, to come to our own frame, think of the great centre of the circulating system, which, from life's first throbs, performs its vital function, and gives its 100,000 beats a-day, its 365,000,000 a-year, without agitation, without notice, till the three score and ten years have fulfilled their course—think of the touch, quick as thought, of the inspired musician—of the fervid tongue of the excited orator, pouring forth "thoughts that breathe and words that burn," and this associated with the agent now under consideration! Surely there is here "something to be thought upon." "Late discoveries," says Dr W. Philip, "have been gradually evincing how far more extensive than was supposed, even a few years ago, is the dominion of electricity. The nervous system, the leading power in the vital functions of the animal frame properly so called, appears to be a modification of this apparently universal agent; for I may add, we have already some glimpses of its still more extensive dominion."§ That there is here a most interesting field opened up for speculation, is evident, on which our limits, were there no other cause, forbid us to expatiate. We shall therefore conclude, as expressing our own sentiments, in the sapient words of a very valuable recent work, "That the power which causes muscular contraction is the same which enables the electrical fishes to give sensible manifestations of electricity, cannot, after the facts now enumerated, be deemed an improbable supposition. Still, however, no proof can be derived from this source of the identity of nervous influence with any form of electricity; since all that can be stated is, that by the influence of the nervous system on one organ, electricity is generated—and that by its action on another, sensible contraction is produced. The property of generating electricity may be as much peculiar to the special organs which we find for accumulating it, as that of contractility to muscular fibre; and its manifestation may, after all, be dependent upon some molecular changes excited by the influence of the nerves, to which the evolution of electricity may be due."¶

But it is now time to draw to a close. The use of this power to the animals which possess it, is evident, and probably various. As a defence against its foes, it must be most efficient. Those fishes which can stun men and horses will be carefully avoided by the most powerful fishes. Again, this faculty must be useful in procuring food. Dr Williamson tells us that the gymnote deliberately swims up to a fish, for a moment looks at it, strikes it with its thunder, and then devours it. Dr Davy, from his observations, has suggested that it probably strengthens the powers of the stomach, and promotes digestion, and is also useful in effecting the necessary changes which the blood undergoes in sustaining life.

As to the *uses* to which these fishes may be converted by man, they are first an article of food. The gymnoti of Surinam, Dr Garden tells us, "are by some people esteemed a great delicacy." This is not quite the case with the torpedo. Dr Davy states that at Malta it is

not much sought after for the table, and is used only by the indigent. Though both Hippocrates and Galen, weighty authorities, give their sanction to its use, its sale, according to Rondelet, is forbidden in the market of Venice; whilst, according to Walsh, it is considered wholesome food, and sold freely, in France. By the ancient physicians it was used in medicine. In the time of Dioscorides, the physician of Anthony and Cleopatra, the shock of the torpedo was recommended especially for the cure of obstinate headaches; and this may be considered the earliest application of electricity to physic. Anthony, a freedman of Tiberius, is said to have been cured of the gout by it; and in later times it has been used for this luxurious complaint. In the present day, the Arabians employ its shock, especially in fevers. It may safely, however, be asserted, that the healing art among ourselves does not lose much by omitting animal electricity from among the articles of its *materia medica*.

ANECDOTE OF M. ALEXANDRE, THE VENTRILOQUIST.

We need scarcely remind the public that M. Alexandre, the famous ventriloquist, who exhibited before them only a few years ago, had an extraordinary facility in counterfeiting all the expressions of countenance and bodily conditions common to humanity. When in London, his mimetic powers, which he was fond of exercising both in public and in private, made his company in high request among the upper circles. The Lord Mayor of the city, in particular, received the ventriloquist with great distinction, and invited him several times to dine at the Mansion-House. But it unluckily happened that, on every occasion when M. Alexandre dined there, he could not stay to spend the evening, having contracted engagements elsewhere. The Lord Mayor expressed much regret at this, and the ventriloquist himself was annoyed on the same account, being willing to do his best to entertain the guests whom the Lord Mayor had asked each time to meet him.

At last, on meeting M. Alexandre one day, the Lord Mayor engaged him to dine at the Mansion-House on a remote day. "I fix it purposely," said his lordship, "at so distant a period, because I wish to make sure this time of your remaining with us through the evening." Through fear of seeming purposely to slight his lordship, M. Alexandre did not dare to tell the Mayor that on that very morning he had accepted an invitation from a nobleman of high rank to spend at his house the evening of the identical day so unfortunately pitched on by the civic dignitary. All that the ventriloquist said in reply was, "I promise, my lord, to remain at the Mansion-House till you yourself think it time for me to take my leave." "Ah, well!" said the Lord Mayor, and went off perfectly satisfied.

At the appointed day Alexandre sat him down at the magistrate's board. Never had the ventriloquist comported himself with so much spirit and gaiety. He insisted upon devoting bumpers to each and every lady present. The toasts went round, the old port flowed like water, and the artist in particular seemed in danger of losing his reason under its potent influence. When others stopped, he stopped not, but continued filling and emptying incessantly. By and bye his eyes began to stare, his visage became purple, his tongue grew confused, his whole body seemed to steam of wine, and finally he sank from his chair in a state of maudlin, helpless insensibility.

Regretting the condition of his guest, the Lord Mayor got him quietly lifted, and conveyed to his own carriage, giving orders for him to be taken home to his lodgings. As soon as M. Alexandre was deposited there, he became a very different being. It was now ten o'clock, and but half an hour was left to him to prepare for his appointed visit to the Duke of —'s soirée. The ventriloquist disrobed himself, taking first from his breast a quantity of sponge which he had placed beneath his waistcoat, and into the pores of which he had with a quick and dexterous hand poured the greater portion of the wine which he had apparently swallowed. Having washed from his person all tokens of his simulated intoxication, and dressed himself anew, M. Alexandre then betook himself to the mansion of the nobleman to whom he had engaged himself.

On the following day the fashionable newspapers gave a detailed account of the grand party at his Grace the Duke of —'s, and eulogised to the skies the entertaining performances of M. Alexandre, who, they said, had surpassed himself on this occasion. Some days afterwards, the Lord Mayor encountered Alexandre. "Ah, how are you?" said his lordship. "Very well, my lord," was the reply. "Our newspapers are pretty pieces of veracity," said his lordship; "have you seen the Courier of the other day? Why, it makes you out to have exhibited in great style last Thursday night at his Grace of —'s!" "It has but told the truth," said the mime. "What! Impossible!" cried the Mayor; "you do not remember, then, the state into which you unfortunately got at the Mansion-House?" And thereupon the worthy magistrate detailed to the ventriloquist the circumstances of his intoxication, and the care that had been taken with him, with other points of the case. M. Alexandre heard his lordship to an end, and then confessed the stratagem which he had played off, and the cause of it. "I had promised," said Alexandre, "to be with his grace at half past ten. I had also promised not to leave you till yourself considered it fit time. I kept my word in both cases; you know the way." The civic functionary laughed heartily, and on the following evening Alexandre made up for his trick by making the Mansion-House ring with laughter till daylight.

Many anecdotes are told respecting M. Alexandre's power of assuming the faces of other people. At Abbot'sford, during a visit there, he actually sat to a sculptor five times, in the character of a noted clergyman, with

* Phil. Trans. 1775, 101.

whose real features the sculptor was well acquainted. When the sittings were closed, and the bust modelled, the mimic cast off his wig and assumed dress, and appeared with his own natural countenance, to the terror, almost, of the sculptor, and to the great amusement of Sir Walter and others who had been in the secret.

SNATCHES OF CONTINENTAL RECOLLECTIONS.

THE DUTCH HERRING FISHERY.

THE Dutch greatly excel in the art of curing herrings. The herring in a salted state is the animal delicacy of Holland, and enjoys a very different estimation from that of the common salt herring in Britain. Yet the fish of both countries are the same, being caught in the same fishing-grounds; and there is no reason why our herrings should be in any respect inferior in quality and mercantile value.

There are about eighty vessels employed in the Dutch herring fishery, nearly all of which belong to Vlaardingen and Maas-luis, two ports on the Maas, situated between Rotterdam and the sea. The fishing is conducted on an organised plan. All the vessels set sail on a fixed day, namely, the 15th of June, which is held as a day of rejoicing and merriment. They are accompanied by a vessel of war, which carries a chaplain for the fleet; and to this vessel, at the beat of drum, the fishermen proceed on Sundays for public worship. The fishing-grounds are towards the northern coasts of Scotland; but agreeably to a law of old standing, no vessel is expected to approach within three leagues of the shore. The first day that nets are allowed to be hauled is the 24th of June, when the fishing at once commences in all its vigour. The whole process of curing is conducted on shipboard. Immediately on being caught, the herrings are bled, gutted, cleaned, salted, and barrelled. The bleeding is effected by cutting them across the back of the neck, and then hanging them up for a few seconds by the tail. By being thus relieved of the blood, the fish retain a certain sweetness of flavour or delicacy of flesh which unbled herrings cannot possibly possess. The rapidity of the process of curing must likewise aid in preserving the native delicacy of the animal, for the herring is salted and in the barrel in a very few minutes after it has been swimming in the water. The superiority of the Dutch herrings, I was assured, is solely ascribable to this mode of curing, though it is not unlikely that something is also owing to the nature of the salt employed, as I have somewhere seen it mentioned that the salt in use, in reference to other processes of curing in Holland, is of a less bitter quality than that which is commonly employed in this country.

The first herrings caught and cured, to the extent of two or three barrels, are instantly dispatched by a fast-sailing vessel for Holland, where their arrival is anxiously expected. On landing at Maas-luis, one barrel, decorated with flowers and with flags flying, is dispatched to the Hague as an offering to his majesty, who on this occasion presents the fortunate fishers with 1000 guilders. The other barrels are sold by public auction, and generally fetch from 900 to 1100 guilders. These precious barrels are then subdivided among the dealers, who retail them at a high price. A single herring of this first importation brings one and a half to two guilders—that is, half a crown to three shillings and fourpence each. So highly are they esteemed, that a single herring is considered a handsome present; and it is a custom to make such gifts to friends and acquaintances on this auspicious occasion. Livery servants may be seen passing through the streets with a plate, on which lie one or two herrings, covered with a fine white cloth and a neat card of presentation. When a second importation takes place, the price falls perhaps to a guilder, to half a guilder, to fivepence, and, finally, to a penny each. The period of my visit was shortly after the early importations of the herrings from the Dutch fleet, and I observed some shops still decorated with the gaudy crowns of flowers with which their exterior had been invested a few weeks before. Both in Holland and in the countries up the Rhine, I had an opportunity of seeing these delicious Dutch herrings brought to table. Two or three of them form a dish at dinner, and are partaken of as an entremet, or something tasteful between the courses. I observed that some persons at the table-d'hôtes began their meals by taking a small piece of them. They are always brought to the table raw, and cut across, as if crimped. At Rotterdam, on asking for one boiled, I shocked the feelings of our domestic attendant, who expressed no small degree of surprise at so singular a proposition.

PRIDE MORTIFIED.

At a ball given in Pymont, a celebrated watering-place in Germany, the tutor of a young count, a Göttingen student, requested a young lady to dance with him. Just as the dance was about to commence, the lady inquired of him, "With whom have I the honour of dancing?" "I am the tutor of Count Von Z—," replied her partner. "And a commoner, I presume," she rejoined; to which he answered in the affirmative. "Oh, then," continued the lady, as she withdrew her hand from that of the tutor, "I beg you will excuse me, for mamma has forbidden me to dance with a commoner." This rebuff completely threw the modest preceptor out of countenance, for on the continent to be so deserted on the eve of a dance, is to lose caste for the rest of the night, if not longer. It is supposed to indicate the existence of some moral taint discovered by the person who quits the side

of another, and which is exaggerated into something heinous by the company, particularly if they are utterly ignorant of what it is. The young man quitted the room, and sought the open air to breathe more freely and collect himself. His pupil followed him, and learned the cause of his distress. "You shall soon have ample satisfaction for this mortification," said the generous count, and hastened back to the ball-room, followed by his tutor. The moment was propitious. Preparations were going forward for another waltz; the young count requested the rejector of his tutor to be his partner in the dance, and she eagerly accepted the proposal, no doubt greatly rejoicing at the immense stride which she had taken from ranking with the humble tutor, to pairing off with the wealthy noble. Just before the dance began, he addressed to her the question which she herself had put, "With whom have I the honour of dancing?" "With the Lady Von B—," she replied. "Oh, I beg your pardon," said the count, "but papa has forbidden me to dance with any but countesses," and instantly quitted her side. He had the satisfaction of hearing that his conduct was applauded by every sensible person in the room. Few will deny that it was a well-merited punishment.

BIOGRAPHIC SKETCHES.

HENRY THE NAVIGATOR.

HENRY THE NAVIGATOR was a younger son of John I. of Portugal, and was born in the year 1394. Portugal had got rid, shortly before this period, of its Moorish conquerors, and John, who was a vigorous and enlightened prince, pursued his advantage over the usurping race, by following them to their own settlements on the coasts of Africa. In the year 1415, accompanied by his numerous sons, and the flower of his nobility, he passed over to the African continent, and laid siege to the city of Ceuta, in the kingdom of Fez. He succeeded in taking Ceuta from the Moors, and appointed Don Henry to the governorship of the conquered city and the district around it, as a reward for the valour and ability he had displayed during the struggle. Henry was at this time in the spring of manhood, and was distinguished by his scholarship, and by his taste for geography, astronomy, mathematics, and other practically useful sciences. These qualities, doubtless, were instrumental in instigating him to the projection of maritime enterprises and schemes of geographical discovery. But there were other motives, also, likely to operate strongly on his mind. Seeing Henry to be decidedly the most able and active of the family, his father had appointed him Grand Master of the Order of Knights of Christ, instituted at the abolition of the Order of the Temple. The appointed duties of the new order of knights were, to do battle with the infidels and spread the true religion; and Don Henry's peculiar tastes probably suggested to him that the fulfilment of his functions as knight and grand master might be made subservient to the furtherance of the commerce of his country, and the extension of geographical knowledge.

With such motives operating on his mind, Don Henry, not being obliged to stay in Ceuta, took up his residence in the city of Sagres, situated close by Cape St Vincent in Algarve, and there he drew around him skilful mariners and learned men from all quarters of the continent, with whom he discussed the best mode of carrying out the views he entertained. These views had reference chiefly to the immense continent of Africa, concerning which the prince had picked up much information during his expedition to Fez. He had perfectly satisfied his own mind that the southernmost point of that continent might be doubled by mariners, and a new route thus opened up to India, and to all the other wealthy countries of the East, whose productions had been so long brought to Europe only by tedious and overland journeys, or by the Red Sea, where the hostile Mahomedans monopolised all the advantages of the traffic. Splendid, however, as were the prospects connected with such a discovery, the attempt to realise them was an affair, obviously, of great doubt and danger. The coast of Africa was at this time altogether unknown beyond Cape Nun; and as those who had gone southward either by land or sea had always felt an increasing degree of heat, the impression was commonly entertained that a region of fire lay in that direction, unendurable by human beings. It required no ordinary degree of patience and perseverance in Don Henry to convince his friends of the falsity of such impressions. By means of the school and observatory which he erected at Sagres, nevertheless, he succeeded in training to his purpose a number of the young nobles of Portugal, and in infusing into their minds a portion of the spirit which animated himself.

The first voyage undertaken by orders of Don Henry, and, in fact, the first voyage of discovery made

by the Portuguese nation, was one which took place in 1412, three years before the siege of Ceuta. The vessel sent on this occasion barely passed Cape Nun, and returned without having effected any useful purpose. After Henry had been for a year or two at Sagres, new expeditions to the same quarter were set on foot by him, but with so little success on several occasions, that the people began to complain of the waste of men and money occasioned by the prince's mania for discovery. The chief cause of the failure in these instances was the imperfect state of navigation at the period, as well as the total ignorance of the mariners respecting their route. These causes made them sail always so close to the coast they were exploring, as to involve them in repeated calamities on the occurrence of storms. Don Henry himself grew saddened at the obstacles which arose to thwart his favourite schemes, although his belief in their ultimate practicability was never diminished. Seeing his anxiety of mind upon this subject, two young nobles of his household, John Gomez Zarco and Tristan Vaz Texeira, who had been his scholars in the art of navigation, offered their services in a new expedition to explore the African coasts. The prince readily fitted out a stout bark for the purpose, and the adventurers left Sagres. They had arrived at the shores of Morocco, and were coursing along them, when a violent gale sprang up from the land side, and drove them out to sea. The Atlantic being then a vast unknown blank on the map of the world, the adventurers considered themselves as lost; but when the storm abated, they saw an island at a little distance from them. On this they landed, and gave it the name of *Puerto Santo*, in commemoration of their escape. This island is said to have been inhabited at the time of this discovery, but the climate appeared so delightful, and the soil so fertile, that the voyagers resolved to propose the planting of a colony upon it. By the aid of the compass, which instrument Don Henry himself had greatly improved for the purposes of navigation, Zarco and Texeira readily found their way back to Portugal.*

This voyage took place in 1418, and the description of *Puerto Santo*, given by the voyagers, was so gratifying to Don Henry, that, by the aid of the king, a new expedition was fitted out for colonising the island, and prosecuting discoveries in the same region. Three ships, commanded respectively by Zarco, Texeira, and Bartholomew Perestrelo, sailed for *Puerto Santo*, with seeds on board, as well as various animals and implements fitted for the use of settlers. Among the animals in question were a pair or two of rabbits, which were allowed to run loose upon the island, and multiplied so surprisingly in the course of two years, as to destroy all the vegetation, and banish the colonists from the shores. Long before this happened, however, a more important scene of colonisation had been discovered. Zarco and Texeira, after going out with their ships, remained for some time at *Puerto Santo*, and having observed something like a dark spot, always fixed at a certain point of the horizon, they sailed for it one day, and discovered the island of Madeira. This isle was covered with woods, and totally uninhabited; though it is believed that our Portuguese adventurers were not the first Europeans who had landed on it. A pair of unfortunate English lovers, flying from the cruelty of their relatives, had been driven in their bark to the shores of Madeira, where they died. The story of these lovers is told at length, in the shape of a partly fictitious narrative, in one of the earlier numbers of this Journal.

Zarco and Texeira, delighted with this new discovery, hastened back to Portugal, where they gave information of what they had seen. In spite of new fears and opposition on the part of the Portuguese nation, who now declared that the parent country was in a fair way to be depopulated by these schemes, Don Henry sent out a new colony to Madeira, foreseeing that its climate would render the island a fit nursery for the vine and sugar-cane to the Portuguese people. From Sicily, where sugar had been partially raised for some time, he procured the necessary seeds, and sent them out along with vegetables of other kinds. His views have not proved fallacious, for up to this hour the colony, which soon became a thriving one, has ever proved a productive settlement for Portugal.

In addition to the annexation of *Puerto Santo* and Madeira to the crown of Portugal, Don Henry about the same time acquired the sovereignty of the Canaries. These isles had been first discovered by an English

* It is not uncommon for writers to describe Don Henry as the first person who applied the compass to navigation. But the use of the instrument by seamen is mentioned by writers of the twelfth century, and in the thirteenth century it was universally employed by the Spanish navigators. Don Henry is said to have also improved the astrolabe.

ship driven accidentally from her course. This discovery led a band of adventurers, composed of Frenchmen and Spaniards, to sail from Spain with five ships for the Canaries, which, about the year 1396, they plundered and partly took possession of. The Canaries were well populated at this period, containing, it is supposed, between twenty and thirty thousand inhabitants. John de Bethancourt, a Norman baron, became the ostensible lord of these isles; but, about the year 1420, his descendants sold their rights to Don Henry. These were valuable acquisitions in all to the crown of his ancestors, but the Navigator had still his heart bent on the far more splendid achievement of discovering a route to India by the south of Africa. So obstinate, however, was the prejudice arising from the numerous failures in this attempt, that it was long ere the prince could get a fitting person to undertake the adventure anew. At length, in the year 1433, a mariner named Gilianez set sail at Henry's instigation for the African coasts. This voyage was a most important one, at least in its ultimate results. Seamen had hitherto superstitiously believed Cape Bojador's precipitous line of rocks to be a barrier placed by heaven in the way of all farther advances to the south. Gilianez passed the fated point, and found the seas to be navigable, and the shores rich beyond it. The expedition was thus of great utility in dispelling silly prejudices, but it was not unproductive, also, of more solid benefits. Don Henry, for his important services in bringing new lands under the dominion of the Cross, had received a grant from the Pope of all lands discovered, or to be discovered, between Bojador and the East Indies. This gift, it was held, the Pope had a right to make, and, in fact, the validity of the grant was not disputed by other countries. Such being the benefits flowing from these discoveries, a new expedition was fitted out, after the return of Gilianez, for the further prosecution of the task of exploration. Antonio Gonzalez and Nuno Tristan were the leaders on this occasion, and they penetrated to the southward as far as Cape Blanco. Some Moorish captives were brought home from this voyage, and from them large offers of ransom were made, on condition of their being taken back to their native country. Gonzalez was sent by Don Henry with this view, and, in reality, considerable quantities of gold dust, and numbers of negro slaves, were given as the redemption money of the prisoners. On this voyage Gonzalez is understood to have seen the island of Arguin and the Cape de Verd Isles.

When the gold dust was once seen by the Portuguese, Henry had no further doubts and difficulties in the way of his schemes of discovery. Not only the Portuguese, indeed, but Venetian mariners, and enterprising men from all European countries, flocked to Sagres to join in the prince's expeditions. In the year 1444, two large parties of navigators set sail for the African coast, one consisting of six vessels for commercial purposes, and the other of two ships of discovery, commanded by Vicente de Lagos, and the famous Venetian mariner, Cada Mosto, the latter of whom wrote the first distinct account of the Canaries, Madeira, and the African coasts. Negro countries and manners were at this time perfectly new to the European world, all the parts of Africa hitherto examined being possessed by a totally different race, the Moors. Cada Mosto's descriptions apply in every point at this hour. He doubled Cape Verd before he turned homewards. On his voyage he heard of a great internal water (the Niger), and a large city named Tombuctoo, the site of a flourishing trade.

Don Henry the Navigator had now the pleasure of seeing the Canaries, Madeira, and the Cape Verd Islands, all colonised by his countrymen, and a thriving and lucrative traffic begun through these settlements with the coasts of Africa, over an extent of three hundred leagues, all unknown before his time. He indeed gave up his right over the Canaries to the court of Castile, but in 1448 Gonzalez Vallo discovered the Azores to counterbalance the loss. Nor was the good resulting from this great prince's spirit of enterprise confined to his country, or bounded by the limits mentioned. He had struck the spark, and the flame soon spread over the world. Henry died in 1461, at the ripe age of sixty-seven. Within a few succeeding years, the Guinea coast was added to the Portuguese discoveries; in 1484, the Congo was reached by Diego Cam; in 1487, the Cape of Good Hope was doubled by Bartholomew Diaz; and, in 1498, Vasco de Gama touched the shores of Hindoostan. Thus it is apparent that the progress of discovery, once fairly originated by Don Henry, was immensely rapid afterwards. But the discovery of America, also, had in the meantime taken place, and the enterprise to which it was owing may be fairly set down as but one of the immediate consequences of Henry's enlightened perseverance. Being prevented by the Pope's assignment from coping with the Portuguese on the African shores, the Spanish government, burning with anxiety to emulate the late proceedings of their neighbours, listened eagerly to the speculations of Columbus regarding a route to India across the Atlantic, and sent him off on the mission. On the 12th October 1492, Columbus landed in the West Indies.

All the brilliant consequences, not only to Portugal and Spain, but to the whole human race, which ensued from the passage of the Cape and the crossing of the Atlantic, are too well known to require recapitulation. Though, as in the case of all natural truths, these discoveries would most certainly have been effected

through the agency of other men, as circumstances became ripe for the denouement, yet there is high praise due to the individual who did really step forward from among his compeers, and set in operation the powers which led to accessions of knowledge so great and beneficial. On such grounds may a prominent niche in the temple of fame be claimed for Don Henry of Portugal, or to use his more expressive title, Henry the Navigator.

CIRCUMSTANTIAL EVIDENCE.

FIFTH CASE.

In the year 1689, there lived in Paris a woman of fashion, called Lady Mazel. Her house was large, and four stories high; on the ground floor was a large servants' hall, in which was a grand staircase, and a cupboard where the plate was locked up, of which one of the chambermaids kept the key. In a small room partitioned off from the hall, slept the valet-de-chambre, whose name was Le Brun: the rest of this floor consisted of apartments in which the lady saw company, which was very frequent and numerous, as she kept public nights for play. In the floor up one pair of stairs, was the lady's own chamber, which was in the front of the house, and was the innermost of three rooms from the grand staircase. The key of this chamber was usually taken out of the door and laid on a chair by the servant who was last with the lady, and who pulling the door after her, it shut with a spring, so that it could not be opened from without. In this chamber, also, were two doors; one communicated with a back staircase, the other with a wardrobe, which opened to the back stairs also.

On the second floor slept the Abbé Poulard, in the only room which was furnished on that floor. On the third story were two chambers, which contained two chambermaids and two foot-boys; the fourth story consisted of lofts and granaries, whose doors were always open. The cook slept below in a place where the wood was kept, an old woman in the kitchen, and the coachman in the stable.

On the 27th of November, being Sunday, the two daughters of Le Brun, the valet, who were eminent milliners, waited on the lady, and were kindly received; but as she was going to church to afternoon service, she pressed them to come again, when she could have more of their company. Le Brun attended his lady to church, and then went to another himself; after which he went to play at bowls, as was customary at that time, and from the bowling-green he went to several places; and after supping with a friend, he went home seemingly cheerful and easy, as he had been all the afternoon. Lady Mazel supped with the Abbé Poulard as usual, and about eleven o'clock went to her chamber, where she was attended by her maids. Before they left her, Le Brun came to the door to receive his orders for the next day, after which one of the maids laid the key of the chamber door on the chair next it; they then went out, and Le Brun following them, shut the door after him, and talked with the maids a few minutes about his daughters, and then they parted, he seeming still very cheerful.

In the morning he went to market, and was jocular and pleasant with every body he met, as was his usual manner. He then returned home and transacted his usual business. At eight o'clock he expressed surprise his lady did not get up, as she usually rose at seven; he went to his wife's lodging, which was in the neighbourhood, and told her he was uneasy his lady's bell had not rung, and gave her seven louis d'ors, and some crowns in gold, which he desired her to lock up, and then went home again, and found the servants in great consternation at hearing nothing of their lady; when one observed, that he feared she had been seized with an apoplexy, or a bleeding at the nose, to which she was subject; Le Brun said, "It must be something worse; my mind misgives me, for I found the street door open last night after all the family were in bed but myself." They then sent for the lady's son, M. de Savoniere, who hinted to Le Brun his fear of an apoplexy. Le Brun said, "It is certainly something worse; my mind has been uneasy ever since I found the street door open last night after the family were in bed." A smith being now brought, the door was broke open, and Le Brun entering first, ran to the bed; and after calling several times, he drew back the curtains, and said, "Oh, my lady is murdered!" He then ran into the wardrobe, and took up the strong box, which being heavy, he said, "She has not been robbed; how is this?"

A surgeon then examined the body, which was covered with no less than fifty wounds; they found in the bed, which was full of blood, a scrap of a cravat of coarse lace, and a napkin made into a nightcap, which was bloody, and had the family mark on it; and from the wounds in the lady's hands, it appeared she had struggled hard with the murderer, which obliged him to cut the muscles before he could disengage himself. The bell-strings were twisted round the frame of the tester, so that they were out of reach and could not ring. A clasp-knife was found in the ashes, almost consumed by the fire, which had burned off all marks of blood that might have ever been upon it; the key of the chamber was gone from the seat by the door; but no marks of violence appeared on any of the doors, nor were there any signs of a robbery, as a large sum of money, and all the lady's jewels, were found in the strong box, and other places.

Le Brun being examined, said, that "after he left the maids on the stairs, he went down into the kitchen;

he laid his hat and the key of the street door on the table, and sitting down by the fire to warm himself, he fell asleep; that he slept, as he thought, about an hour, and going to lock the street door, he found it open; that he locked it, and took the key with him to his chamber." On searching him, they found in his pocket a key, the wards of which were new filed, and made remarkably large; and on trial it was found to open the street door, the antechamber, and both the doors in Lady Mazel's chamber. On trying the bloody nightcap on Le Brun's head, it was found to fit him exactly, whereupon he was committed to prison.

On his trial it appeared as if the lady was murdered by some person who had been let in by Le Brun for that purpose, and had afterwards fled. It could not be done by himself, because no blood was upon his clothes, nor any scratch on his body, which must have been on the murderer from the lady's struggling; but that it was Le Brun who let him in, seemed very clear: none of the locks were forced; and his own story of finding the street door open, the circumstances of the key and the nightcap, also a ladder of ropes being found in the house, which might be supposed to be laid there by Le Brun, to take off the attention from himself, were all interpreted as strong proofs of his guilt; and that he had an accomplice was inferred, because part of the cravat found in the bed was discovered not to be like his; but the maids deposed they had washed such a cravat for one Berry, who had been a footman to the lady, and was turned away about four months before for robbing her. There was also found in the loft at the top of the house, under some straw, a shirt very bloody, but which was not like the linen of Le Brun, nor would it fit him.

Le Brun had nothing to oppose to these strong circumstances, but an uniformly good character, which he had maintained during twenty-nine years he had served his lady; and that he was generally esteemed a good husband, a good father, and a good servant. It was therefore resolved to put him to the torture, in order to discover his accomplices. This was done with such severity, on February 23, 1690, that he died the week after of the hurts he received, declaring his innocence with his dying breath.

About a month after, notice was sent from the provost of Sens that a dealer in horses had lately set up there by the name of John Garlet, but his true name was found to be Berry, and that he had been a footman in Paris. In consequence of this he was taken up, and the suspicion of his guilt was increased by his attempting to bribe the officers. On searching him, a gold watch was found, which proved to be Lady Mazel's. Being brought to Paris, a person swore to seeing him go out of Lady Mazel's the night she was killed, and a barber swore to shaving him next morning, when, on his observing the hands of his customer to be very much scratched, Berry said he had been killing a cat.

On these circumstances he was condemned to the torture, and afterwards to be broken alive on the wheel. On being tortured, he confessed, that, by the direction and order of Madame de Savoniere (Lady Mazel's daughter), he and Le Brun had undertaken to rob and murder Lady Mazel, and that Le Brun murdered her, whilst he stood at the door to prevent surprise. In the truth of this declaration he persisted till he was brought to the place of execution, when, begging to speak with one of the judges, he recanted what he had said against Le Brun and Madame de Savoniere, and confessed "that he came to Paris on the Wednesday before the murder was committed. On the Friday evening he went into the house, and, unperceived, got into one of the lofts, where he lay till Sunday morning, subsisting on apples and bread which he had in his pockets; that about eleven o'clock on Sunday morning, when he knew the lady had gone to mass, he stole down to her chamber, and the door being open, he tried to get under her bed, but it being too low, he returned to the loft, pulled off his coat and waistcoat, and returned to the chamber a second time in his shirt; he then got under the bed, where he continued till the afternoon, when Lady Mazel went to church; that knowing she would not come back soon, he got from under the bed, and being incommoded with his hat, he threw it under the bed, and made a cap of a napkin which lay on a chair, secured the bell-strings, and then sat down by the fire, where he continued till he heard her coach drive into the courtyard, when he again got under the bed, and remained there; that Lady Mazel having been in bed about an hour, he got from under the bed and demanded her money; she began to cry out, and attempted to ring, upon which he stabbed her, and she resisting with all her strength, he repeated his stabs till she was dead; that he then took the key of the wardrobe cupboard from the bed's head, opened this cupboard, found the key of the strong box, opened it, and took out all the gold he could find, to the amount of about six hundred livres; that he then locked the cupboard and replaced the key at the bed's head, threw his knife into the fire, took his hat from under the bed, left the napkin in it, took the key of the chamber from the chair, and let himself out, went to the loft, where he pulled off his shirt and cravat, and, leaving them there, put on his coat and waistcoat, and stole softly down stairs; and finding the street door only on the single lock, he opened it, went out, and left it open; that he had brought a rope-ladder to let himself down from a window, if he had found the street door double-locked; but finding it otherwise, he left his rope-ladder at the bottom of the stairs, where it was found."

Thus was the veil removed from this deed of dark-

ness, and all the circumstances which appeared against Le Brun were accounted for consistently with his innocence. From the whole story the reader will perceive how fallible human reason is when applied to *circumstances*; and the humane will agree, that in such cases even improbabilities ought to be admitted, rather than a man should be condemned, who may possibly be innocent.

DROLLERIES OF CAPTAIN GROSE.

In Grose's *Classical Dictionary of the Vulgar Tongue*, amidst much that is in various ways objectionable, there are a few scattered articles, of a whimsical nature, or explanatory of the origin of odd phrases now in common use, and which are therefore not unworthy of preservation. We select the following:—

Alls. The five alls is a country sign, representing five human figures, each having a motto under him. The first is a king in his regalia; his motto, I govern all: the second, a bishop in pontificals; motto, I pray for all: third, a lawyer in his gown; motto, I plead for all: fourth, a soldier in his regimentals, fully accoutred; motto, I fight for all: fifth, a poor countryman with his scythe and rake; motto, I pay for all.

Apron-String Hold. An estate held by a man during his wife's life.

Banyan Day. A sea term for those days on which no meat is allowed to the sailors: the term is borrowed from the Banyans in the East Indies, a caste that eat nothing that had life. [There are now no Banyan days in the royal navy.]

Barber. That's the barber; a ridiculous and unmeaning phrase, in the mouths of the common people about the year 1760, signifying their approbation of any action, measure, or thing.

Barnaby. An old dance to a quick movement. See Cotton, in his *Virgil Travesti*; where, speaking of Eolus, he has these lines:

Bounce cry the port-holes, out they fly,
And make the world dance Barnaby.

Bayard of Ten Toes. To ride bayard of ten toes is to walk on foot. Bayard was a horse famous in old romances.

Bear. One who contracts to deliver a certain quantity or sum of stock in the public funds, on a future day, and at a stated price; or, in other words, sells what he has not got, like the huntsman in the fable, who sold the bear's skin before the bear was killed. As the bear sells the stock he is not possessed of, so the bull purchases what he has not money to pay for; but in case of any alteration in the price agreed on, either party pays or receives the difference. *Exchange Alley.*

Beef-Eater. A yeoman of the guards, instituted by Henry VII. Their office was to stand near the bouffet, or cupboard, thence called Bouffetiers, since corrupted to Beef-Eaters. Others suppose they obtained this name from the size of their persons, and the easiness of their duty, as having scarce more to do than to eat the king's beef.

To bear the Bell. To excel or surpass all competitors, to be the principal in a body or society; an allusion to the fore horse or leader of a team, whose harness is commonly ornamented with a bell or bells. Some suppose it a term borrowed from an ancient tournament, where the victorious knights bore away the *belle* or *fair lady*. Others derive it from a horse-race, or other rural contentions, where bells were frequently given as prizes.

Bishoped, or to bishop. A term among horse-dealers for burning the mark into a horse's tooth after he has lost it by age; by bishoping, a horse is made to appear younger than he is. It is a common saying of milk that is burnt to, that the bishop has set his foot in it. Formerly, when a bishop passed through a village, all the inhabitants ran out of their houses to solicit his blessing, even leaving their milk, &c. on the fire to take its chance, which, when burnt to, was said to be bishoped.

Blackguard. A shabby, dirty fellow; a term said to be derived from a number of dirty, tattered, and roguish boys, who attended at the Horse Guards, and Parade in St James's Park, to black the boots and shoes of the soldiers, or to do any other dirty offices. These, from their constant attendance about the time of guard mounting, were nicknamed the black-guards.

Blarney. He has licked the Blarney stone; he deals in the wonderful. The Blarney stone is a triangular stone on the very top of an ancient castle of that name, in the county of Cork in Ireland, extremely difficult of access, so that to have ascended to it was considered as a proof of perseverance, courage, and agility, whereof many are supposed to claim the honour who never achieved the adventure: and to tip the blarney, is figuratively used for telling a marvellous story, or falsity, and also sometimes to express flattery. *Irish.*

Bore. A tedious troublesome man or woman, one who bores the ears of his hearers with an uninteresting tale; a term much in fashion about the years 1780 and 1781.—[This came again into fashion after Grose's day, and, we need not say, is still in use.]

Brace. The brace tavern; a room in the south-east corner of the King's Bench, where, for the convenience of prisoners residing thereabouts, beer purchased at the tap-house was retailed at a halfpenny per pot advance. It was kept by two brothers of the name of Partridge, and thence called the *Brace*.

Bull. An Exchange Alley term for one who buys stock on speculation for time, that is, agrees with the seller, called a *Bear*, to take a certain sum of stock at a

future day at a stated price: if at that day stock fetches more than the price agreed on, he receives the difference; if it falls or is cheaper, he either pays it or becomes a lame duck, and waddles out of the Alley. See *BEAR*.

Bull. A blunder; from one Obadiah Bull, a blundering lawyer of London, who lived in the reign of Henry VII.: by a bull is now always meant a blunder made by an Irishman.

Butt. A dependent, poor relation, or simpleton, on whom all kinds of practical jokes are played off, and who serves as a butt for all the shafts of wit and ridicule.

Camerade. A chamber fellow; a Spanish military term. Soldiers were in that country divided into chambers, five men making a chamber; whence it [the term *camerade*, now pronounced *comrade*] was generally used to signify companion.

Captain. Led captain; an humble dependent in a great family, who, for a precarious subsistence, and distant hopes of preferment, suffers every kind of indignity, and is the butt of every species of joke or ill humour. The small provision made for officers of the army and navy in time of peace, obliges many in both services to occupy this wretched station. The idea of the appellation is taken from a led horse, many of which for magnificence appear in the retinues of great personages on solemn occasions, such as processions, &c.

Captain Copperthorne's Crew. All officers; a saying of a company where every one strives to rule.

Cater Cousins. Good friends. He and I are not cater cousins, that is, we are not even cousins in the fourth degree, or four times removed; or, we have not the least friendly connection.

Caterpillar. A nickname for a soldier. In the year 1745, a soldier quartered at a house near Derby was desired by his landlord to call upon him whenever he came that way, for, added he, soldiers are the pillars of the nation. The rebellion being finished, it happened the same regiment was quartered in Derbyshire, when the soldier resolved to accept of his landlord's invitation, and accordingly obtained leave to go to him: but on his arrival he was greatly surprised to find a very cold reception; whereupon expostulating with his landlord, he reminded him of his invitation, and the circumstance of his having said soldiers were the pillars of the nation. "If I did," answered the host, "I meant *caterpillars*."

Choak Pear. Figuratively, an unanswerable objection: also a machine formerly used in Holland by robbers; it was of iron, shaped like a pear; this they forced into the mouths of persons from whom they intended to extort money, and, on turning a key, certain interior springs thrust forth a number of points in all directions, which so enlarged it that it could not be taken out of the mouth: and the iron, being case-hardened, could not be filed: the only methods of getting rid of it were either by cutting the mouth, or advertising a reward for the key. These pears were also called pears of agony.

Crump. One who helps solicitors to affidavit men, or false witnesses. "I wish you had, Mrs Crump;" a Gloucestershire saying, in answer to a wish for any thing; implying, you must not expect any assistance from the speaker. It is said to have originated from the following incident:—One Mrs Crump, the wife of a substantial farmer, dining with the old Lady Coventry, who was extremely deaf, said to one of the footmen waiting at table, "I wish I had a draught of small beer," her modesty not permitting her to desire so fine a gentleman to bring it. The fellow, conscious that his mistress could not hear either the request or answer, replied, without moving, "I wish you had, Mrs Crump." These wishes being again repeated by both parties, Mrs Crump got up from the table to fetch it herself, and being asked by my lady where she was going, related what had passed. The story being told abroad, the expression became proverbial.

Cur. A cut or curtailed dog. According to the forest laws, a man who had no right to the privilege of the chase was obliged to cut or law his dog. Among other modes of disabling him from disturbing the game, one was by depriving him of his tail: a dog so cut was called a cut or curtailed dog, and by contraction a *cur*. A *cur* is figuratively used to signify a surly fellow.

Curse of Scotland. The nine of diamonds: diamonds, it is said, imply royalty, being ornaments to the imperial crown, and every ninth king of Scotland has been observed, for many ages, to be a tyrant and a curse to that country. Others say it is from its similarity to the arms of Argyle; the Duke of Argyle having been very instrumental in bringing about the union, which by some Scotch patriots has been considered as detrimental to their country.—[Another explanation we have heard is, that the order for the massacre at Glencoe in 1691 was written hastily on the back of a card which the commanding officer had that evening employed in playing with his victims.]

Dowdying. A local joke formerly practised at Salisbury, on large companies, or persons boasting of their courage. It was performed by one Pearce, who had the nack of simulating madness, and who, by the direction of some of the company, would burst into a room, in a most furious manner, as if just broke loose from his keeper, to the great terror of those not in the secret. Dowdying became so much the fashion of the place, that it was exhibited before his Royal Highness the Prince of Wales, father of George III. Pearce obtained the name of Dowdy, from a song he used to sing, which had for its burthen the words *dow de dow*.

Dun. An importunate creditor. Dunny, in the provincial dialect of several counties, signifies *deaf*; to dun, then, perhaps may mean to deafen with importunate demands: some derive it from the word *donner*, which signifies *give*. But the true original meaning of the word owes its birth to one Joe Dun, a famous bailiff of the town of Lincoln, so extremely active, and so dexterous in his business, that it became a proverb, when a man refused to pay, Why do not you *Dun* him? that is, Why do not you set Dun to arrest him? Hence it became a cant word, and is now as old as since the days of Henry VII. Dun was also the general name for the hangman, before that of Jack Ketch:

And presently a halter got,
Made of the best strong hempen tear,
And ere a cat could lick her ear,
Had tied it up with as much art,
As DUN himself could do for 's heart.

Cotton's *Virgil Trav.* book iv.

Fellow-Commoner. An empty bottle: so called at the University of Cambridge, where fellow-commoners are not in general considered as over-full of learning. At Oxford an empty bottle is called a gentleman-commoner for the same reason.

Firing a Gun. Introducing a story by head and shoulders. A man, wanting to tell a particular story, said to the company, "Hark! did you not hear a gun? Now we are talking of guns, I will tell you a story of one."

Flip. Small beer, brandy, and sugar: this mixture, with the addition of a lemon, was by sailors formerly called Sir Cloudly, in memory of Sir Cloudly Shovel, who used frequently to regale himself with it.

Grey Mare. The grey mare is the better horse; said of a woman who governs her husband.—[The origin of this phrase is given as follows in *Addison's Anecdotes*, 1794:—"A gentleman in a certain county in England having married a young lady of considerable fortune, and with many other charms, yet finding, in a very short time, that she was of a high domineering spirit, and always contending to be mistress of him and his family, he was resolved to part with her. Accordingly, he went to her father, and told him he found his daughter of such a temper, and was so heartily tired of her, that if he would take her home again, he would return every penny of her fortune.

The old gentleman, having inquired into the cause of his complaint, asked him, 'why he should be more disquieted at it than any other married man, since it was the common case with them all, and, consequently, no more than he ought to have expected when he entered into the married state.' The young gentleman desired to be excused, 'if he said he was so far from giving his assent to this assertion, that he thought himself more unhappy than any other man, as his wife had a spirit no way to be quelled; and as most certainly no man, who had a sense of right and wrong, could ever submit to be governed by his wife.' 'Son,' said the old man, 'you are but little acquainted with the world, if you do not know that all women govern their husbands, though not all, indeed, by the same method: however, to end all disputes between us, I will put what I have said on this proof, if you are willing to try it. I have five horses in my stable; you shall harness these to a cart, in which I shall put a basket containing one hundred eggs; and if, in passing through the county, and making a strict inquiry into the truth or falsehood of my assertion, and leaving a horse at the house of every man who is master of his family himself, and an egg only where the wife governs, you will find your eggs gone before your horses; I hope you will then think your own case not uncommon, but will be contented to go home, and look upon your own wife as no worse than her neighbours. If, on the other hand, your horses are gone first, I will take my daughter home again, and you shall keep her fortune.'

This proposal was too advantageous to be rejected; our young married man, therefore, set out with great eagerness to get rid, as he thought, of his horses and his wife.

At the first house he came to, he heard a woman, with a shrill and angry voice, call to her husband to go to the door. Here he left an egg, you may be sure, without making any further inquiry; at the next he met with something of the same kind; and at every house, in short, until his eggs were almost gone, when he arrived at the seat of a gentleman of family and figure in the county: he knocked at the door, and inquiring for the master of the house, was told by a servant that his master was not yet stirring, but if he pleased to walk in, his lady was in the parlour. The lady, with great complaisance, desired him to seat himself, and said, if his business was very urgent, she would wake her husband to let him know it, but had much rather not disturb him. 'Why, really, madam,' said he, 'my business is only to ask a question, which you can resolve as well as your husband, if you will be ingenious with me. You will doubtless think it odd, and it may be deemed impolite for any one, much more a stranger, to ask such a question; but as a very considerable wager depends upon it, and it may be some advantage to yourself to declare the truth to me, I hope these considerations will plead my excuse. It is, madam, to desire to be informed whether you govern your husband, or he rules over you?' 'Indeed, sir,' replied the lady, 'this question is somewhat odd; but as I think no one ought to be ashamed of doing their duty, I shall make no scruple to say that I have been always proud to obey my husband in all things; but if a woman's own word is to be suspected in such a case, let him answer for me: for here he comes.'

The gentleman at that moment entering the room, and, after some apologies, being made acquainted with the business, confirmed every word his obedient wife had reported in her own favour; upon which he was invited to choose which horse in the team he liked best, and to accept of it as a present.

A black gelding struck the fancy of the gentleman most; but the lady desired he would choose the grey mare, which she thought would be very fit for her side saddle; her husband gave substantial reasons why the black horse would be most useful to them, but madam still persisted in her claim to the grey mare. "What," said she, "and will you not take her then? But I say you shall; for I am sure the grey mare is much the better horse." "Well, my dear," replied the husband, "if it must be so —," "You must take an egg," replied the gentleman carter, "and I must take all my horses back again, and endeavour to live happy with my wife."

High Jinks. A gambler at dice, who, having a strong head, drinks to intoxicate his adversary, or pigeon.—[It would appear from *Guy Mannering* that this phrase came to have a different meaning in Scotland.]

Hobson's Choice. That or none: from old Hobson, a famous carrier of Cambridge, who used to let horses to the students, but never permitted them to choose, always allotting each man the horse he thought most proper for his manner of riding and treatment.

Hunt's Dog. He is like Hunt's dog, will neither go to church nor stay at home. One Hunt, a labouring man at a small town in Shropshire, kept a mastiff, who on being shut up on Sundays, whilst his master went to church, howled so terribly as to disturb the whole village; wherefore his master resolved to take him to church with him. But when he came to the church door, the dog having perhaps formerly been whipped out by the sexton, refused to enter; whereupon Hunt exclaimed loudly against his dog's obstinacy, who would neither go to church nor stay at home. This shortly became a byword for discontented and whimsical persons.

THE WRONG LETTER-BOX.

[BY MR CHANDLER—UNITED STATES GAZETTE.]

AMUSING incidents often occur by persons mistaking the letter-box of stores and newspaper offices in this vicinity for that of the post-office. We sometimes find three or four letters in our own letter-box intended for the mails. These we of course put on their way.

Standing once at our front window, we observed a young woman, whose face was not visible to us, drop a letter into our box, and on taking it out we found that she had mistaken our establishment for that of the post-office. It was directed to Thomas —, in Ireland, and the inland postage accompanied it. The letter we caused to be sent with some others to the post-office, and gave the circumstance no further thought.

Besides some months afterwards in examining the contents of our exchange papers, and inditing such paragraphs as they suggested to us, we did not pay much attention to a gentle tap at the door of our private room, until it was repeated. We then, too anxious to conclude our labours to open to the applicant, bade the one that knocked "come in," and continued our labours without lifting an eye to the door, which was opened quietly, and as quietly closed. We were startled at length with a sweetly modulated voice inquiring, "Is there a letter here for me?"

We at once raised our eyes and saw a female about eighteen years of age—or, as we have of late lost the art of judging closely in these matters, perhaps twenty. It did not make a dimple's difference to her face, and would not, if five more years had been added to them. There was an oval face, with nature's own blush, and a slight projection of the mouth that told of Ireland, even without the softened modulation of voice that belongs to the women of that island. Neatness was all that could be ascribed to her dress—it deserved that.

Letters are frequently asked for in a newspaper office, in reply to advertisements—so we bade the young woman go to the front office, and inquire of the clerks.

She had been there, and there was no one but a boy, who could not give her the information.

So we inquired the name.

"Kitty MacInnes; but, perhaps, it will be Catherine on the letter," said she, "as that is my name."

We looked on the letter-rack in the front office, among the "A. B.'s," the "X. W.'s," the "P. Q.'s," &c., but saw none for Catherine.

Returning, we inquired to what advertisement the letter was to be an answer. "Advertisement! to no advertisement—it would be in answer to my letter."

"And from whom did you expect a letter?"

The young woman looked much confused; but apparently considering the question pertinent, she said, "From Thomas —."

We saw at once that she had, as hundreds before had done, mistaken our office for the post-office, and the name given was that upon the letter which we had some months before sent from our letter-box to that of the post-office.

"He has not written, then," said Catherine, in a low voice, evidently not intended for our ear.

"But—he may have written."

"Then where's the letter?" said she, looking up.

"At the post-office, perhaps."

And we took Catherine by the hand and led her to the door, and pointed out the way to the post-office.

"You will ask at the window," said we; "but as the clerks are young men, you need not tell them from whom you expect the letter."

"Not for the world," said she, looking into our face with a glance that seemed to say there was no harm in telling us.

We must have used less than our usual precision in

directing Catherine to the post-office, as quite half an hour afterwards, when visiting the place, we saw her at the window, receiving the change and a letter from one of the clerks, and the impatience, shall we say of woman or of love, induced Catherine to break the seal at the door. A glow of pleasure was on the cheek of the happy girl. We would not have given a penny to be informed that Thomas was well, and was coming in the next packet. We felt anxious to know whether Thomas would come, but the names of such persons rarely appear among the passengers of the Liverpool packets, being commonly included in that comprehensive line, "and two hundred in the steerage."

So we gave up all hopes of knowing when Thomas would arrive, but concluded that we should see the name with that of Catherine in the marriage list, to which we had determined to keep a steady look.

It was but a short time afterwards that we did indeed see the name of Thomas in the papers. He was one of the passengers in the ship east away below New York, of whom nearly every one perished, and Thomas among the rest.

We had never seen Thomas, but had somehow cherished such an interest in his fate, that we felt a severe shock at its announcement; and what must have been the feelings of Catherine, with her ardent sanguine Irish temperament? Loving deeply as she must have loved, and hoping ardently as she must have hoped, what must have been her feelings?

We paused a few weeks afterwards to mark the young grass shooting green and thick, in Ronaldson's graveyard, and to see the buds swelling on the branches of the trees that decorate that populous city of the dead, when a funeral, numerously attended, wound slowly round the corner of the street, and passed into the enclosure. It was the funeral of a native of Ireland—we knew by the numbers that attended—and as the sexton lowered the coffin down into the narrow house, the place appointed for all the living, we saw engraved upon a simple plate, CATHERINE MACINNES.

The story was told. The small sum of money which Catherine had deposited in the savings' fund, to give a little consequence to her marriage festival, had been withdrawn to give her "decent burial."

THE OLD FARM GATE.

Where, where is the gate that once served to divide
The elm-shaded lane from the dusty road side?
I like not this barrier gaily bedight,
With its glittering latch and its trolleys of white.
It is seemly, I own—yet, oh! dearer by far
Were the red-rusted hinge and the weather-warped bar.
Here are fashion and form of a modernised date,
But I'd rather have look'd on the old farm gate.

'Twas here where the urchins would gather to play
In the shadows of twilight or sunny mid-day;
For the stream running nigh and the hillocks of sand
Were temptations no dirt-loving rogue could withstand.
But to swing on the gate-rails, to clamber and ride,
Was the utmost of pleasure, of glory and pride;
And the car of the victor or carriage of state
Never carried such hearts as the old farm gate.

'Twas here where the miller's son paced to and fro,
When the moon was above and the glow-worms below;
Now pensively leaning, now twirling his stick,
While the moments grew long and his heart-throbs grew quick.
Why, why did he linger so restlessly there,
With church-going vestment and sprucely-combed hair?
He loved, oh! he loved, and had promised to wait
For the one he adored at the old farm gate.

'Twas here where the grey-headed gossips would meet,
And the falling of markets or goodness of wheat—
This field lying fallow—that heifer just bought—
Were favourite themes for discussion and thought.
The merits and faults of a neighbour just dead—
The hopes of a couple about to be wed;
The Parliament doings—the bill and debate,
Were all canvassed and weighed at the old farm gate.

'Twas over that gate I taught Pincher to bound
With the strength of a steed and the grace of a hound;
The beagle might hunt and the spaniel might swim,
But none could leap over that post-ern like him.
When Dobbin was saddled for mirth-making trip,
And the quickly-pul'd willow-branch served for a whip,
Spite of lunging and tugging he'd stand for his freight,
While I climbed on his back from the old farm gate.

'Tis well to pass portals where pleasure and fame
May come winging our moments and gilding our name;
But, give me the joy and the freshness of mind;
When away on some sport—the old gate slam'd behind—
I've listened to music, but none that could speak
In such tones to my heart as the teeth-setting creak
That broke on my ear when the night had worn late,
And the dear ones came home through the old farm gate.

Oh! fair is the barrier taking its place,
But it darkens a picture my soul longed to trace.
I sigh to behold the rough staple and hasp
And the rails that my growing hand scarcely could clasp.
Oh! how strangely the warm spirit grudges to part
With the commonest relic once linked to the heart;
And the brightest of fortune—the kindest fate—
Would not banish my love for the old farm gate.

—*Weekly Dispatch*, April 21, 1830.

ELIZA COOK.

RULES OF HEALTH.

The celebrated physician, Boerhaave, declared some time before his death, that he had in his library a book which contained the most important secrets of medicine. When his library was examined, there was a book magnificently bound; it consisted of blank paper, with the exception of these words written on the first leaf—"Keep your head cool and your feet warm, and your bowels open, and you may laugh at physicians."

LAW AGAINST DUELLING.

The king of Naples has published a severe and efficient law against duelling. A challenge to fight a duel, either written or verbal, is punishable by imprisonment in the third degree, with disqualification for all public functions, and the loss of all public pensions, for from two to five years after the expiration of the punishment. A person who accepts a challenge is subject to the same punishment. Any act of violence committed against a person in consequence of refusing to accept a challenge, shall be punished according to the existing laws, but the rate of punishment shall be increased one degree above what it is in ordinary cases. If a challenge be accepted, and the parties meet, but the duel does not take place, they shall be punished by banishment and the loss of pensions. If the duel takes place, without either party being wounded, they shall be punished by irons in the first degree, with the loss of pensions. If wounds follow, the wounded party shall be punished as above, and the party inflicting the wound shall be punished according to the existing laws. Murder committed in a duel shall be punished as assassination. The body of a person killed in a duel, and also of one who shall suffer death in consequence of a duel, shall be buried in a profane place, designated by the police, without funeral ceremony, and without any monument. Seconds, bearers of a challenge, and all who take part in a duel, shall be punished as principals. Military men, besides being subject to the dispositions of this decree, shall be punished by the military penal statute for insubordination.—*New York Mirror*.

EFFECTS OF LAUGHTER ON THE CIRCULATION OF THE BLOOD.

The deep inspirations and the short and frequent expirations made in the act of laughing, have a direct influence on the heart, increasing the quantity of blood within its cavities in the same manner as the quantity within these is increased by muscular contractions. This condition of the heart, as might be anticipated, will vary in proportion to the violence and duration of the paroxysms of laughter. When these are moderate, the mind is only exhilarated, or, to use a common expression, "the heart becomes joyful;" but if laughing be increased or prolonged beyond certain limits, a series of effects, more or less injurious, frequently supervene. Pain in the cardiac region and headache then come on, and if the paroxysm be immoderate, the quantity of blood propelled into the brain is such, that the intellectual powers become greatly excited, and sometimes to such a degree as to cause their temporary aberration. Even convulsions follow immoderate fits of laughter, and I have known death take place from excessive laughter caused by titillation. A disturbed action of the heart is usually observed in those affected with hysteria, which may account for the paroxysm of laughter, the *risus sardonicus*, the hiccup, and all the more remarkable phenomena which are characteristic of that disease. Laughter, indeed, greatly disturbs a heart which is already irritable. This was strikingly exemplified in a person who had a disease of the heart, and who could not indulge in laughing, without the increased action of the heart by which it was accompanied always causing violent headache.—*Wardrop on Diseases of the Heart*.

GREAT NATURAL BREAKWATER.

It is well known that reefs of rock, generally coral, extend along many coasts at a short distance from shore, and when concealed from the mariner, or unknown to him, are a frequent cause of shipwreck. Occasionally they rise so far above water as to be easily discerned, stretching for many miles with the regularity of an artificial bulwark raised for the protection of the land. Many of the islands which in such vast numbers stud the Pacific Ocean, are almost wholly encircled by a coral belt of this description. But the coast of Brazil presents, probably, the most remarkable reef to be found on the globe. Mrs. Graham, an intelligent writer on Brazil, pronounces it "certainly one of the wonders of the world." It is about sixteen feet in breadth at the top; on the outside it slopes off, more rapidly than the celebrated Plymouth breakwater, to a great depth, and within it is perpendicular for many fathoms. Mr. Koster informs us that it extends all along the coast from Pernambuco to Maranhão, a distance of nearly one thousand miles. In some parts it runs very near the coast, in others it recedes to a distance from it. Occasionally it declines in height to a level with the water, and even sinks below it; but for the most part it is a bold and high wall of rock, presenting at intervals numerous openings like sea-gates, where vessels may enter at all seasons, and ride as secure from tempests as if they were anchored in a small lake. The harbour of Pernambuco is formed by this magnificent bulwark. Mrs. Graham thus describes the entrance:—"We approached the sandy beach between Recife (or Pernambuco) and Olinda so nearly, that I thought we were going to land there; when, coming abreast of a tower on a rock where the sea was breaking violently, we turned short round, and found ourselves within a natural breakwater, heard the surf dashing without, and saw the spray, but we ourselves were sailing along smoothly and calmly as if in a mill-pond. The reef of which the rock is formed, is said to be coral; but it is so coated with barnacle and limpet, that I could see nothing but the remainder of these shells for many feet down, and as deep into the rock as our hammers would break." The breadth of the water here between the reef and the mainland, varies from a few fathoms to three quarters of a mile. Close to the rock the water is of considerable depth, and there the vessels often moor.

LONDON: Published, with permission of the proprietors, by W.S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

PRICE THREE HALFPENCE.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"IT'S ONLY A BIT OF A STRETCH!"

"AND were there many at the race, Pierce?"

"Many, is it many, aunt? Faith, I believe ye; thousands upon thousands!"

"And did many horses run, Pierce?"

"Ay, hundreds!"

"Oh, Pierce, how could that be!—there would not be room; and, besides, I'm astonished at the people's coming or t in the teams of rain."

"Och, aunt, ye're such a both r! Warn't there hundreds of tents to shelter them?"

"Is it to shelter *thousands*, Pierce?" said his aunt Kitty, laying down her knitting, and looking with her pale blue eyes steadfastly in his face.

"Lord! aunt, how can you go on believing every word a fellow says?"

"That's true, my dear, when you are 'the fellow,'" answered aunt Kitty in her usual placid way.

"Sure," he continued, "there were plenty of people on the race-course, and that's all as one as thousands; and there were plenty of horses, and a good sprinkling of tents; but, aunt, you drive all the spirit out of a man with your regulation questions. I tell you, you drive all the spirit out of me."

"Then I do very wrong," replied aunt Kitty, smiling. "I only want to exchange spirits—the spirit of truth for the spirit of falsehood."

"Falsehood, aunt!"

"Lying—whether black or white—if it pleases you better."

"By the powers!—and they're a large family—I wouldn't let a man say that of me."

"You could not prevent his thinking it."

"No man should dare tell me I was a liar!"

"I dare say not, Mr Pierce Scanlan. You quarrelled last week with Miles Pendergast for repeating, as if it had been truth, what you *afterwards* said was a jest, and then you quarrelled with him for saying that something else was falsehood which you wished to be understood was truth. You said on both occasions you'd blow his brains out; but you have stated your intention of doing so towards so many, that I suppose my friend Miles still has his brains. I hope he will keep them cool."

"I wish," exclaimed the young farmer, "I wish my mother had been any thing but an English woman."

"Why, Pierce?"

"Why, because then I should not have had an English aunt to fuss about nothing. Now, don't look angry; no, not angry; you never look angry, that's the d—l of it—Nor don't blow me up—but no, that's as bad, you never blow me up; if you did, there would be some comfort in it, but you won't do either. You won't do any thing but reason with me—it is really enough to make a fellow mad!"

"To be reasoned with!"

"Ay, to be reasoned with. My father used to say it was one of the privileges of an Irish husband, that he was never expected to listen to reason."

"Irish husbands," said aunt Kitty very solemnly, while preparing to take up a stitch she had just dropped, "are, generally speaking, great tyrants; they have the most tender affectionate wives in the world, and they bluster their lives out. Storm!—storm!—fly!—fly!—and then (as was the case with my poor sister) when the trembling spirit has found refuge in the grave, they cry over her! Irish fathers are bad fathers!"

"Oh, Kitty, Kitty, if you warn't my aunt!"

"But I *am* your aunt. I left my home and my country, when the Almighty took your parents, to share what I had with my sister's children. All I want is for you to *hear* me."

"Aunt, you want us to *heed* you too."

"Not unless your reason is convinced, Pierce."

"Bother the reason, aunt! I want to have no call to it; and I hope you won't be coming over what you said just now to Eliza Byrne about Irish husbands."

"Irish husbands are generally bad, and Irish fathers are even worse."

"Oh, aunt, why, their *love* for their children goes beyond every thing."

"And their care for their comfort and prosperity amounts to nothing. Peer and peasant live up to what they have, and leave their children the Irish heritage of beggary. How did your own father leave you and your three little sisters? It breaks my heart when I think of it! You're a good boy, Pierce; a kind-hearted boy, if you'd give up *stretching*; only stick to the truth, the bright ornament, Pierce. I do think if you would, you'd be almost as good a husband as an Englishman, as wise as one as a Scotch."

"Will you say that to Eliza Byrne, aunt? Do, aunt, like a darling, and I won't give a *stretch* for a week!"

"Talking of Eliza Byrne," said his kind, but peculiar aunt Kitty, "now I think of it, Eliza heard something you had said of Lucy Flynn that has cut her up very much."

"Of Lucy Flynn?"

"Yes; either of Lucy or to Lucy, I am not sure which, so do not run away my story into a *stretch*. And, Pierce, what did you mean by saying that Brady owed Garrett more gold than his mare could carry, and that he'd be broke horse and foot if he could not pay?"

"Oh, by the powers," replied Pierce, colouring deeply, "I never said such a word, not that I remember; or, if I did, 'twas only a bit of a *stretch*, just to tease old Mother Brady, that thought to haul me over the coals about a bit of fun concerning her son and Ellen Graves. I meant no harm at the time. Any how, he does owe Brady a matter of ten pounds."

"Is that more than his mare could carry?"

"Oh, aunt Kitty, be easy; you're too bad entirely; faith, the town land's turning English upon us, observing every *stretch* a boy makes for diversion."

"There is plenty of diversion on the subject, I assure you," said his aunt. "Every lie in the parish is called a *Pierce Scanlan*."

"By the powers!" he exclaimed, "any man that says that, I'll break every bone in his body."

"Wouldn't it be easier to break yourself of the habit of *stretching*, as you call it?" inquired his aunt.

"Bad cess to the people that can't see a joke, and ye're enough, aunt, so you are, to set a body mad."

The interview had proceeded to this particular point, when Pierce's sisters Jane and Anne and little Mary entered together; they had taken a half holiday, and crossed the hill to spend it at Eliza Byrne's, and now returned, not laughing and talking as usual, but with sober steady countenances, and quiet footsteps. Each entered without speaking, and there were traces of tears on little Mary's cheeks.

"Holloa, girls!" exclaimed their really good-tempered brother, "have you been to a funeral?"

"Be easy with yer nonsense," said Jane.

"Too much of one thing is good for nothing," muttered Anne.

"I wonder at you, so I do, brother Pierce, to say what you did of Eliza Byrne," added little Mary.

"And your life isn't safe in the country, I can tell you," recommenced Jane; "for every one of the Brady's people are up as high as the Hill of Howth."

"And will have you as low down as the towers in Lough Neagh," added Anne.

"And Ellen Graves's father has been all the way to Newtownmountchallagharsane, to see 'torney Driscoll, to take the law of you for taking away his daughter's character."

"Easy, girls, for the love of the holy saints!—easy, I say," said Pierce, looking, as well he might, bewildered; "you open upon me for all the world like a

pack of hounds. Easy—one at a time!" exclaimed the brother; "easy with the hay, *avourneens*, and *inseens* me into it—quietly."

"Quietly!" repeated little Mary, who was the pet and the beauty of the family; "it's mighty easy to say quiet to the waves of the sea, and the storm whirling them about."

"A joke's a joke," said Jane; "but what right had ye to touch the girl's character?"

"And crying up Lucy Flynn before Eliza Byrne's brother's face. *She'll* have nothing more to say to you, I can tell you that," continued Anne.

"And meddling with the Bradys—the *quarrelsome* people in the five parishes; we'll have the house burned over our heads through you," sobbed little Mary.

"And be brought before judge and jury, if that 'torney Driscoll smells out the yellow guineas Ellen Graves's father keeps hid in the ould stocking in the thatch of his house; and oh! on the race ground—I forgot that—how could you say the councillor's *cowl* Conn was all head and tail like his owner! The councillor will be down on ye, ye misfortunate boy, as well as the 'torney!' said Jane.

"And that's not the worst of it; but, oh, Pierce, the *stretch* you made —"

"Whisht, Anne," interrupted Mary; "what was it all to compare to little Matty O'Hay's turning up his nose when I said my aunt could fine-plait better than the lady's maid at the castle; he turns up and round his ugly nose, that looks for all the world like a stray root of mangold-wortzel, and says 'he supposes that must be put down as another *Pierce Scanlan*.'"

"Did he say that?" exclaimed Pierce, jumping upwards to where three or four exceedingly well-looking, well-organised shillalas were "seasoning"—up the chimney; and bringing down his favourite at a spring, he weighed it carefully in his hand.

There is something particularly national and characteristic in the manner of an Irishman's weighing a shillala; the grasp he gives it is at once firm and tender; he poises it on his open palm, glancing his eye along its fair proportions; then his hand gently undulates; again he regards it with a look of intense and friendly admiration, grasps his fingers round it, so as to assure himself of its solidity, until the knuckles of his muscular hand become white, and the veins purple; then in an ecstasy of enjoyment he cuts a caper; and while his eyes sparkle, and a deep and glowing crimson colours his cheeks, he wheels his national weapon round his head, and the wild "whoop!" of the wild Irish rings through the air. So did Pierce, and "the whoop," intended as a sort of war-cry to the faction of the O'Hays, compelled his aunt Kitty to speak.

"My dear," said the good quiet English soul, fairly letting her knitting drop, and placing her fingers on her ears, "my dear Pierce, put down that dirty stick; don't make such a noise, but sit down, and *listen to reason!*" Now, let any one, understanding what an Irishman is in a state of excitement, imagine how Pierce received this well-intended but ill-timed admonition. Never had he been so badgered before; for a moment the stick was poised above his head, as if the good woman had been a sorceress, and had fixed it there; and then, uttering a deep oath, he rushed towards the door with something like a determination of cracking the pate of the first man he met, merely to get his hand in practice for what was to come. It is not, however, easy for a man to escape from four women, and they hung round him with such a tenacity of grasp, that he was literally dragged to "the settle."

"Now, my dear Pierce," said his aunt, when the cries and "ah, do's" and "ah, don't's" of the sisters had subsided, "will you listen to reason?"

"No!" roared Pierce, with the voice of a Stentor.

"Ah, do, aunty Kitty, let him alone for a minute or two," whispered little Mary; "it's no use now, and

LIBRARY U.C. RIVERSIDE

he foaming mad alive with the passion; let him come to a bit; or put," she added, judiciously, "an ould crock or something in his way for him to break: that always softens his temper."

Now, though aunt Kitty saw little Mary was right in both cases, she loved her "crock" too well to attend to the second admonition. She could not help thinking very truly what an immensity of harm is done by the *gaupish* and mean kind of wit which springs from falsehood; like the weeds growing upon rank and unwholesome soil, their fruit is poison; the innocent and playful mirth sparkling in the sunbeams of a warm imagination, and both giving and receiving pleasure, is healthful and inspiring; but in Ireland all classes are more or less cursed with a spirit of exaggeration, that, to my sobered senses, is nothing more nor less than unredeemable falsehood; there are a number of persons who have many good qualities, but I cannot respect them; they are perpetually lying. If they have walked a mile, they will tell you they have walked six; and if there is a crowd, it is magnified into thousands, like poor Pierce's people on the race-course. You must be, like Michael Cassio, "a good arithmetician," to deduct the item of truth from the million of falsehood. If you believe them, they are rude enough to laugh at you; and if you do not believe them, they are inclined to quarrel with you. Although I have in this instance made exaggeration a *peasant-failing*, I think the middle class are the most addicted to the vice of what I must call by its own vulgar name, "humbugging"—saying what is not true, that they may have the pleasure of laughing at those who do them the injustice to believe they have spoken truth.

In England we have no understanding for this spurious wit. No country cherishes truth as it deserves to be cherished; it is a blessed and a holy thing, but we do not in England *profess* to put truth to the blush. "He's a fine gentleman," said a cousin of Pierce Scanlan's to me, when speaking of his landlord; "he's a fine gentleman; the *very light of his eyes is truth*."

To those unaccustomed to the contradictions of the Irish character, it is extraordinary, that, in a neighbourhood where eight or nine young men live, all known to belong to the *humbugging* class, any should be found weak or foolish enough to credit a word they say; and yet those very "boys" will go on telling falsehoods of each other, at which they will laugh one moment, and about which (as is Pierce Scanlan's case) they will quarrel the next. It is very painful to associate with those who never reflect, that they sacrifice the moral dignity of manhood when they desecrate the temple of truth.

Pierce Scanlan's imagination was very vivid, and he loved a laugh; he had given himself the habit of speaking without consideration; and as the jollity of the many, stifled the annoyances and pains of the few, he had gone on until even those who confessed "he meant no harm" became annoyed at his practical jokes. Eliza Byrne had loved him, but not as well as he loved her; and the match was effectually broken off, at least for a time, by her brother, who declared, after what Pierce had said of Lucy, his sister should have nothing to say to him.

Now, Pierce had said this for a stretch, a sort of desire to cut a dash, by showing that he had two strings to his bow; but Eliza's feelings were wounded, and though she had known that Pierce was a "stretcher," she did not seem to care for the fault, until it reached herself. This is the way in general—we laugh at the jest, until it cuts home!

But to return to the cottage.

Pierce, although not wrought up to the pitch of being able to reason, was brought about by his sisters to think, though but little time was given either for that or any other consideration, for the Brady faction had mustered strong, and, stimulated by strong drink, entered the farm-house, to the terror of his sisters, and almost the death of his aunt; and taking the law, as they are too fond of doing, in their own hands, beat the unfortunate Pierce in a way that rendered him dumb for a long time on the subject of whatever debts the Bradys might contract. He had only done it for a stretch; but what of that!—it had come home to the Bradys; and although one and all they were rather sorry the next day for "being so hard on Pierce, pleasant boy!" still that was but a poor salvo for his aching bones and insulted pride.

Aunt Kitty undertook to talk over old Jem Graves, and Mary accompanied her aunt to prevent her "giving him too much English." I really think that Mary's bright eyes had more to do with the withdrawal of 'torney Driscoll's instructions touching "the bit of a stretch" which the honest old man imagined affected his daughter's fame, than all aunt Kitty's reasons. Pierce made him an earnest and ample apology, and thus prevented further trouble on that score. The councillor had taken umbrage at the licence Pierce had given to his imagination when speaking of "the colt." Words wound more deeply than swords; and long after the desire for fun had prompted the folly, the councillor remembered the foolish "jest" which Pierce had indulged in at the expense of him and his "colt," and refused Pierce a new lease of a couple of acres which he had much desired to retain, and which his father and grandfather had tilled. Aunt Kitty never could understand why it was that the Brady faction took the law into their own hands and thrashed her nephew, nor how it was that, they having so done,

her nephew did not take the law of them; but this want of comprehension was set down by her Irish neighbours to the score of English stupidity. The various rumours that these disturbances gave rise to, spread all over the country, and far and near, Pierce was always reminded of his fault by, "Well, Pierce, what's the last!—have you got a new stretcher?" Pierce must have carried his art of exaggeration to great perfection to have attained such note in a country where the practice is so largely indulged in, but circumstances had given him peculiar celebrity, and his aunt had so far succeeded in making him "listen to reason" as to convince his reason that the practice was wrong. The painful part of the matter was, that when he really and truly spoke truth, no one would believe him.

Eliza Byrne more than once was on the point of relenting; but though Pierce swore over and over again that he was an altered man, every exaggeration in the parish was fathered upon him, and poor Eliza did not know what to do for the best. Her brother is certainly Pierce's enemy in the matter, and but for him I really think they would have been married. I wish it was a match, for Pierce Scanlan deserves a reward for fighting, as he has lately done—against a habit, the triumph of which is "never to be believed!" It may be a match! I saw them walking together the last time I was at Artinne; Eliza listening, and Pierce, with very little exaggeration either in his look or manner, making love earnestly yet soberly; the worst symptom I perceived was, that Eliza Byrne shook her head frequently.

"Well, Pierce," I said as we passed them (they had paused for the purpose), "I hope you are weighing your words."

"Bedad! ma'am, I've been truer than standard weights and measures this many a day, but I get no thanks for it."

"But you will, Pierce, in time. The priest, the minister, and aunt Kitty, say you improve."

"I am improved," he said, somewhat proudly, "though Eliza won't believe it. Yet, I know I'm improved."

"Pierce, Pierce!" exclaimed Eliza with a very sly quiet smile, "isn't that a bit of a stretch?"

I think Eliza might venture.

POPULAR INFORMATION ON SCIENCE.

ON THE ORGANS OF THE HUMAN VOICE, AND ESPECIALLY ON SPEECH.

SOME new and philosophical views upon the organs of the human voice, and more especially upon speech, a subject in which every one is interested, having within these few years been published in the Transactions of the Royal Society, by our eminent countryman Sir Charles Bell, we propose to present our readers with a short account of them.

We may announce the general object of the paper in the elegant language of its author: "In contemplating the extent of combination established among the parts of the human body, we become sensible of its perfection above all comparison with things artificial; and this is especially true with regard to the organs of the voice. They are remarkable for their union or co-operation in function; they all perform more than one office, and are interwoven and associated with parts which serve a double, or even a triple function. But we ought not to be surprised at the intricacy of structure in the human organs of voice, when we find them capable of imitating every sound of bird or beast, excelling all instruments of music in clearness or expression, and capable of making those infinite changes on articulate sounds, which form the languages of the different nations of the earth."

The apparatus which we so readily use in speaking, is somewhat complicated. It includes the lungs and chest, and the air-passage from the top of the lungs to the lips, including of course the mouth. The lungs and mouth need not be dwelt upon; but the air-passage must be considered as divided into three parts—the trachea, or windpipe proper, extending upwards from the lungs to the second part—the larynx, regarded generally as the more especial organ of voice, included in that protuberance at the upper part of the neck familiarly known as Adam's apple (*pomum adam*); and, third, the pharynx, or back mouth. A few words must be said on each of these parts.

The trachea, or windpipe proper, has long been described as a tube formed of imperfect little hoops of hard gristle (*cartilage*), joined by membranes at the back part, where it is more soft and flat: thus it is at once a rigid and free tube for breathing or respiration; and it yields in the act of swallowing, permitting the morsel to descend behind it. All this is perfectly correct as far as it goes; but there is a great omission. At the back part of the windpipe, exterior to the lining mucous coat, there is a fine and regular layer of muscular fibres, which run from one end of these hoops to the other. This muscle is beautifully distinct in the horse. When a portion of the trachea is removed from that animal's body, and every thing dissected off but this muscle, the cartilages are preserved in their natural position; but the moment that the muscular fibres are cut across, the cartilages fly open. This muscle, then, in man, and the highest class of animals, is opposed to the elasticity of the cartilages of the trachea; by its action it diminishes the bore or calibre of the tube, and by its relaxation the canal widens of itself. When we take in breath, the whole extent of the air-passages

opens or expands, and then the trachea also is most free; but in breathing out, and especially in forcible expiration and coughing, the trachea is diminished in width. The obvious purpose of this arrangement is to clear the trachea of whatever secretions may be naturally, or whatever foreign bodies may be accidentally, in it. When the air is inspired, the trachea is wide, and the mucus is not urged downwards: when the air is expelled, the transverse muscle is in action, the calibre of the tube is diminished, the mucus occupies a larger proportion of the canal, the air is sent forth with greater force than that with which it was inhaled, and hence the gradual tendency of its contents to ascend. The same principle still more strikingly holds true when a foreign body accidentally gets into the windpipe; the larynx, and upper parts, participate in these movements; and hence unspeakable inconvenience and mischief are avoided.

The view here taken of the use of this part is strengthened by examining the trachea of birds. In them the cartilages are complete hoops, and there are no compressing muscles; but in them, also, the air-tubes are quite dry, and the lungs, and other air-cavities, are also free from moisture.

Another important use of the trachea, more directly considered as the organ of voice, is, that it conveys the air from the lungs to the larynx, very much as the tube or *porte-vent* does in an organ from the bellows to the reed of the organ-pipe; and it is interesting to recognise the precise part it plays in the various exercises of the voice. Our author distinctly informs us that it does not vibrate, or give out sound, and so does not interfere with, or confuse, the more especial function of the larynx. The imperfect circle formed by the many rings of the trachea, and their separation from each other, are ill suited to convey sound. Sir Charles proceeds to point out a still more peculiar provision for effecting this important object. If, says he, in inspecting a musical instrument, we should find a spongy body of the consistence of firm flesh, in contact with a chord or tube, and an apparatus by which this body might be pressed against the vibrating part, it would be concluded that it damped or limited the vibration. Now, precisely such a body is found in man, at the upper part of the trachea, known as the *thyroid gland*—that gland which, so often swelling in some countries, and sometimes in all, forms the well-known and singular disease, the *goitre*. This firm glandular body is overlaid with muscles, whose action braces it to the windpipe. The tendency, therefore, even to a continued drone, from the vibration of the trachea rising above the inflections of the voice, and adding nothing to its distinctness, is anticipated, and the adjustment of the gland to the trachea is the most suitable means of suffocating or preventing the vibration from descending along the sides of the tube. The accuracy of this view is tested and confirmed by an examination of the vocal instrument in birds. Their sounding apparatus, as may be seen even externally, is at the lower extremity of the trachea, and in the cleft; hence the sound must ascend along the whole trachea; and, accordingly, it is interesting to notice that there is no thyroid gland in birds, and the windpipe itself is a firm tube, with cartilages of entire circles; and, in short, there is nothing in them to suffocate the rising vibrations. In no animal is the thyroid gland of the same relative magnitude as in man.

Proceeding to the larynx, we find the common opinion confirmed by experiment and analogy, that the narrow slit of the larynx, the *glottis*, is the primary seat of sound—the source of the vibrations communicated to the air as it is breathed; whilst, at the same time, to consider the motions of the glottis, and even the modulations of the air in the larynx, as the sole source of sound, would be incorrect. The breath which plays inaudibly in respiration, is formed into the voice, or vocalised, when the strings of the glottis, or *chords vocales*, are braced so as to cause the edges of the slit to vibrate in the stream of air. In any wind instrument the air must be impelled with a force sufficient to make the sides of the tube vibrate; so, in the production of sound from the human organs, there must be a certain pressure of the column of air: but in the organs of the voice there is this superiority, that there is not only the means of regulating the pressure by the column of air, but of adjusting the vocal chords so as to suit them to the most delicate issue of the breath. The edge of the glottis is exquisitely regulated by its many muscles, and the motions of the chest by its accustomed play.

The construction of the larynx is not more complicated than it is beautiful. Five gristles, or cartilages, go to form its sides or walls. By far the largest of these gristles is that which projects forward, and is familiar to every one as Adam's apple—the *thyroid cartilage*; below, there is one shaped like a ring, and hence called the *cricoid cartilage*, from the back of which two slender ones stand up, which are very moveable, called the *arytenoid*; and, lying over the glottis, hence called the *epiglottis*, is the fifth, connected with the root of the tongue. Between the thyroid gristle on the fore part, and the arytenoid ones behind, lie the vocal chords, a lower pair, forming the chink of the true glottis, and an upper pair, somewhat higher. These ligaments do not stand distinct from the sides of the tube, but under the lining membrane, which, sinking between the two, forms the *laryngeal sac*. This little sac, or lateral cavity, has much influence on the voice; it holds the chords from the side of the tube, and gives great freedom to their vibration. Its size varies in different animals; and in those monkeys called *howlers*,

remarkable for their horrible piercing cries, it is remarkably large. Sir Charles Bell, an experienced surgeon, as well as an able anatomist, in those sad scenes he so often has been called to witness, has frequently seen these parts in motion in man, both in breathing and speaking. During inspiration the glottis is dilated, and in the vain attempt at utterance moves in correspondence with the lips.

In advancing to the *pharynx*, notwithstanding its higher importance, we come to a part of the subject which has as yet been imperfectly treated, and where the action essential to articulate language has been altogether omitted. Tracing the volume of simple sound in its ascent from the glottis, it should be noted how well calculated the *epiglottis* is to direct that sound forward to the passages above. The soft palate, seen at the back part of the roof of the mouth, hangs immediately above the epiglottis, and being furnished with many muscles, it is rapidly drawn down and furled up. This fold forms the partition between the *mouth*, properly so called, and the back mouth, *arrière bouche* of the French, in other words the *pharynx*; and the whole of the curtain, with the arches of the palate, and the *uvula* (or *pap of the hase*, as it is called in the northern division of the island), vary their condition during the production of simple sounds. So extensive and complete is the action of this fold, that our author states he has seen it completely interrupt the ascent of the breath in that direction which leads to the nose and upper parts of the face. The *pharynx*, then, it will be understood, forms a great irregular bag of a muscular texture, having the glottis opening at its under part, whilst above it is terminated by the posterior nostrils, and by the mouth anteriorly. Considering the passage for the voice as one irregular cavity, extending from the glottis to the lips and nostrils, it is subject to great changes, and powerful in its influence over the voice. For, although the breath is made vocal by the larynx, both the musical notes in singing, and the vowels in speech, are effected by the form and dimensions of this cavity. When the *pharynx* is by accident divided, and the top of the windpipe exposed, no sound issues from the larynx upon the attempt to speak. By great effort a noise may be produced, but any thing like the common effort of speaking is attended with no audible sounds. From this, it is inferred that the delicate vibrations necessary to articulate language, are influenced not merely by the action of the glottis, but by the condition of the walls of the *pharynx*, the cavity into which the sound is thrown. In this part of the air-passage there is a correspondence with the common flute or pipe, in as far as it is lengthened during the grave sounds, and shortened in the acute. Even although the glottis performs the principal part, the *pharynx* lends a very powerful help. It is impossible to see a singer running up the notes to the highest, without admitting there must be a vast influence produced by the alternate shortening and elongation of the *pharynx* and mouth. To allow the cavity to be shortened in the greatest degree, the larynx is raised, and the lips retracted; on the contrary, the trachea descends, and the lips are protruded to lengthen the cavities and give out the lower notes.

We now proceed to the important subject of *articulation or speech*.

In pronouncing the vowels, which are simple continued sounds, and the diphthongs, which are the combination of these open sounds, the *pharynx*, at all times irregular, varies its forms or dimensions without interrupting or cutting the sounds. These sounds are universal and expressive: others are more conventional, and form the constituents of articulate language. It has generally been imagined that the vocalised breath ascending into the mouth, is there divided, and made articulate by the tongue, teeth, and lips, and that this comprehends the whole art of speech. This, however, it would appear, is far from being the case, inasmuch as in articulating or forming the consonants, the *pharynx* is a very principal agent; and this smaller cavity of the *pharynx* is in fact substituted for the larger cavity of the chest, to the immense relief of the speaker, and the incalculable saving of muscular exertion.

The late eminent Dr Thomas Young made a comparison of the power employed by the glass-blower in propelling the air through his tube by the force of his cheeks, and in propelling it by the force of his lungs; and calculating the case with which the lesser cavity (the cheeks) is compressed in comparison of the greater, he concluded that the weight of four pounds would produce an operation through the lesser cavity equal to seventy pounds weighing on the former, or, in other words, it was more than seventeen times easier to work with the lesser cavity than with the greater. The cause of this and many other results which appear paradoxical, is that peculiar quality of fluids by which they transmit pressure equally in all directions; and this wonder-working property, it will be believed, is not disregarded in the scheme of animal structure. When a forcing-pump is let into a reservoir, it produces surprising effects. The piston of the hydraulic press being loaded with the weight of a pound, the same degree of pressure will be transmitted to every part of the surface of the reservoir, equal in magnitude to the base of the piston. A man standing on the hydraulic bellows raises himself by blowing into the tube; and, contrariwise, the weight of his body does not produce from that tube a blast of air superior to the force of the contraction of his cheeks. Before demonstrating the influence of this principle on articulation, it may be exemplified by a familiar instance:—A sailor, leaning his breast over a yard-arm, and exerting every muscle on the rig-

ging, gives a direction to the whole muscular system, and applies the muscles of respiration to the motions of the trunk and arms, by the agency of a small muscle of the windpipe, which, incapable of raising the thousandth part of the weight of his body, and weighing but five grains, yet controls and directs the whole. The explanation is this:—A man preparing for exertion, draws his breath and extends his chest. Were the muscles which expand the chest to continue in exertion to preserve it so, there would be a great expenditure of the vital force. But this is rendered unnecessary by the action of the small muscle which closes the glottis: it shuts the extremity of the windpipe, and has here a power to confine the column of air superior to the united power of all the muscles of the chest and trunk together. However powerful these muscles may be in compressing the chest, their influence is very small on the column of air in the windpipe, their pressure there being no more than on any part of the walls of the chest, which is of the same diameter as the bore of the tube. The closing of the glottis throws all these muscles free to act as muscles of the trunk and arms; but if this little muscle permit the air to escape, these muscles sink with the falling chest; they lose their power as muscles of volition; and, consequently, all powerful efforts cease in an instant. Thus it happens that a muscle of the glottis not weighing the thousandth part of the muscles of the trunk of the body, controls them all; and this it is enabled to do on the principle of the hydraulic press: hence, then, we are prepared to understand the great importance in the animal economy of power being employed in a lesser cavity in preference to a larger, and how much will be saved by the agency necessary in articulation being given by the *pharynx* instead of the greater cavity of the chest.

To return, then, to the *pharynx*. We now know that it is a large cavity behind the palate, formed by a dilatible bag, acted upon by many muscles. We have seen that the sound issues into it from the glottis beneath; and that although it opens into the nose above, yet this passage is closed as with a valve when the curtain (*velum*) is raised; at such a time, if the mouth be also shut, the bag will be closed on all sides, and may then suffer distension by the vocalised breath ascending through the glottis. In speaking, much of the sound, namely, that of the vowels and diphthongs, is the uninterrupted issue of the vocalised breath, modulated and differently directed by the passages, but not checked or interrupted; the consonants are the same sounds checked by the tongue, lips, and teeth; at the moment of this interruption, the *pharynx* being distended, is prepared to give a stroke, or *appulse*, as it is called, by its muscular energy, exactly in time with the parting lips. If we lay the hand upon the throat while speaking, so that the fingers embrace the bag of the *pharynx*, we shall feel that each articulate sound is attended with an action of the *pharynx*, and preceding many of the letters (the explosive) we shall be sensible of the distension of the throat. We may moreover observe, that, while the distended chest falls regularly and uniformly, the *pharynx* is alternately distended and compressed in correspondence with the articulate sounds. We can now understand that, if the appulse of the breath in speaking arose from the action of the chest, it would be attended with great and unnecessary exertion, since in proportion to the size of the reservoir and the smallness of the tube that gives issue, would be the force required on the sides of the reservoir to produce an impulse along the tube. If each consonant or accented syllable required the action of the whole thorax, we should find that a man, instead of being able to deliver an oration of some hours' duration, would be exhausted in a few sentences, like a person who bellows, and both disturbs and pains us with his violence.

After this minute and accurate exposition, we might almost say analysis, of the organs of the voice, Sir Charles proceeds to a learned criticism of that department of the labours of grammarians in which they have attempted to explain the formation of the several letters as divided into mutes and semi-mutes, labials, gutturals, &c.; and after showing that their explanations were necessarily imperfect, owing to their unacquaintance with these physiological details, and that they accounted for all the peculiar sounds by the position of the lips, tongue, and palate only, without reference to the *pharynx*, he offers various suggestions which must tend greatly to facilitate their future investigations. From the same misconception of the actions which combine to form the voice, it appears that the grammarians have not supplied a very clear account of *emphasis* and *accent*. According to the foregoing views, there are two sources of the force with which words are uttered, namely, the chest and *pharynx*. The emphatic delivery of several words or syllables must proceed from the forcible expulsion of the breath by the effort of expiration; but the emphasis on a single syllable, and the forcible enunciation of a letter, on which the clearness and distinctness, and sometimes the meaning of words depend, must be produced by the effort of the *pharynx*.

It is curious to observe how many parts conform, and how many actions must accurately correspond, to produce the simplest sound; and how many additional combinations there must be for the formation of articulate voice. As we may audibly breathe through a trumpet without producing a note of music, so we breathe without the tremor of the glottis to produce not the voice properly so called, but merely a whisper; the vocal chords being strung by the action of their muscles, in correspondence with the forcible expulsion of the breath they vibrate, and this vibration is rever-

berated on the column of air, and thus the breath is vocalised, and vowel-sounds are produced. Thus, too, musical notes are produced by the changes in the force with which the voice is propelled, the degree of tension of the vocal chords, and the modulation or change in the open passages. Nothing is more surprising than the precision with which the notes of the human voice are produced, as when we hear, rising over the sound of the organ, the notes more liquid and distinct, and descending again in notes and half notes, as if each arose from a different pipe, and were struck on a distinct instrument. Yet these falls are consequent on muscular action, which alters the diameter and form of the glottis, and the length and diameter of the *pharynx*. This minute accommodation of action does not merely evince the perfection of the organ, but shows the most surprising command possessed over it: and in this respect the muscular apparatus of the throat does not yield in comparison with that of the eye itself. Struck with the perfection of the human voice in expression and variety, excelling the finest instrument mathematically constructed, we have more still to admire in the production of those conventional sounds which become the instruments of thought, and the source of all we know. In speaking, the voice is much influenced by the varying forms of the open passages, before it is articulated in the mouth; whilst with each motion of the tongue or lips, there is a correspondence in the action of the velum and *pharynx*: so that the compression of the thorax, the adjustment of the larynx and glottis, the motions of the tongue and lips, and the action of the *pharynx* and palate, must all consent before a word be uttered.

One other remark, and we have done. In speaking, the play of the chest is not the same as in the common act of breathing. The midriff, or *diaphragm*, is used less, and the ribs a great deal more. An orator preparing to speak, elevates his chest, whilst the abdomen is drawn flatter; the effect of which is to give more ready play to the elastic parts of the ribs, and the falling of the elevated chest is easy and unembarrassed; whereas, to expel the breath beyond a certain degree, requires great muscular exertion, and makes the act of speaking still more complicated. This whole exposition throws much light on the nature of *stammering*, and on the cure of that distressing infirmity. When we look at the number of parts which must combine in the production of articulate sound, we cannot be surprised that the voice should be defective through derangement of the nervous system. In a person who stammers, the imperfection is obviously in the power of combination, not in the defect of any single part. The stammerer can invariably sing his words without hesitation, or impediment, or spasm; because, in singing, the adjustment of the glottis and the due propulsion, by the elevated chest, are accomplished, and continue uninterruptedly. So is it with many a clergyman whose stammering is most painful in a room, but who, on ascending a pulpit, can deliver a long discourse without a faltering word. A person who stutters experiences no distress in pronouncing the vowels and liquid consonants; and if he study to commence his speech with a vowel-sound, he can generally add to the vibration already begun the proper action of the *pharynx*. Another necessary combination often distresses the stammerer, namely, the action of the expiratory muscles, and that of the muscles of the throat. He wastes his breath so much in his attempts at utterance, that, to produce a sound at all, the ribs must be forcibly compressed. Upon the understanding of these particulars consists the science, often greatly abused by vain and ignorant pretenders, of affording relief in these painful and unfortunate cases.

THE MAIDEN, AN ANCIENT INSTRUMENT OF EXECUTION.

A FAVOURITE theme of gossips' stories in Scotland is the *Maiden*, an instrument of execution very nearly resembling the modern French guillotine, which was in considerable practice during the sixteenth and seventeenth centuries, especially for the punishment of state-offenders. The common tale is, that the Earl of Morton, so eminent as a statesman during the reign of Mary, and who ultimately came to be Regent of Scotland, introduced this instrument from abroad, and was himself—so willed the fates—the first to suffer by it. It does not seem to have been used since the Revolution: when Pennant visited our northern clime in 1772, he found a specimen of the implement, being probably that which had been used in Edinburgh, laid aside as a piece of lumber in a room under the Parliament House. The axe connected with another has long been kept in the town's armoury of Aberdeen. About twenty-five years ago, the machine kept underneath the Parliament House was obtained by the Scottish Antiquarian Society, and placed by them in their hall, or museum, where it still exists, and is open every day to public inspection.

This remarkable engine of death—in all probability the very same which dispatched Morton and many not less eminent men—is a huge ungainly piece of timber-work, about ten feet high, blackened over, and altogether such a thing in look and bearing, as any

one would at a glance presume to have had a terrible history. Two upright beams, about twelve inches apart, connected at top and bottom by cross pieces, form a grooved channel for the rising and falling of the axe—a deep blade, loaded with a vast weight of lead. At four feet from the ground, there is another cross bar, covered deeply with leather, on which the culprit laid his head. A moveable piece, coming down above, enclosed and fixed the neck till the axe had done its duty. The rope used for pulling up and sustaining the axe, was fastened to a trigger placed upon a sloping beam which supports the upright grooved frame, like the hypotenuse of a triangle. On the trigger being moved, the rope of course gave way, and the axe, descending with a force derived from its weight, and the space traversed (about six feet), sheared through the interposed neck, and only stopped on the leather-covered cross bar—the head falling into a basket behind, the hook for suspending which is still fixed in the wood. The body of the criminal is supposed to have been laid along upon a bench or table, the end of which was brought against the two upright beams, at about the same height with the bar for the neck. Of this bench no part has been preserved. It is also to be remarked, that one of the upright beams, having been found greatly decayed, was replaced by another of fresh timber, at the expense of the Society. The upright and sloping beams are fixed on a lying framework, necessary for giving stability to the instrument.

It will be observed from this description that the celebrated invention of Dr Guillotin is in some respects an improvement upon the Scottish Maiden. The axe, in that case, is arrested by no cross beam, but, after shearing through the neck, descends several feet lower. Its lip is also oblique, in order that it may have a surer effect in cutting through what is opposed to its descent. Finally, in connection with the frame-work for the axe, there is a moveable board, on which the culprit is bound upright, and which is then folded down and pushed forward—the forward movement being that which loosens the axe—so that the whole operation is conducted with the greatest possible dispatch and certainty. Hence it is that the average duration of a French execution, from the arrival of the criminal on the scaffold, to his being a headless corpse, is from a minute and a half to two minutes.

Notwithstanding the confidence with which tradition speaks of the introduction of the Maiden into Scotland, the early history of our employment of the instrument must be considered as obscure. Beheading with a sword was a common mode of punishment in the middle ages. It prevailed in Scotland, as well as in other European countries. For example, the gallant Sir John Gordon, who suffered at Aberdeen in 1562 for rebellion, was beheaded with a sword, and cruelly mangled, we are told, by an unskilful executioner. As this was an operation which necessarily depended much on the skill and strength of the man employed in it, we cannot wonder that ingenuity was set to work, in various places, to effect decollation with mechanical accuracy. We have heard of such mechanical contrivances being in use both in Italy and Germany. At Halifax in Yorkshire, from an early period, an instrument exactly like the Scottish Maiden was used, being the only thing of the kind ever employed, as far as we are aware, in England. Whether it was set up there, by Earl Warren, son-in-law of the Conqueror, to punish trespassers on his forest of Hardwick, or in the reign of Henry VII., to repress the depredations suffered by the cloth-tenters who then began to flourish in Halifax, is unsettled by antiquaries: perhaps neither surmise is true. The instrument, however, would appear to have been designed from an early age for a peculiar terror to evil-doers in that district; and the promptitude with which it was put into action became proverbial. By a quaint regulation highly characteristic of our ancestors, when a cow or horse was the piece of property stolen, the animal was caused by means of a rope to pull the trigger, and thus become the proximate executioner of justice upon the offender. By records it is ascertained that twenty-five persons suffered by the Maiden at Halifax in the reign of Elizabeth, and at least twelve between 1623 and 1650, after which it became disused. Pennant, in 1772, saw, at the end of the town, the stone-built platform, about four feet high and thirteen broad, on which the instrument used to do its deadly work.

According to the History of the House of Douglas, the author of which lived in Scotland at the time when Morton suffered, that nobleman had caused the Maiden to be made "after the pattern which he had seen in Halifax in Yorkshire."* This author says nothing which can countenance the now existing story as to Morton having been the first to suffer by the instru-

ment in Scotland. In a manuscript work of inferior authority, entitled "Divine Providences," written in the reign of Charles II., by a clergyman named Fraser, and which is preserved in the Advocates' Library, it is stated that Morton took the pattern of the instrument from one which he saw in Italy during his travels in early life; and it is added, that, from his being the first to suffer by the machine, a popular and not very delicate remark was made, which gave rise to the appellation by which the instrument came to be distinguished. It is also worthy of notice, that Kelly introduces into his collection of proverbs, "He that invented the Maiden, first *hanselled* it." That Morton did introduce the Maiden, is to be considered as likely, since we have the respectable authority of Hume of Godscroft on that point; but that he was not the first to suffer by it, has lately been rendered certain by a paper read before the Scottish Antiquarian Society by the Rev. Dr Lee, one of the ministers of Edinburgh. In this paper, the following excerpt is given from the books of the treasurer of the city of Edinburgh, where it appears under date April 3, 1566: "For bearing dailis and puncheons fra the Blackferis to the Croce with the Gibbet and *Madin*, and awaiting thereon, the day when Thomas Scot was justefit, vijsh. To Andro Gotterson, smyth, for grynding of the *Madin*, vsh." Now, though Morton was one of the most guilty parties in the murder of Rizzio, for which the comparatively humble Thomas Scot was "justefit," this event was fifteen years antecedent to the death of the Regent. In the ensuing August, Andro Gotterson gets five shillings "for grynding of the Widow." Are we to suppose that the *Maiden* and the *Widow* were at this time employed as convertible terms for the same instrument? It is shrewdly remarked, in a clever book just published,* that the story of Morton's being the first to suffer by the Maiden, is "just such an exaggeration as the popular voice most affects. Thus, to the fact that Deacon Brodie suffered by his own improved drop, common fame has added the embellishment that he was the first to prove its efficiency. And thus Dr Joseph-Ignace Guillotin died quietly in his bed, on the 26th of May 1814, aged three score and seven years,† long after it was universally reported and believed that he had perished by the machine which has given to his name an immortality of infamy."

The Earl of Gowrie in 1584 (father of the celebrated conspirator) seems to have been the only man of distinction who suffered by the Maiden between the period of Morton's death and the time of the Civil War. Hanging and burning were the favourite modes of execution during the intermediate age. The instrument appears to have been again brought into use in 1646, when the Scotch Parliament found an opportunity of wreaking their vengeance upon Sir Robert Spottiswood, the distinguished Royalist, who had been taken prisoner at the battle of Philiphaugh. Sir Robert had come to Scotland with a commission from Charles I. as secretary of state: it could not be alleged against him that he had borne arms among the Royalists, unless, as he said, his walking-cane could be so designated. In fact, his only real crime was that of being son to the late Archbishop of St Andrews. Nevertheless, the Estates determined that he should suffer. They were at that time sitting at St Andrews, on account of the plague which raged in Edinburgh, and they determined to have their iniquitous sentence carried into execution in that town, from an idea that the seat of his father's aggrandisement was an appropriate scene for the degradation of their victim. They accordingly issued the following warrant to have the Maiden brought to St Andrews from Dundee, in which town, for some reason unknown, it happened to be at that time.

"Decimo sexto Januarii, 1646—38 die Parl. at St Andrews.—The Estates of Parliament give hereby warrant to transport the Maiden from Dundee to St Androis, and ordains the Magistrates of Dundee to deliver the Maiden to sic as sal be sent from the town of St

Androis for transporting thereof. Quhairanent thir presents sal be ane warrant."

It was accordingly used for the execution of this venerable gentleman—one of those rash and vindictive proceedings which were only expiated in the succeeding reign by the oppressions and persecutions to which the Scottish Presbyterians were in their turn subjected by the Royalists. Two or three other prisoners taken at Philiphaugh were executed by the Maiden.

The next personage who fell a sacrifice to it was the Marquis of Huntly, in 1649. About this period, and for some years later, it was used to execute almost all kinds of criminals. We have observed from a manuscript abridgement of the Books of Justiciary in the Advocates' Library, that even women guilty of child-murder were executed by it. Perhaps it was as a peculiarly ignominious distinction that the Marquis of Montrose, in 1650, was hanged. A return to the disgrace of the rope, in his case, might be looked upon as not the least severe part of a punishment intended to comprehend every possible indignity.

After the Restoration, if less actively employed, the Maiden was still continued in use. It was brought into play at the execution of the Marquis of Argyll, in 1661, as also that of his son the Earl in 1685; the latter, in kneeling to submit his neck to the axe, embraced the instrument in his arms, and said it was the sweetest maiden he had ever kissed. After this time, there occurs no notice of its ever having been again employed.

SNATCHES OF CONTINENTAL RECOLLECTIONS.

THE BELGIAN CURRENCY, AND OTHER MATTERS.

THE money currency of Belgium is not yet of a perfectly uniform character, but is much superior to that of Holland. The Dutch coinage is execrable. With the exception of the handsome ten-guilder and five-guilder gold pieces, which resemble our sovereigns and half-sovereigns, the principal part of the current coin consists of florins or guilders, value twentypence, half and quarter florins, and dubbletjes. These are formed of a base mixture of brass and silver, and being greatly worn, they have the appearance of bad English shillings and sixpences of the old coinage. The dubbletje, which is of the value of two stivers or pence, is a paltry little thing, perfectly smooth on the sides, and with edges almost as sharp as a knife. On account of this sharpness, the dubbletje is often used as a weapon of offence by the Dutch boors in their quarrels with each other; for when held firmly between the knuckles of the closed fist, it is capable of inflicting a slashing wound upon the face of an antagonist.

The notice of this quality in the dubbletje reminds me of an anecdote which was mentioned to me in Holland. On one occasion, many years ago, the inhabitants of a village had assembled for some purpose in the court-house—(every Dutch village, however insignificant, has its court-house or hall for the transaction of public business)—and, as usual at such meetings, their knives, of which each person carried one, were hung round the wall. It was an understood law in these rude assemblages, that no one should touch the knife of another, on pain of an immediate encounter. At the meeting to which I allude, there chanced to be two individuals of very opposite appearance and character. One was a tall and stout man, as his name Sterkus would seem to import, and of a most turbulent disposition. The other, called Jantje, or Little John, was a dwarfish being, active withal, but hunchbacked from an injury in his youth, and distinguished in the district as of a singularly gentle and inoffensive temper. Whether from heedlessness or design, Jantje, in wandering round the hall to examine the display of weapons, touched that which belonged to Sterkus, who, glad of an opportunity of quarrelling, instantly challenged the little fellow to single combat. As the odds were most unequal, all exclaimed against this cruel proposal, and endeavoured to pacify the enraged giant. As for poor Jantje, he expressed concern for his error, and begged to be forgiven. But no; nothing would satisfy Sterkus but an immediate engagement. After a certain time spent in wrangling on the subject, Jantje seemed to pluck up courage, and declared, to the astonishment of all, that he accepted the challenge to single combat. With a spirit flashing from his eyes that no one had previously imagined him to be possessed of, he stood forth and demanded that as he was thus forced to fight, he should have the free choice of the weapons wherewith he was to defend himself. An universal shout of approbation gave him the choice which he desired. Retiring for a moment from the room, he returned, armed with an old shoe in one hand, and a dubbletje in the other. The amazement of all was awakened at this extraordinary kind of preparation, which bore no small resemblance to that of David when he went out to meet Goliath. Jantje, however, felt confident in his choice, and the fight began. A few rounds

* The Book of Bon Accord, or a Guide to the City of Aberdeen. Aberdeen, Lewis Smith. 1839.

† He was even older, if the following interesting notice of him in the Biographie Moderne be true: "Guillotin, a physician at Paris, born at Saintes on the 29th of March 1738, deputy from the tiers-état of Paris to the States-general, lived almost unknown before the Revolution; and what caused him to be chosen a deputy, was, that he had been fixed on to prepare a writing called the Petition of the Six Corporations, which became interesting on account of the effect it produced on the public mind, and the suit commenced by the court of law at Paris against the author, who, after having been summoned to the bar, was carried back in triumph by the people. When appointed a member of the National Assembly, Guillotin attracted attention chiefly by a great gentleness of disposition. On the 1st of December 1789, he made a speech on the penal code, in which a tone of the greatest humanity obtained, and which terminated by a proposal for substituting, as less cruel than the cord, that fatal machine which received his name, and which in the end sacrificed so many victims. In 1790, he again took a part in the discussions on the penal code. Some persons, carried away by the horror this machine has since excited, have considered as a monster one of the gentlest, and, at the same time, most obscure men of the Revolution. Nobody has deplored more bitterly than he the fatal use that has been made of his invention. Those who are acquainted with Guillotin describe him as a clever, cool, reserved man, of unblemished integrity, who in some sort retired from the Revolution when he perceived the course to which it was directed. He is at the present day [1811] one of the best physicians in Paris, and is commissioned by government to direct the discovery of the cow-pox."—*Biographie Moderne*, li. 194.

* History of the House and Race of Douglas and Angus, by Mr David Hume of Godscroft; fourth edition; li. 291.

showed that Jantje had not miscalculated the nature of his tactics. Sterkus attacked him with his large knife, dealing out blows, at every one of which the spectators expected to see poor Jantje annihilated; but the little man used so much dexterity in warding off the blows with the shoe in one hand as his shield, while with the dubbletje in the other, and by a well-timed leap, he cut and scratched his adversary's face in such a manner that the giant, quite exhausted with his vain efforts, and pained with the slashings which the piece of money occasioned, was at last obliged to yield to Jantje. He left the field, his face covered alike with shame and blood, while his triumphant antagonist, comparatively unharmed, was loudly cheered and congratulated by the company, who now declared that his name should ever afterwards be Jantje Kordaat, or Little John the Bold.

Returning, after this digression, to the subject of coinage, it may be observed that the common money currency of Prussia and the smaller states, is nearly as bad as that of Holland. The Frederick d'or of gold, value 16s. 9d., and the double and half Fredericks, are elegant pieces; the silver thaler, value about 3s., is also of respectable appearance; but all the inferior coins, assumed to be silver, are of the same base metal as the Dutch florins. Small bank-notes, bearing to be for a thaler each, are common in the Prussian provinces.

When the stranger enters Belgium, he finds himself in a land of intelligible coins. Some of the Dutch money is still in currency, but the greater part of the coins in circulation are of a new mintage, the head of Leopold being on one side, and the value of the piece marked on the other. The money reckoning is precisely the same as that of France, being by francs and centimes. The new silver coins are half-francs, francs, and five-franc pieces.

The Belgians have likewise adopted the French system of weights and measures. As I do not remember having ever seen this system described by any traveller, I shall here attempt an account of it, culling the main particulars from an intelligent little work which I procured in Brussels, called the "Hand-Book for Belgium."

The French system of weights and measures is established on a principle much more simple and unerring than that in use in England—the former is of universal application, the latter can never be any thing but local. The French unity of length and weight is based on an invariable dimension of the terrestrial globe, which is recognisable in all countries. It is independent of all extrinsic notions, such as gravity and the arbitrary subdivisions of duration, an advantage which the length of a seconds pendulum certainly does not present. The admeasurement, then, of a fourth of the earth's meridian—an ideal circle going round the globe from pole to pole at right angles with the equator—constitutes the basis of the French system. The length of this fourth of the meridian is divided into 10,000,000 parts; a single ten-millionth part is the *metre*, or the unity of long measure. (A metre is equal to 39 English inches.)

A square, measuring on each side 10 metres, forms the *are*, or the unity of the mensuration of surface. (160 ares are equal to one British acre).

A cube, measuring on each of its sides one metre, constitutes the *stère*: used for dry measure.

A cube, measuring on each of its sides the tenth part of a metre, is the unity of volume. A vessel, gauging such a cube, is the unity of liquid measures, and is called the *litre*. (A litre is equal to about a pint and three quarters, or nearly a quart, English measure).

The weight of a cube of water, measuring on each of its sides the 100th part of a metre, is the unity of weight, and is called the *gramme*. A thousand grammes of pure water at its greatest density (about 40 degrees of Fahrenheit's thermometer), are of course equivalent to the litre. (A thousand grammes (a killogramme) weigh about 2½ pounds British).

These unities being often too great or too small for common use, they constitute the basis of new unities on the simple decimal principle. The names of these new unities are formed from Greek and Latin words. If to express multiplication of the original unity, Greek is used; if to express division of the original unity, Latin, or words slightly modified from the Latin, is used. The Greek words are *deca*, for ten, *hecto* a hundred, *kilo* a thousand, and *myria* ten thousand. The Latin words are *deci*, for ten, *cento* a hundred, and *milli* a thousand. These various words are placed before, or prefixed to, the principal unity. Thus, the *decamètre* is equal to ten metres, and the *decimètre* is the tenth part of a metre; the *hectolitre* is equal to 100 litres, and the *centilitre* is the hundredth part of a litre; the *killogramme* is equal to a thousand grammes, and the *milligramme* is the thousandth part of a gramme.

The connection between these weights and measures

will now be clearly seen. The *are* is the square decametre; the *litre* is the cubic decimetre; and the killogramme is the weight of a litre of pure water at its maximum density.

The currency of the country being assimilated by decimal reckoning to the weights and measures, it may be safely averred that the whole world cannot produce a more simple and immutable plan of calculation than that now in use in France and Belgium.

Throughout Holland and Belgium there is established a most rigorous and exact method of registering births, originating, I believe, in the principle in the constitution, that every male citizen is born a soldier, and is liable to be called to arms when he attains a certain age. According to law, every birth, whether of a male or female, must be registered in the town-books within twenty-four hours, under a severe penalty for neglect. No child can be baptised (at least in Holland) until this preliminary has been effected; a certificate of the registration is the clergyman's warrant to baptise. Should the child afterwards die, the name is erased from the roll of births. By this plan of registration, the civic authorities can point out annually whose turn it is to be drafted into the militia, and check every attempt at false assumptions of citizenship. So excellent has been the practice of registration in Holland for a long period of time, that genealogies can with great ease be traced in that country.

There exists in Holland, though I am not aware that the law extends to Belgium, a most annoying set of regulations regarding marriage. A marriage cannot be legally solemnised without the consent of the parents of both parties, or, if the parents be dead, a certificate to that effect must be lodged. It would be difficult to estimate the degree of annoyance caused by these absurd arrangements; in some instances, as I was informed, parties desirous of being married, but who could not fulfil the conditions of the law, have left the country for England, and there been united.

NATURALIST'S LIBRARY—SEALS, &c.

THE twenty-third volume of Mr Lizars's beautiful and most meritorious work, the Naturalist's Library, just published, is chiefly occupied by an account of the Amphibious Carnivora (walrus, seals, &c.), the production of Dr Robert Hamilton of Edinburgh. To this is added an account of the group of Herbivorous Cetacea, including the Manatee (the mermaid of ill-informed observers), the Dugong, &c. The whole treatise is in the highest degree creditable to the series, and to the talents and industry of the writer. Over and above all consideration of its merits as a popular treatise, it presents much new information on the Amphibious Carnivora, and portraits of several species, not formerly depicted. Such a volume, with thirty copper engravings, all (except three) coloured after nature, for six shillings, must be held as one of not the least wonders of this wonder-working age.

Dr Hamilton gives, in conclusion, a view of all that has been reported respecting the supposed great sea-serpent and kraken, creatures which have hitherto made a much greater figure in sailors' tales and newspaper paragraphs, than in the annals of natural history. Our author is inclined to admit that the reports respecting them, though exaggerated and often wrong, are not all destitute of foundation in truth. The kraken he supposes to be an unusually large species of the sepia or cuttle-fish—a sea mollusk, which is authentically known sometimes to reach the great size indicated by a breadth of twelve feet. His account of the Great Sea-Serpent we shall present entire, as a portion of the work likely, while entertaining our readers, to support the few words of praise which we have bestowed upon the whole.

"That much fable and exaggeration have been mixed up with the history of the great sea-serpent, cannot be doubted; still, however, the inquiry recurs, What portion of truth is involved amidst this error?"

We turn, first, to an account of an animal which apparently belonged to this class, which was stranded in the island of Stronsa, one of the Orkneys, in the year 1808, and which was first seen entire, and measured by respectable individuals, and afterwards, when dead and broken in pieces by the violence of the waves, was again examined by many; portions of it being secured, such as the skull, and upper bones of the swimming paws, by Mr Laing, a neighbouring proprietor; and other portions, such as the vertebrae, &c., by being deposited and beautifully preserved in the Royal Museum of the University of Edinburgh, and in the Museum of the Royal College of Surgeons. An able paper on these latter fragments, and on the wreck of the animal, was read by the late Dr Barclay to the Wernerian Society, and will be found in the first volume of its Transactions, to which we refer. We can allow space only for a very short abridgement of these docu-

ments, which, be it remembered, furnish an account of the animal principally after it had been mutilated; and hence we cannot wonder if the original accounts are both imperfect and contradictory. It measured fifty-six feet in length, and twelve in circumference. The head was small, not being a foot in length, from the snout to the first vertebra; the neck was slender, extending to the length of fifteen feet. All the accounts agree in assigning it blow-holes, though they differ as to their precise situation. On the shoulders, something like a bristly mane commenced, which extended to near the extremity of the tail. It had three pairs of fins or paws connected with the body; the anterior were the largest, measuring more than four feet in length, and their extremities were somewhat like toes, partially webbed. Dr Fleming, in his notice of this animal, suggests that these members were probably the remains of pectoral, ventral, and caudal fins. The skin was smooth, without scales, and of a greyish colour; and the flesh appeared like coarse ill-coloured beef. The eye was of the size of the seal's; the throat was too narrow to admit the hand. From the many affidavits proffered by most respectable individuals, as well as from other circumstances narrated, there is no manner of doubt as to the existence of some such animal.

We shall next allude to the unvarnished account recently given, of a great animal which excited considerable astonishment and alarm among the western isles of Scotland. The following extract is taken from a letter of Mr Maclean, the parish minister of Eigg, dated 1809, to Dr Neill, the learned and worthy secretary of the Wernerian Society:—"I saw the animal of which you inquire in June 1808, on the coast of Coll. Rowing along that coast, I observed, at about the distance of half a mile, an object to windward, which gradually excited astonishment. At first view it appeared like a small rock; but knowing that there was no rock in that situation, I fixed my eyes closely upon it. Then I saw it elevated considerably above the level of the sea, and, after a slow movement, distinctly perceived one of its eyes. Alarmed at the unusual appearance and magnitude of the animal, I steered so as to be at no great distance from the shore. When nearly in a line between it and the shore, the monster, directing its head, which still continued above water, towards us, plunged violently under water. Certain that he was in chase of us, we plied hard to get ashore. Just as we leapt out on a rock, and had taken a station as high as we conveniently could, we saw it coming rapidly under water towards the stern of our boat. When within a few yards of it, finding the water shallow, it raised its monstrous head above water, and, by a winding course, got, with apparent difficulty, clear of the creek where our boat lay, and where the monster seemed in danger of being embayed. It continued to move off with its head above water, and with the wind, for about half a mile, before we lost sight of it. Its head was somewhat broad, and of form somewhat oval; its neck somewhat smaller; its shoulders, if I can so term them, considerably broader, and thence it tapered towards the tail, which last it kept pretty low in the water, so that a view of it could not be taken so distinctly as I wished. It had no fins that I could perceive, and seemed to me to move progressively by undulation up and down. Its length I believed to be between seventy and eighty feet. When nearest to me, it did not raise its head wholly above water, so that the neck being under water, I could perceive no shining filaments thereon, if it had any. Its progressive motion under water I took to be very rapid. About the time I saw it, it was seen near the Isle of Canna. The crews of thirteen fishing-boats, I am told, were so much terrified at its appearance, that they, in a body, fled from it to the nearest creek for safety. On the passage from Rum to Canna, the crew of one boat saw it coming towards them, with the wind, and its head high above water. One of the crew pronounced the head as large as a little boat, and its eye as large as a plate. The men were much terrified, but the monster offered them no molestation." Dr Hibbert mentions that the great sea-serpent has occasionally been recognised in the Shetland seas, and specifies one which was seen off the Isle of Stanness, Vaeley Island, and Dunvossness.

We now turn to several instances of the appearance of the sea-serpent which have been witnessed off the coast of America, and we do so by referring first to the Report published by a Committee appointed by the Linnean Society of New England, to collect all the evidence they could obtain on the subject. In the month of August 1817, it was generally reported that a very singular animal of prodigious size had been frequently seen in the harbour of Gloucester, Cape Ann, about thirty miles from Boston. In general appearance it resembled a serpent, and was said to move with astonishing rapidity. It was visible only in calm and bright weather, and floated on the surface of the water, like a number of buoys following each other in a line.

In the report to which we have referred, the affidavits of a great many individuals of unblemished character are collected, which leaves no room to apprehend any thing like deceit. They do not agree in every minute particular, but in regard to its great length, and snake-like form, they are harmonious. The first person who makes deposition, saw it for nearly half an hour, at the distance of two hundred and fifty yards. At

that distance he could not take in the two extremities with his glass. The second witness deposes that he observed a strange marine animal, which he believed to be a serpent: it continued in sight for nearly an hour and a half, and moved through the water with great rapidity, at the rate of a mile in two, or, at most, three minutes. On another occasion, he saw it lying perfectly still, extended on the water, and displaying about fifty feet of its body. The third witness judged it to be between eighty and ninety feet in length, with the head formed somewhat like the rattlesnake, but nearly as large as that of the horse. At one time it showed about fifty distinct portions of its body. The fourth witness saw it open its mouth, which appeared like that of a serpent. Another shot his gun loaded with ball at it, at the distance of thirty feet; when he found the monster immediately turned round, as if intending to approach him, and passed very near the boat. The tenth deposition we shall give somewhat more fully. 'On the 20th of June 1815, my boy informed me of an unusual appearance on the surface of the sea in the Cove. When I viewed it through the glass, I was in a moment satisfied that it was some aquatic animal, with the form, motions, and appearance of which I was not previously acquainted. It was about a quarter of a mile from the shore, and was moving with great rapidity to the southward; it appeared almost thirty feet in length. Presently it turned about, and then displayed a greater length, I suppose at least one hundred feet. It then came towards me very rapidly, and lay entirely still on the surface of the water. His appearance then was like a string of buoys. I saw thirty or forty of these protuberances, or hunches, which were about the size of a barrel. The head appeared six or eight feet long, and tapered off to the size of a horse's head. He then appeared about one hundred and twenty feet long; the body appeared of an uniform size; the colour deep brown. I could not discover any eye, mane, gills, or breathing holes; I did not see any fins or lips.' We add that there are many other depositions equally pointed as to the occurrence of this extraordinary creature, and several letters respecting it; one from the Honourable Lonsom Nash, one of the committee of the Linnean Society, and himself an eye-witness; and another, addressed by a clergyman to Judge Davis, the president of the society. General Humphreys, by whom the affidavits were taken, transmitted a copy of them, and a detail of the whole circumstances, to the late Sir Joseph Banks, in whose library the documents are still preserved.

An animal of similar appearance was again seen in August 1819, off Nahant, Boston, which remained in the neighbourhood for some weeks. When first seen, it was stationary for four hours near the shore, and two hundred persons assembled to view it. Thirteen folds were counted, and the head, which was serpent-shaped, was elevated two feet above the surface. Its eye was remarkably brilliant and glistening. The water was smooth, and the weather calm and serene. When it disappeared, its motion was undulatory, making curves perpendicular to the surface of the water, and giving the appearance of a long moving string of corks. The last notice we have seen of this American animal bears date July 1833. The Boston and New York papers of that date state that the sea-serpent had again appeared off Nahant. 'It was first seen on Saturday afternoon, passing between Egg Rock and the Promontory, winding his way into Lynn Harbour, and again on Sunday morning, heading for South Shores. He was seen by forty or fifty ladies and gentlemen, who insist that they could not have been deceived.'

In connection with the animal thus seen in America, we must not omit the authentic account of a previously undescribed species of serpent, which has a striking resemblance in some of its features to the apocryphal animal on which we are now dwelling. The Boston Society of Natural History has the merit of having first brought this serpent under the notice of zoologists, and the committee who described it, unhesitatingly regarded it as a specimen of one of the young of the great sea-serpent. It was seen and killed in September 1817, near Sandy Bay, between a salt lake and the sea, at no great distance from the shore, and was speedily brought to Boston for the examination of the society. It was a yard long all but half an inch. The contour of the back exhibited its most singular feature, for here was found a waving line, produced by a series of permanent risings, which commenced near the head, and extended, almost without interruption, to the tail; their total number being forty. The body could be bent with the greatest facility in the vertical direction, especially at the undulations, but not without great difficulty laterally. The society applied the name of *Scoliophis Atlanticus*. M. de Blainville, in analysing the various documents which have been published concerning this serpent, remarks—'That a new species of serpent has been discovered in America, which is really very singular, especially as it regards its vertebral column, ribs, and mode of progression, appears certain; but that this small serpent is precisely of the same species as the great marine animal which has appeared off the coast, and whose existence we can scarcely deny, is very doubtful.'

But long before the great sea-serpent was ever suspected of being a visitor of the British isles, or of the New World, it was regarded as a well-known member of the Fauna of Scandinavia. In this connection we will not omit the unquestionably exaggerated statements of the honest missionary Hans Egede, concerning what he tells us he himself witnessed off the coast of Green-

land in the year 1734. After speaking of the mermaid, &c. he adds, 'None of these sea monsters have been seen by us, nor by any of our time that I could hear, save that most dreadful monster which showed itself on the surface of the water off our colony, in 64 degrees north latitude. This monster was of so huge a size, that, coming out of the water, its head reached as high as the main-mast; its body was as bulky as the ship, and three or four times as long. It had a long pointed snout, and spouted like a whale-fish; it had great broad paws; the body seemed covered with shell-work, and the skin was very rugged and uneven. The under part of its body was shaped like an enormous huge serpent; and when it dived again under water, it plunged backwards into the sea, and so raised its tail aloft, which seemed a whole ship's length distant from the bulkiest part of its body.' In the New History of Greenland, our author again speaks of this animal, and informs us that Mr Bing, another of the missionaries, took a drawing of it.

Finally, we subjoin the accounts, older and more recent, given of this animal in what may be called its native retreats. We shall begin with a short abridgement of the information supplied in Pontoppidon's Natural History of Norway:—'Our coast,' says the learned bishop, 'is the only place in Europe visited by this terrible creature. This makes many persons, who are enemies to credulity, entertain doubts about it. I have questioned its existence myself, till that suspicion was removed by full and sufficient evidence from credible and experienced fishermen and sailors, of which there are hundreds who can testify that they have annually seen them. All these persons agree very well in the general description. In all my inquiries, I have scarcely spoken to any intelligent person who was not able to give strong assurances of the existence of this fish; and some of our traders think it a very strange question when they are seriously asked whether there be such a creature; they think it as ridiculous as if the question were put to them whether there be such fish as cod or eel.' After this, a long letter is supplied from Captain L. de Ferry, who was in his boat, with a crew of eight men, when they saw a sea-serpent, which he fired at and wounded. His description very much agrees with that already given, and every particular is authenticated by the affidavits of two of his crew. We are also informed that Governor Berestrap states, that he saw a similar animal a few years before, and drew a sketch of it. Mr Hans Strom, a clergyman, also caused a sketch to be made of one which came under his inspection, and other eye-witnesses are named. The bishop concludes, 'I might mention to the same purpose many more persons of equal credit and reputation.' But we must bring these statements of Pontoppidon to a close with one other short quotation. 'Though it is difficult to ascertain its exact dimensions, yet all who have seen it are unanimous in affirming that it appears to be about six hundred feet long; that it lies in the water in many folds, and there appears like so many hogheads floating in a line, at a considerable distance from each other.'

Again, Sir A. de Capell Brooke makes allusion to this animal in his 'Travels in Norway.' He states that he did not witness it himself, but that the fishermen of Sejerstad stated that it was seen in 1818, in the Fjorden. In July 1819, it made its appearance off Otersund in Norway, and Captain Schilderup stated to Sir Arthur that it was seen daily during the whole month, and continued while the warm weather lasted, as if dosing in the sunbeams. When Captain Schilderup first saw it, he was in a boat at the distance of about two hundred yards, and supposes its length to have been about six hundred feet. The Bishop of Nordland had seen two of them about eight miles from Drontheim; he was not far from them, and considered the largest to be about one hundred feet. Again, in 1822, one of these creatures, reported to be as bulky as a large ox, and about a fourth of an English mile in length, made its appearance off the island of Sorø, near Timmask, and was seen by many of the islanders.

The most recent account of this monster we have noticed, appeared in the public newspapers of Drontheim, in the autumn of 1837, and we confess we cannot regard it as a sheer fabrication:—The Adis of this city contains an account from Tozen of the end of August, which it says was communicated to the editor by a very enlightened and principled man, so that it merits attention, as tending to remove the doubt respecting the existence of the sea-serpent. The account says, that since the beginning of the dog-days, the serpent has been seen at various parts of the coast of that district. One of them seems to have remained constantly during this summer near Storfosen, at the Kergvang Islands. Several fishermen have been so dreadfully alarmed at the sudden appearance of the serpent so near their boats, that they did not know in what direction to escape. The serpent did not attack, but followed the boat for some distance, and the men in their haste so over-exerted themselves, that two were confined to their beds. Very credible persons affirm that the length of the sea-serpent may be taken at six hundred or eight hundred ells, or perhaps more; for when these people were near its head, they could not discern its tail. Its greatest thickness is close to the head. These observations were made very clearly within these few days, amongst others, by a credible, sensible man, who, with his two sons, was on our island where they landed, and where the serpent, after following their boat, swam slowly by.'

With these extracts, and without further comment,

we close our account of the great sea-serpent, only remarking, that till favouring circumstances bring the animal under the examination of naturalists, the satisfaction which is desiderated respecting it is scarcely to be expected."

BIOGRAPHIC SKETCHES.

CHARLES ROLLIN.

CHARLES ROLLIN was born at Paris on the 30th of January 1661. He was the son of a respectable tradesman, a cutler, who gave him the advantage of a good elementary education. The father died, however, while Charles was yet very young, and the latter was under the necessity of devoting himself, for the sake of his widowed mother and his brothers and sisters, to his father's employment. Having already acquired a strong predilection for a life of scholarship and study, young Rollin felt the deepest regret at being compelled to relinquish his favourite hopes, but the evil seemed without remedy; and had accident not intervened to give a new turn to his affairs, Paris would have had the services of a very indifferent cutler for a half century or so, and the world would have lost, for all time to come, the enjoyment of a great historian.

An old Benedictine priest, who was in the habit of performing mass every morning in the church of the White-Mantles, at Paris, observed a boy of pensive and resigned appearance to be extremely regular in his attendance on religious service. For a long time, the priest had no intercourse with the boy, yet felt a most sincere interest in him, on account of conduct so little seen in children of his age. At last the good Benedictine took an opportunity one day, at the conclusion of mass, to accost the young devotee. "My son," said he, "you appear to be an unusually good boy, and I feel that I have a great partiality for you; will you come home with me, that we may become acquainted?" The youth gladly followed the priest, and the pair were soon seated over a comfortable breakfast. "Come, my child," said the Benedictine, at its conclusion, "open your heart to me, and inform me of your name and prospects in life." Charles Rollin speedily acquainted the good father with the particulars of his situation. "After my father died," said he, "my mother said to me, 'Charles, my child, you must learn your father's profession for my sake, and for that of your little brothers and sisters. You must make a sacrifice of your love of learning to duty.' I did so; I began to learn the trade of cutlery, but alas! father, I am not expert at it, and they say I shall never be anything but a sorry workman." The boy shed tears as he spoke. The Benedictine was moved, and exclaimed, "Such worthy inclinations shall not be lost to the world. You shall quit this profession, my poor boy, which suits you so ill. You shall return to your beloved studies; I myself will place you at the College of Plessis."

The priest was as good as his word, and the young devotee of the White-Mantles was ere long provided with a bursary at the College of Plessis, then one of the most learned establishments in France. Charles Rollin now found himself in his element, and rapidly rose to a prominent position among the numerous pupils of the seminary. He here formed a strong intimacy with the sons of M. Pelletier, then minister of the country; a connection which endured, with great benefit and pleasure to all parties, for many succeeding years. The minister had young Rollin introduced to him; and observing his uncommon talents and excellent dispositions, made him the companion and partner of the young Pelletiers, not only in their studies, but in their recreations. A source of the most unalloyed pride and satisfaction it was to the widowed mother of Charles, when the latter first came to her door in a splendid carriage, accompanied by the statesman's two sons, with whom he had been spending a portion of the holidays, and whom he had now brought to pass a day beneath his mother's humble roof. It is related, that when the cutler's widow beheld her Charles spring from the carriage before his companions, she felt scandalised at the want of deference which such an act manifested towards the minister's sons. She held her peace, nevertheless, and, after embracing her boy, invited his companions to enter, with great respect. The youths partook heartily of the meal of fruits and milk set before them, laughed, sang, and were as merry as possible. When the carriage came again to the door to take them away, Charles Rollin was about to enter it first, when his mother, who could not brook this second breach of due respect, exclaimed, "Shame, Charles! You were the first to leave the carriage, and you are the first to enter it, as if it were your own." "My dear madam," said one of the young Pelletiers, "you must not scold Charles. He is the head of our class, and must have the first place every where by right."

After perfecting himself in the study of letters and philosophy, Rollin dedicated three years to the study of theology at the college of the Sorbonne, and thus added strength to the devotional feelings for which he was always remarkable, although he did not enter the priesthood. He was not long, however, in attaining a fitting position in life. In the same college in which he had been brought up on charity, a professorship fell vacant when he had reached the age of twenty-two, and the retiring professor pointed him out as a fit successor to himself. Rollin received this appointment in the year 1683, and held it till 1687, when he was removed to the chair of rhetoric. In the succeeding year, he was raised to one of the highest literary professorships in

France, being nominated to the chair of eloquence in the Royal College.

This lofty position, to which the son of the humble cutler's widow had attained solely by the display of merit and industry, was not disgraced by its new possessor. Rollin consecrated himself to the youth of his country; they became his family, his glory, his pride. The duties of his office did not bound his exertions in their favour. He was an universal teacher; and as he himself had been first aided by the accidental notice of the good Benedictine, so did he become in turn the liberal patron of struggling talent. The university with which he was connected owed to him many salutary reforms, among the most important of which may be ranked his revival of the use of the French tongue in the colleges, where it had fallen almost into desuetude, to the great discouragement of native literature. Rollin, in his prelections, displayed the beauty of the masterpieces of eloquence and poesy in the maternal language, and thus did a service to his country, which was powerfully and beneficially felt in the labours of the ensuing generation. The taste for Greek, also, had become almost obsolete, when Rollin lent his aid in reviving the study of the tongue. He had an opportunity of introducing many more reforms into the collegiate system, when he was appointed rector of his university, which took place in 1694. This elevation, an extraordinary one for a young man of thirty-three years of age, shows the eminence to which he had arrived in the estimation of the public and his brethren.

While actively fulfilling his rectorial duties, visiting colleges, and instituting reforms that were long felt in France, Rollin, from this time forward, began to devote much of his life to study. "Watching by day with paternal care over the youth of France committed to his charge, he spent his nights," says a French author, "in writing works for them. And what works! At once the most simple and the most learned, the most instructive and the most amusing, that ever, perhaps, were composed! In these books you have the thoughts and reflections of a great and enlightened mind, combined with all the fervour and energy of a good master, writing for his scholars." Allusion is here made to Rollin's *Treatise on Education*, and to his historical works; but it is proper to observe that the first of his productions did not appear till 1715, previous to which time the subject of our memoir had for a number of years filled another important situation connected with the instruction of youth, in addition to those already held by him. He was appointed colleague to another man of learning in the principalship of the college of Beauvais. This appointment but extended the sphere of Rollin's exertions, and consequently of his utility. It was in 1715 that Rollin's first published work of any consequence, an edition of Quinctilian, with a valuable preface and notes, came from the press. In the same year, he was selected by the Royal College to draw up a reply to the Regent of France, in acknowledgment of favours received by the college at the hands of the regency. The discourse pronounced by the subject of our memoir on this occasion, was some time afterwards thrown into an extended form, and published under the title of a *Treatise on Education* or study. This work contained the fruits of his experience in teaching, and was highly praised. One attack, indeed, was made upon its doctrines; but the objections were soon forgotten, and would not have been mentioned here but for the honourable fact that Rollin, when the author of that critique was disgraced by the court, made him an offer of his purse and every possible assistance in that season of adversity.

The great work on *Ancient History*, which is to this day perused by almost every adult who can read, came next from the pen of Rollin. It appeared originally in thirteen volumes, all of which were given to the world between the years 1730 and 1738. Few works have obtained a more extensive reputation than this, which filled up a great gap existing up to that period in historical literature, and filled it up in such a way that it remains till this hour the standard work on the subject. Considering the immense amount of learning, labour, and research, requisite for the production of a view of the whole world's history, during a period of four thousand years, we must allow, that, had Rollin done nothing but this in his entire life, his claim on the gratitude of mankind would have been strong and incontrovertible. The *Ancient History* spread rapidly over Europe, and several foreign princes expressed their thanks in a direct manner to the author. Among others, Frederick the Great, then prince-royal of Prussia, entered into correspondence with Rollin. This epistolary intercourse continued until Frederick ascended the throne, when Rollin closed it in a manner characteristically delicate and modest. "I respect too much," said he, "the great duties of a sovereign to his people, to intrude, as heretofore, on your majesty's time, and will confine in future the expression of my profound respect to the transmission of my humble works." In France, the *History* of Rollin has ever been a subject of pride, both to the writer's contemporaries and to the succeeding generation. Alluding to the uncommon purity of his language, and the general charm of his style, Montesquieu called Rollin "the bee of France;" and Chateaubriand has warmly praised him, for the virtuous spirit which pervades the work from its commencement to the close. Most impartial persons at the present day, however, will be inclined to admit, that the devotional spirit of Rollin has led him to moralise much more largely and more frequently than was consistent

with the nature of his task, or was likely to be beneficial.

Soon after the publication of his *Ancient History*, Rollin resolved to prepare a work on the *History of Rome*; but he had only finished the first five books, when his death took place (September 3, 1741), to the universal regret of the world of letters, which had fondly hoped that he would live to perfect his historical epitome. The minor works of Rollin were afterwards published, consisting of *Letters*, *Discourses* in Latin and French, and *Poetical Pieces* in Latin. We have now enumerated all the printed works of Rollin. If some readers be inclined to think their amount trifling, let these individuals turn to Gibbon and other historians, and they will at once discover the cause to lie in the vastness of the toil and research requisite to produce great original works of a historical nature, where the consultation and comparison of authorities are tasks for a lifetime.

In his private character as a man, Rollin was the same simple earnest being that he was in boyhood. His humble origin he never forgot, and this led him incessantly to seek out the poor and friendless lovers of learning, and to help them onwards on their path. His frugality gave him the means of doing this, although his disinterested desire for the advancement of learning induced him to refrain from taking even the just emoluments of his various offices, and kept his income always on a low scale. He would not even appropriate any of the profits derived from the sale of his works, but, on the contrary, entered into one sole condition with his publisher, that the latter should permit the author to reimburse him in full, if the productions were unsuccessful—thus binding himself to take all the risk, while he would take none of the profits. This excessive self-denial exhibited itself in all points of his domestic economy. In his little house on the summit of Mount St Genevieve, he employed till the day of his death the same furniture which had been used by his mother. The principal of the university sat upon the same chair which had served the poor cutler's son. In his small garden, planted with cabbage, Rollin received the visits of the greatest men of the day, statesmen, warriors, nobles, and philosophers, the poets Boileau and Racine, Rousseau, and other illustrious names. Loaded with testimonies of esteem and love from such men as these, and enjoying a calm cheerfulness of spirits that flowed from a pure conscience, Rollin, at the age of eighty, sank gently into the tomb. The house where he lived so long, and which was honoured by the presence of so many famous personages, is now, as a recent French writer tells us, the residence of a gardener; and the room which was the study of Rollin, and where he composed his great historical work, is at this moment a stable. "But what of this?" says the narrator of these facts; "the glory of the man is not confined within four walls; it has the world for a dwelling, men for its judges, and all ages to bestow on it the meed of applause!"

CONSUMPTION OF TOBACCO IN THE UNITED STATES.

It appears, from official documents published by the government of the United States, that a surprising increase of the use of tobacco has taken place in that country, and that the annual consumption now amounts to upwards of one hundred millions of pounds. Estimating the population of that country at 14,300,000, which is near the truth, this will give seven pounds for every man, woman, and child. The sum annually paid by the consumers of this quantity of tobacco in its manufactured state, has been computed, by a writer in the *Portsmouth Journal*, an American paper, at twenty millions of dollars.

The following passage is extracted from Dr Mussey's *Essay on the Influence of Tobacco on Life and Health*:—"Eighty thousand dollars' worth of cigars, it was estimated, were consumed in the city of New York in 1810; at that rate the present annual consumption would amount to more than 200,000 dollars. Dr Abbot, in his 'Letters from Cuba,' in 1828, states that the consumption of tobacco in that island is immense. The Rev. Mr Ingersoll, who passed the winter of 1832-3 in Havana (the capital of Cuba), expresses his belief that this is not an overstatement. He says, 'Call the population 120,000; say one-half are smokers; this, at a bit (that is, 12½ cents) a-day, would make between 7000 and 8000 dollars. But this is too low an estimate, since not men only, but women and children, smoke, and many at a large expense.' He says that 'the free negro of Cuba appropriates a bit, or 12½ cents, of his daily wages, to increase the cloud of smoke that rises from the city and the country.' This, in thirty years, would amount to 7058 dollars, a respectable estate for a negro, or even a white man.

The Rev. O. Fowler, from considerable attention to the statistics of tobacco consumption in the United States, estimates the annual cost at 10,000,000 dollars; time lost by the use of it, at 12,000,000 dollars; and pauper tax which it occasions, at 3,000,000 dollars.

This estimate I believe to be considerably below the truth. It has been calculated that the consumption of tobacco in this country (United States) is eight times as great as in France, and three times as great as in England, in proportion to the population."

So far Dr Mussey goes; but the editor of the *New York Commercial Advertiser* goes much farther. He says that about one-third of the whole population, that is, 100,000 citizens of New York, are smokers; and that the average cost to each smoker is computed to be ten cents per day; the total daily cost is therefore 10,000 dollars, and the total annual cost 3,650,000 dollars. The annual cost of bread for the inhabitants of the city, allowing thirteen ounces of that necessary commodity for each person per day, computing flour at ten dollars per barrel, would

amount to 3,493,050 dollars per annum. "Thus," says he, "a little attention to the subject discloses the painful and disgusting fact, that, in the clear-headed, sharp-sighted, money-making city of New York, the inhabitants pay more for tobacco than they do for bread." The estimate of this writer is undoubtedly an exaggeration; but taking all the foregoing statements together, they sufficiently prove that the use of tobacco in the United States is carried to a most irrational excess.

DOSING AND DRUGGING.

MANY seem to suppose that the occasional use of medicine, even in large doses, as an emetic or a cathartic, cannot do much harm. Nay, some suppose we are the better for it afterwards; that health and long life are promoted by it. And as for small doses, taken day after day, as small doses of pica, or bitters, or sulphur, or Dover's powders, or ipecac, these cannot possibly do any harm!

Such views as these are mistaken ones, and they produce a great deal of mischief. The occasional swallowing of emetics and cathartics is hurtful enough; perhaps much more so than any body has as yet supposed. Those who are enslaved to their use—whether yearly, quarterly, or monthly—seldom if ever enjoy any thing like perfect health. Such dosing is at best a short and lazy way of doing that which ought to be done more slowly, by means of proper exercise, cleanliness, temperance, &c. People who resort to it may tell us, as many do, how healthy they are, especially soon after the dosing is over; but they are apt soon to be ill again. And when so, there is usually a stronger demand for a second dose than there was for the first. The truth is, that though the system, like a bow which has been long bent, has a tendency to react after the oppression of a strong and powerful dose of medicine is over, there is seldom any permanent good done. There is indeed present relief; but unless the medicine has been used with great skill and care, and is followed up by other health-restoring measures, as proper air and diet, and cheerful exercise, the system is probably injured rather than benefited.

And yet, how great soever may be the injury done by occasional large doses of medicine, the evil tendency of small doses, habitually taken, is incomparably greater. We believe, most fully, that small doses of medicine—of every kind which irritates or poisons—affect the constitution much more, in proportion to their quality, than large ones. We will give, in a few words as possible, our reasons.

When a large dose of medicine, say a pint of brandy, or twenty grains of calomel, is taken into the stomach, it usually meets with so much resistance, that it is speedily thrown off, either by vomiting or otherwise. The whole vital domain—all the vital organs, we mean—as if aware of its danger, seems to brace itself against it; and if only a part of it finds its way into the circulation, there is such a terrible commotion produced within, that it is very soon ejected from the system, at least the greater part of it. Whereas, when we divide either of these quantities—say the calomel—into twenty doses or portions, and only take two of these small doses a-day, it will not usually require the whole of the twenty grains to poison the system very effectually. That troublesome affection called pyralism, or salivation, will probably manifest itself long before ten days have passed away.

So is it in regard to the exhibition of most other active medicines. If the object be to make a local or transient, rather than a general or permanent impression on the system, single large doses are administered; but if, on the contrary, our object is to affect, that is, poison the system, single large doses are administered regularly and daily. In the latter case, they seem to find their way unperceived into the circulation, and into every nook and corner of the system, bringing it by stealth, as it were, under their influence.

And those persons who use large doses of alcohol, or powerful emetics, cathartics, &c., only once a-month, once in two months, or once in a quarter, and abstain from them entirely the rest of the time, though they unquestionably thereby shorten their lives, will greatly out-last those who take small doses daily, even if the aggregate of those small doses should not half equal that of the large ones. We might cite particular cases in proof of this point, but the world is full of them. Besides, the principle we are here laying down will come up again presently.

If what we have said thus far is true—if all medicine, even when given by the physician, if not given with the utmost skill and caution, should be regarded as shortening life—if the daily habit of dosing is so pernicious, and especially if the smaller the dose the greater the injury, in proportion to its quantity, how careful ought we to be to take no medicine except when driven to the absolute necessity of doing so, and only by and with the advice of the most skilful physician! Should there remain any doubt on this point, we think it will be the following consideration.

The daily use of medicinal substances is usually attended with a production of many serious evils.

1. The taking of one dose makes the way to another more easy. He who has found temporary relief from pain in the use of a dose of laudanum to-day, will be very likely, on the recurrence of similar feelings, to take another dose, especially if he has it at hand. The third dose will be taken still more readily, the fourth more so still, and so on. Again, what cures repeated returns of colic, or any other complaint, will be used by and bye for relief in other complaints; and what cures a

more severe pain to-day, will of course be expected to cure one less severe to-morrow. Further still, what cures all sorts of disease so well after it has actually arisen, will be confided in, ere long, to prevent it.

But as one dose taken to prevent pain is likely to awaken troublesome feelings at some future time, nothing is more probable than that he who has once begun the habit of dosing and drugging will at length become confirmed in it. It is in vain to tell the person who has acquired the habit of dosing, that this is the fact, that every dose of every medicinal substance he takes, from the weakest herb tea to opium or prussic acid, though it relieves present pain, by benumbing the nerves or otherwise, only increases the severity of future attacks. He cannot, he will not believe you. He is cured for the present, and that is enough for him.

2. The daily use of medicine, in small doses, not only aggravates the complaints for which it is taken, but also invites new diseases. It is in the system, especially in the fluids, almost like leaven in the mass with which we are accustomed to incorporate it. It is, at least, like seed sown on a prepared soil, ready to spring up and bring forth, in new complaints, some thirty, some sixty, and some a hundred fold.

3. The daily use of medicine of every kind, and in every degree, not only tends to form and fix the habit of dosing, to invite diseases, and to aggravate those which are induced by other causes, but it also puts the system in such a condition that we shall hardly be apt to receive benefit from the administration of medicine when we are really sick, and its use seems fairly indicated.—*From an American publication entitled "The Library of Health."*

THE WALTZING BEAR.

In the end of the year 1837, a scene took place at Czerny in Bohemia, which might be remembered with advantage at this particular period in Britain, where there is a growing passion for the exhibition of wild beasts on public stages. A Bohemian manager of a theatre having heard of the immense success attending representations where real dogs, elephants, monkeys, &c. were introduced, bethought himself of trying to turn a bear to account in his own dramatic temple. Accordingly, he got his literary assistant to compose a little melodrama, in which all was made subservient to the operations of a trained bear, which the manager had got hold of. The plot ran thus:—A dethroned king having fled to the mountains, fell in with a bear that had been wounded by the hunters. Androcles-like, the monarch relieved the bear of its pain, and thus acquired its warmest gratitude. The feats of agility performed by the bear, several dances by him and by savages, or rather peasants, with a due allowance of thunder and particoloured flames, formed the leading attractions of the piece. It was beyond measure successful. Every body admired the docility of Bruin, his agility in climbing, and his grace in a closing waltz with a young peasant girl. After a run of several nights, however, the bear seemed on one evening disinclined to his work. The star of the night—Ursa Major—appeared desirous to withdraw its light. But by dint of energetic remonstrances at the side-scene, he was got to move on till the appointed time for the waltz. He stood up with his fair partner, and began to advance and retreat very elegantly. The audience were in raptures. They stood up on the seats to see more perfectly. All at once a shriek burst from the stage. All who were upon it fled, and the first to be off was the partner of the bear. The spectators were not alarmed at first at this, thinking it a part of the unusual performance; but they speedily saw their error when the bear turned round and moved forward to the front of the stage, with the muzzle, which formed the wonted protection against his freaks, hanging loose from his neck! Off went the musicians in one instant, and off the shrieking audience tried to go also. The crush was terrible. Many were trampled down and seriously hurt. At length all the lower part of the theatre was cleared without any injury inflicted by Bruin, who continued, meanwhile, to the unspeakable horror of those who were hindmost in the crush, to cross from the stage to the pit benches. There he lay quietly down to sleep, and there he was quietly muzzled some time afterwards by his keepers.

On account of the alarm and contusions received on this occasion, the authorities interfered, and the Great Bear never starred it again in the theatre of Czerny.—*French newspaper.*

BREAKING A BUTTERFLY UPON THE WHEEL.

In the republic of Quito, and some other parts of South America, there is a small insect called the *comejen*, whose destructive qualities are so active, that in the space of one night it will penetrate the hardest wood, or any other similar substance. In that short period it has been known to penetrate, through and through, a bale of paper containing sixteen reams. The insect builds its nest under the eaves of the houses, of a glutinous clay, similar to that used by the swallows in the fabrication of their nests; but the *comejen* continues his for several yards in length. The natives sometimes daub their nests with tar, which is sufficient to disperse the whole swarm; for, if disturbed, they will divide into different societies, and each will separately search for a convenient place in which to form a settlement.

In the archives of Quito there is a curious royal decree of Carlos III. respecting this insect. A number of cases of gun-flints had been sent to Panama from Spain, for the purpose of being forwarded to Lima; but their non-arrival at this place caused the viceroy to repeat his request to the court for the necessary supply. This gave rise to an investigation—the flints were traced to Panama, and the governor was ordered to account for them. In his answer to the minister he stated that the *comejen* had destroyed the cases in the royal magazine. The

minister being ignorant of what the *comejen* was, an order was issued under the royal seal, commanding the governor of Panama to apprehend the *comejen*, to form a summary process on the crimes which he had committed, then to send the prisoner and documents, with the necessary guard, in custody to Spain, that he might be dealt with according to the extent of his criminality!

THE DYING STUDENT.

A sickening weight is on my heart—I feel
The current of my life is ebbing fast.
Hark! from the minster comes its midnight peal—
When next it sounds, my sorrows shall have past!
The chillness of the grave already clings
About my limbs, and uncouth shapes of fear
Throng up around me, and on ebon wings
Death's dull-eyed king himself is hovering near.

Was it for this I curbed the lightsome play
Of youth's high passions, its unburdened mind?
Was it for this I flung its joys away,
And with the throes of wild ambition pined?
Why did I learning's volumed stores unclasp,
Why with rack'd brow pursue the chase for truth,
To see it ever fly my toilsome grasp,
Myself grown old amidst my wreck of youth?

A creeping stillness fills my lonely room,
No voice, no hand its palm in mine to place!
Vainly I strive amid the deepening gloom
To catch the light of one familiar face.
Visions there are, that hover by my side,
Strewing my restless pillow with annoy,
My father weeping for his hope, his pride,
My mother waiting for her dark-haired boy.

My sister, my sweet sister's clear glad voice,
As last I heard it fill the sunny air,
Is sounding near—and she, my bosom's choice,
The hallowed idol of my soul, is there.
And yet, mayhap, this very hour, her heart
Bounds to the music of its own delight,
Framing new joys in which I bear a part,
Joys all, alas, too fair and overbright!

Oh, might I dream away into my rest,
Might lay my fevered temples all thrown bare
To sleep upon her gently heaving breast,
And shade them with her folds of clustering hair!
To feel her arms about my neck, her kiss
Warming my clay-cold cheek; to catch her breath
Whispering kind words, meet for a time like this,
Might scare the horror of this drowsy death.

But I am here alone—all, all alone,
None near that loves me, none that I can prize;
Strange voices o'er my tuneless sleep shall moan,
And strangers' loveless hands shall close mine eyes.
How drear and dark it grows! My foot on lamp
Burns yet a little while: 'twill soon be over—
What means this shuddering dread, these dewy so damp,
This chill all here about my heart! No more!—

STATISTICS.

The following whimsical answers are said to have been returned to a set of queries recently issued under a Commission of Inquiry in Ireland:—

Qn.—How many labourers are there in your parish; how many in constant, how many in occasional employment; how are they maintained when out of employment?

Those who can get work, will work if they can,
Those who can't, beg or steal—that, sir, is the plan.
What is the ordinary diet, and condition with respect to clothing, of the labouring classes?
The general diet is potatoes and *point*,
For seldom, if ever, they see any joint.
Their clothing is various, as every foot knows,
Some decent, some ragged, without any hose.

At what periods of the year are they least employed?
What tiresome questions! if ever I knew
Such a big set of asses! Why, when they have nothing to do!

What, on the whole, might an average labourer, obtaining an average amount of employment, earn in the year?
Do you think with such questions my mind I'd perplex,
Or trouble my head, or my intellect vex?
For an average man—was there ever such stuff?—
An average nothing, would be full enough.

What would be the yearly expense of food for an able-bodied labourer in full work?

And now for this question! to answer it right,
I will send you a man with a fair appetite:
You can feed him a quarter, and judge pretty near
What would be a just average during the year.

Of what class of persons generally are the landlords of cottages or cabins?

Some taller, some shorter, some black, brown, or fair;
Some squint-eyed, some crook-nosed, and some very quare.

What is the usual rent of cabins with and without land?

From one to two pounds they will promise to pay,
But the landlord is glad, after two years, to say,
"I'll forgive you the rent, if you'll give up the key."
He then gets another: who acts the same way.

Of what description of buildings are those cabins, and how furnished? Are they supplied with bedsteads and comfortable bedding?

A cabin consists of the walls, roof, and floor,
With sometimes a window, and mostly a door.
Their beds are of straw, and instead of a rug,
"A slip of a pig" just keeps their feet snug.

Upon what terms are herds usually hired in your parish?

No flocks in the field, and no herd in the stall,
For herdsmen there surely can be little call.
—*Athenaeum.*

A MARTYR TO SCIENCE.

AFTER Franklin made his great discovery of the identity of lightning and electricity, by means of a kite sent up into the air during a thunder-storm, many philosophers eagerly sought to repeat his experiments. Amongst these Professor Richman of St Petersburg was the most indefatigable and fearless. In pursuing a series of experiments on atmospheric electricity, he erected what was called a gnomon, which consisted principally of a Leyden jar, communicating with an iron rod, which rose some feet above the roof of his house; and an electrometer, consisting of a linen thread with half a grain of lead tied to it. Of course, when the gnomon was charged with electricity, and had communicated that fluid to the thread and the metal, the latter, being easily moved, would be repelled from the gnomon; and its angular ascent on the face of a divided quadrant or index indicated the force of the electricity which had been accumulated. On the 9th of August 1752, Richman obtained from the end of the rod electrical flashes, which could be heard at several feet distant; and if any person touched the apparatus, a smart shock was felt.

On the 6th of August 1753, the professor, whilst at a meeting of the Academy of Sciences, heard the sounds of distant thunder; and having previously made every arrangement for making experiments, he instantly quitted the assembly, taking with him his engineer, Mr Sokolow, to make draughts of whatever might appear interesting in the phenomena. On their arrival at Richman's house, the plummet of the electrometer was found elevated four degrees from the perpendicular; in other words, the electricity in the gnomon had accumulated to such an extent, that it repelled the lead to the distance mentioned. Whilst the philosopher was in the act of describing to his companion the dangerous consequences which might follow if the thread rose to forty-five degrees, a tremendous crash of thunder shook the imperial city. He bent his head over the gnomon to observe the indications of the electrometer, and in this position, with his head a foot from the iron rod, a globe of bluish-white fire, about the size of Mr Sokolow's fist, shot from the iron rod to the professor's head, accompanied by a report as loud as that of a pistol. The discharge proved fatal; he fell back on a chest, and expired in a moment. Sokolow was stupified and benumbed by a kind of vapour which had been generated, and his clothes were covered with burnt marks produced by the red-hot fragments of a metallic wire which had struck his person. On recovering himself, he rushed out of the house, and made known the terrible disaster which had taken place. In the meanwhile, Madam Richman, alarmed by the thunder-stroke, hastened to the chamber, and found her lifeless husband in the attitude of sitting upon the chest, and leaning against the wall.

The medical part of the case is not without interest. Aid was of course instantly obtained; a vein was opened, but no blood flowed from it; and although every attempt was made to restore life by violent friction and other means, all was in vain. When the body was turned, a small quantity of blood dropped from the mouth, and from a red spot which marked the forehead a few drops also oozed out. Several red and blue spots, not unlike leather shrunk by burning, were discovered on different parts of the body. The shoe of the left foot was burst open, and a blue mark appeared on the foot beneath the aperture. The stocking exhibited no corresponding hole, and the coat had been uninjured. On opening the body, neither the brain nor the cranium showed any appearance of injury; a little blood appeared in the cavities below the lungs, and in the lungs towards the back, which were of a dark-brown colour. The heart-glands and smaller intestines were all inflamed, but the entrails were of the natural appearance. Some silver in one of the pockets remained uninjured by the electric fluid. Immediately after the fatal explosion, the house was filled with a sulphureous vapour. A clock was stopped in the adjoining room; the ashes of the hearth were strewn about; the door of the room was rent asunder, and a part of the door itself was torn off. The Leyden jar was shattered, and its metallic filings were scattered about the apartment.

PUNCTUALITY OF WASHINGTON.

When Washington appointed noon as the hour at which he should meet Congress, he never failed to be passing the threshold of the hall just as the clock was striking twelve. Whether his guests were present or not, he always commenced dinner exactly at four. Not unfrequently, new members of Congress, who were invited to dine with him, delayed until the meal was half over; and he would then remark, "Gentlemen, we are punctual here. My cook never asks whether the company has arrived, but whether the hour has." When he visited Boston in 1789, he appointed eight A.M. as the hour when he should set out for Salem (a town of Massachusetts); and while the old south clock was striking eight, he was in the act of mounting his horse. The company of cavalry which volunteered to escort him, were parading in a neighbouring street after his departure, and it was not till the general reached a place at several miles' distance that they overtook him. On the arrival of the corps, Washington in a perfectly good-humoured manner observed, "Major —, I thought you had been too long in my family not to know when it was eight o'clock." Captain Pease, the originator of the stage establishment in the United States, had a beautiful pair of horses which he wished to dispose of to the general, whom he knew to be an excellent judge of horses. The general appointed five o'clock in the morning to examine them. But the captain did not arrive with the horses until a quarter past five, when he was informed by the groom that the general had been there at five, and was now busy fulfilling other engagements. Pease, much mortified, was obliged to wait a week for another opportunity, merely from having delayed the first quarter of an hour.

PRICE THREE HALFPENCE.

ANDREW ANDERSON.

RATHER more than ninety years ago, there resided, in the town of Elgin, in the north of Scotland, a young woman named Marjory Gilzean. She was the child of decent parents, and possessed considerable personal attractions. About the time of the rebellion of 1745-6, a foot-regiment was quartered in Elgin; and in this regiment there was a private soldier named Anderson, a native of a neighbouring parish, who had recently been enlisted, and who became deeply smitten with love for Marjory Gilzean. She listened to his suit, and when the regiment was removed, she left the town in his company, but not till a private marriage had taken place, though the contrary was believed at the time. Of her history in connection with the regiment, nothing is certainly known. That her husband was sent abroad, while she was forced to remain behind—that he was killed in battle—and that he used her harshly, and cast her off—were various rumours, grounded probably on little more than mere surmise. Certain it is that, in or soon after the year 1747, she returned to Elgin, in an emaciated and distressed state, unsettled in her mind, and carrying a baby in her arms. Her parents, who, even though they could have been convinced of her having been married to the soldier, would still have regarded her as one who had brought discredit upon them, did not receive her in a forgiving spirit. Neither did the other persons who had known her in her better days like to show any countenance to one whom they believed to have been little, if any thing, better than a wanton. The reception she met with, and the wild fancies of a wandering mind, induced her to take a strange step. Close beside the burgh are the yet majestic remains of an ancient Cathedral, the area and precincts of which have continued since the Reformation to be used as a burying-ground. Amidst these crumbling ruins there is one chamber still entire, a small cellar-like room, about five feet square, with scarcely any light, and which is said, in ancient times, to have been the Sacristy, or place for keeping the vessels used in the offices of religion. Here the poor outcast took up her abode, rendered insensible, by her obscured reason, to the nocturnal horrors of a place which, in a better state of mind, she would have dreaded to approach after dusk. There was in this room an ancient sculptured font, which she used as a bed to her infant. Other furniture she had none. When it was known that she had gone to reside in this dismal place, the people felt as if it were an imputation against their Christian feelings. She and her babe were repeatedly carried by some one or other of them to their houses, but she always made her way back to the Sacristy. At length, finding her determined to live there, they contented themselves with giving her food and alms, and for several years she wandered about with her boy, under the appellation of *Daft May Gilzean**—a harmless creature that wept and sang by turns. Her lover or husband was no more heard of in the country, although he had several relations living in the neighbourhood, with whom he might have been expected to correspond, if he had remained in life.

Andrew Anderson, the son of May Gilzean, grew up in all the raggedness and misery which might be expected under such circumstances to fall to his lot. It is questionable if he ever knew the comforts of a bed, or of a cooked meal of any kind, till his boyhood was far advanced. The one solacement of his forlorn existence was the affection which his mother always continued to feel for him. It is a custom in the grammar-school of Elgin to give gratuitous education to a poor boy, who undertakes, in consideration of that boon, to prepare

the fires and sweep the rooms: this boy bears the name, *par excellence*, of "the Pauper." Anderson consented to become the Pauper of his day, and thus acquired the elements of a classical education. In proper time, he was bound apprentice to an uncle by the father's side, who carried on the business of a staymaker in the adjoining parish of St Andrews Lhanbryd. This man was of a harsh and ungenerous nature, and did not think himself called upon to extend, to his poor nephew even that limited kindness which he showed to his own children. Thus, while the sons and daughters of the staymaker had milk for their oatmeal porridge, their cousin was condemned to take that meal with a thin liquor formed by steeping the husks of grain—a species of relish, or *kitchen*, which was never resorted to by the Scottish peasantry except when milk was unusually scarce and dear. The treatment which young Anderson received here was altogether so intolerable, that he resolved to throw himself upon the world for a home. Taking a proper opportunity, he left his uncle's house, and disappeared from the country. He made his way to Leith, and thence to London, where he was taken into the workshop of a tailor, who, finding that he wrote neatly, and had some knowledge of accounts, began after some time to employ him as a clerk. He was one day commissioned to take home a suit of clothes to a military gentleman, and to grant a discharge for the account. This gentleman was himself a Scotsman, and bore a commission in a regiment about to proceed to the East Indies. He was, like all Scotsmen at a distance from home, interested in hearing his native tongue spoken, by however humble a person. When, in addition to this, he observed the pleasing countenance and manners of the youth, and found that the discharge appended by him to the account was in a good regular hand, he entered into conversation, asked whence he came, what were his prospects, and other such questions, and, finally, inquired if he would like to go abroad as a soldier and officer's servant. Anderson, who was not perhaps disinclined to leave a country in which there was at least one individual whom he had reason to dread, required little persuasion to induce him to enter into the stranger's views. He enlisted as a private, and immediately after set sail with the regiment in the capacity of drummer, acting at the same time, according to previous agreement, as the valet or servant of his patron.

It would be soon after the beginning of the reign of George III. that Andrew Anderson absconded from the neighbourhood of Elgin. There, the poor ragged boy, who had been cradled in a church-yard ruin, educated as a pauper scholar, starved and tyrannised over as a staymaker's apprentice—the child of *Daft May Gilzean*—was ere long forgotten, or only remembered amongst the thousands of other indifferent things that had passed and gone about the same time. No ray of intelligence respecting him ever found its way to Elgin. His mother was laid with her sorrows in that church-yard which, living, she had already adopted as her abode. Her parents also died in their time. The cruel staymaker perished like the rest. Even those who were kindred to him in blood, had ceased to remember the poor outcast boy—at least as one who had any claim upon their friendship.

* * In the year 1811, an elderly gentleman, attended by a single servant, arrived one evening at the Gordon Arms Hotel in Elgin. He ordered a slight repast, went to bed, and rose by times in the morning. His first question, like that of many strangers in Elgin, was about the Cathedral. "It was walked in," the

waiter said, "but the sexton, an old man, called Saunders Cook, residing in a cottage close beside the western gate, partly lived by showing the ruin, of which he could give all desirable particulars." The old gentleman soon found his way to the residence of Saunders, who forthwith admitted him to the precinct of this splendid relic of the heavier Gothic architecture. Saunders, according to the recollection of a correspondent, was a rather short, broad-built, white-haired, in-toed old shoemaker, about sixty-five, and a great talker. Except on Sundays, and on the occasion of great funerals, he wore a Kilmarnock nightcap on his head, and a leathern apron that tied round his middle, and hung at the top by a punt or thong that went round his neck. It was his custom to saunter on before any stranger, or group of strangers, pointing out the various parts of the building, and relating all that he had to tell respecting it in the sing-song drawling voice usual amongst functionaries of his order. As he was going through his ordinary routine, on the present occasion, the stranger asked if he knew whereabouts in the churchyard a poor woman called Marjory Gilzean had been buried. "Na," answered Saunders; "she was a *pair worthless cratur*; naeboddy kens where she is buried. But I can tell ye where she lived. It was in that place there they ca' the Sacristy. She brought up a bairn there, in a hollow stane, that was ance a font for holy water. I mind the laddie weel: he grew up a browe loon [Morayshire for a stout boy], and was Pauper at our schule." Chancing at this moment to look about, he observed the visitor to have his handkerchief at his eyes. While he paused in his recital, the stranger, when agitation allowed him to speak, said, "Unfortunate I knew she was, but I never heard she was worthless." Well was he entitled thus to take the part of the hapless maniac, for he was that very son whom she had brought up amidst privations inexpressible in this dismal place of shelter. He was now, however, Lieutenant-General Anderson, of the East India Company's service, the honourable possessor of an ample fortune, by means of which he was for ever to abolish, in his native town, the office of Pauper, by extinguishing the necessity which had hitherto compelled the poor scholar to become the drudge of the school, as the price of his scanty education.

General Anderson had returned to his native place, full of the best feelings towards it. Overlooking the painful recollections of his youth, he felt only that charm which the scenes of early years never fail to have for him who has spent his middle life elsewhere. He took a house, first at Leuchars, in the neighbourhood, and afterwards in the town itself, and there lived for several summers, returning to London to spend the winter. Being a man of modest and reserved manners, he spoke little of his life abroad. It was learned, however, that he owed his first steps in promotion to a power he had of readily acquiring languages. Having mastered the Hindostanee, he was sent to a distant place in the interior of India, to act as interpreter on some important occasion. He rose step by step, and at the taking of Seringapatam in 1799, he held so conspicuous a rank, and acted in so creditable a manner, as to be mentioned with honour in some of the public journals. It is thought that his share of the spoils at Seringapatam might be the chief foundation of his fortune. He ultimately retired with the rank of Lieutenant-General in the Bombay army.

At London, on the 23d of November 1815, General Anderson executed a trust-disposition and deed of settlement, assigning his whole heritable and moveable property to six gentlemen, most of them resident in Elgin, to be by them employed in the first place for the payment of a legacy of five hundred pounds to a gentle-

* The *s* in this name is not pronounced.

* Called in Scotland *raw sowers*.

man who seems to have been his godson,* and of one annuity of one hundred, and two of two hundred pounds, to three females, two of whom were distantly related to him, while the third had been his housekeeper at Elgin; and next and chiefly, "for the uses and purposes of founding and endowing an hospital, a school of industry, and free school, within the burgh of Elgin—in the first place, an Hospital for the maintenance of indigent men and women not under fifty-five years of age; secondly, a School of Industry for the maintenance and education of male and female children of the labouring classes, whose parents are unable to maintain and educate them, and for putting out the said children when fit to be so apprentices, to some trade or occupation, or employing them in such a manner as may enable them to earn a livelihood by their lawful industry, and make them useful members of society; and, thirdly, an Establishment of a Master and Mistress properly qualified to conduct a free school, for the education of such male and female children whose parents may be in narrow circumstances, but still able to maintain and clothe their children." With magnanimity rarely exemplified on such occasions, he gave no directions for the perpetuation of his own name in connection with the results of his beneficence. "Which hospital and schools," says the will, "shall in all time coming be described and called by the name of THE ELGIN INSTITUTION FOR THE SUPPORT OF OLD AGE AND EDUCATION OF YOUTH." None were to be admitted into the hospital who had any pension or allowance from other sources, and who were not "of decent and respectable character;" it was also provided that inhabitants of the burgh of Elgin should be preferred; failing them, inhabitants of the other parts of the parish; and, failing these, inhabitants of the county. The benefits of the two schools were open to children of the county; and the testator expressed his wish that, as far as circumstances would admit, the Madras system of education should be conformed to.

This interesting and truly noble-minded man died at his house in Baker Street, London, on the 16th of September 1824. His age is given in the Gentleman's Magazine as 79, which would place his birth exactly at the time when the insurrection of 1745 broke out. The age of 77, assigned to him by an authority which we have consulted in his native town, is probably nearer the truth, as it seems unlikely that a foot-regiment would be quartered in Elgin till after the suppression of the rebellion.† It is satisfactory to know that, after the death of General Anderson, the honour, although perhaps not the prudence, of his mother, was cleared by legal proof—Elspet Anderson, of Garmouth, the daughter of the staymaker, having satisfied a jury that she was the lawful cousin, and nearest legal heir, to the deceased.

Since his death, his trust-disposition has been duly acted upon, and a fine building at the east end of the burgh of Elgin now stands as a lasting monument of his benevolence. We find, from a recently published account of the parish,‡ that five males and five females belonging to the town are at present enjoying the benefits of the Hospital for the Aged; that twenty-two boys and eighteen girls, from every parish in the county, are reared in the School of Industry—which number will probably be increased by other twenty, on the death of two annuitants; and that 230 children are receiving in the Free School "a gratis education suited to their station." Thus the fortune of the founder is, or will soon be, contributing to the happiness of no fewer than three hundred persons.

Thousands every year flock to Scotland, to fall into raptures with the physical sublimities of its hills, and lakes, and waterfalls, or to muse over scenes which genius has peopled with the imaginary beings of romance. It is strongly impressed on us that many, after indulging themselves with the contemplation of these objects, if brought to the remote burgh of Elgin, and informed of the circumstances narrated in this paper, would confess that they had found something

still more beautiful, still more romantic, still more sublime. Let them first behold the edifice in which so many find shelter from the evils of destitution, and so many more receive that nurture which is best to enable them to befriend themselves through life; and then be taken to the small dark cell, where May Gilzean cradled in a hollowed stone, in darkness and wretchedness, the hapless babe whose inherent gifts and honourable use of them were to give him the means of indulging a singular benevolence in shedding all these blessings on his native district; and then let them confess that human nature and human life have their sublimities as well as inorganic nature—and that "these be of them."

NEW MAGNETIC DOCTRINES.

From an English correspondent, who has long been resident in Paris, we have lately received a communication respecting some of those matters of unestablished science, which many ingenious persons in that capital are at present engaged in investigating, and particularly respecting a new magnetic hypothesis, which a gentleman named Azais has just broached in a very laborious work, after twenty years of study and experiment. The subjects touched upon may be, in the opinion of many, unconnected with any actual natural phenomena, and, if so, all notice of them would of course be unprofitable; but it must be remembered that, if not proved truths, neither are they as yet proved falsehoods; and we would say, with submission, that, in their present doubtful state, they are not unworthy of being adverted to, at least in a work which professes no formal scientific character, and in which amusement is a leading object. The remarks of our correspondent appear to us to be conceived in a philosophical spirit, and have our entire concurrence:—

* * * In his book, M. Azais begins by disputing the correctness of the Newtonian doctrine of attraction to the centre, and contends, on the contrary, that there is a magnetic expansion from the centre of all objects to the surface, and that, meeting there with a counteracting magnetic influence, which he calls compression, and which acts upon all points of the surface, the object acquires the roundness which we see in the planets, and other bodies which are round in their state of nature. When the expansive fluid, from its character, or from the operation of external causes, meets with a smaller degree of compression at any point, elongation takes place, and thus he explains the symmetry of all organised beings. * * * All objects (he says) are in a state of vibration; not only those to which we assign life, but also those which hitherto have been considered destitute of motion. If granite or wood be pounded to dust, the minute particles, brought to the eye by means of a powerful microscope, are said to be in a state of vibration. Nay, further, according to this philosopher, the sounds of music are but the expansion of a magnetic fluid, sent forth by the sounding body, as light is sent forth by the sun, or caloric by the globe we inhabit. * * * M. Azais contends for the influence of his magnetic or electric fluid, in keeping up what he calls the equilibrium of the whole of nature. This fluid, according to him, is the residence of life, and, although invisible to the eye, is real and positive in its nature. The brain, he says, is not directly acted upon by the mechanical agency of the fibres of the nerves, but by this fluid, of which the fibres are but the agents [we should suppose that, more correctly, he means the conductors.] The lines of nerves are, says he, but a voltaic pile, with their major and minor poles giving out their fluid, and keeping up the equilibrium designed by our great Creator. All the ideas which the brain receives are, according to M. Azais, conveyed to it in a real, or, as he styles it, bodily form. The scenes which we have witnessed when brought to the brain by memory, are as positively fixed upon it by those globules which represent the reality, as if the object were before our eyes. If we are fatigued, it is because the expansion has exceeded its strength, and been unable to contend with the compression. A state of repose gives new strength to the magnetic internal fluid, and when this is not overtaxed, the just equilibrium is kept up, which gives sensations of health and pleasure. So with all the organs of the brain. Their correspondence with each other is maintained by necessity of expansion, and it is the equilibrium which results from the due exertion of each that gives superiority of intellect or of moral sentiments.

The doctrine of M. Azais must not be confounded with Mesmerism. On the contrary, although he is disposed to admit that there does exist a similarity of nervous organisation amongst certain individuals, from which extraordinary effects may be expected to result, he is not yet convinced that the wonderful feats performed by magnetised somnambulists are not to a great extent to be attributed to delusion or jugglery. He insists that no individual is born without having his fellow on some part of the globe possessing the same magnetic organisation, but he does not therefore believe in the accounts which have been given of somnambulists reading from the pit of the stomach, and penetrating the thoughts of other persons. He confesses, however, that some of these relations have staggered him, because the narrators were men not easily imposed upon, and whose veracity was unquestionable.

More incredulous persons than M. Azais have been

puzzled by the accounts which have been published of magnetic somnambulism. The operation of M. Jules Cloquet in Paris, for cancer, on a magnetised patient, who suffered no pain during the operation, and who exclaimed, *vous me chatouillez*, "you tickle me," was performed in the presence of several distinguished surgeons, and no person attempts to dispute the authenticity of the fact. It must be confessed, however, on the other hand, that, considering the great importance of this operation, if successful in surgical operations, it is remarkable that we have not other proofs of a similar nature. The idea of there having been an understanding between M. Cloquet and the patient, cannot be entertained; for even if M. Cloquet had been capable of deception, which he was not, we are not permitted to suppose that any female could, under the effect of so painful an operation, possess sufficient courage to conceal her sufferings, and indulge in pleasantries, for the purpose of deception. But it may be fairly asked, if the persons who magnetised this female were so successful, why have they not performed similar feats? Common humanity alone was sufficient to make this a duty, putting aside the natural desire which the advocates of the science must feel to place it upon a positive footing. Within the last four or five years, a physician in London professes to have cured acute rheumatism by means of magnetism, and to have extracted teeth without pain whilst the patient was under its effects; and yet it appears to be a disputed point whether he did or did not produce the results alluded to. What is truly extraordinary, as connected with this subject, is, that each party claims the victory, and that the impartial observer hesitates as to giving an opinion for or against the one or the other. At Liege, in Belgium, a physician, M. T—, performed a curious series of experiments on a female of eighteen years of age, whom he had somnambulised. Amongst other feats, this young lady, with her eyes closely bandaged, read from the pit of the stomach articles which were written at the time by the spectators, and particularly by those who came determined to expose what they considered to be a jugglery between the physician and the patient. For several months, the performances of this somnambulist were the topic of general conversation, some persons declaring that they were real, others that they were a cheat; and to this day the medical men of Liege differ, now that they have had time to reflect upon them, as much as they did when they took place. Very recently in London a similar controversy has taken place, and an eminent physician has had to contend against much censure for the part which he took in patronising animal magnetism, and assertions have been made that he was the dupe of a set of designing speculators. On the other hand, hundreds declare that the performances were real; and it is really impossible, with such conflicting testimony, that public opinion can agree as to a verdict. What is the reason that the question cannot at once be set at rest? The tricks of the most expert dealers in sleight of hand have been exposed, and yet the able and enlightened persons who have attempted to detect the tricks of magnetisers, if tricks they were, have not been able to expose them to the public, or even to convince themselves fully that there is not something real in the magnetic somnambulism of the parties on whom the experiments were performed. The Academy of Sciences in Paris has twice decided that animal magnetism has no existence in fact, and yet there is still so much doubt on the minds of some of its most distinguished members, that a commission is to be appointed to examine afresh.

One of the most extraordinary cases of animal magnetism on record, is that related by M. Peletier, a physician of Lyons, and which is the more extraordinary from the circumstance of M. Peletier having been, previously to the occurrence of this case, an utter sceptic in animal magnetism. The case, as related by M. Peletier, is too long to be given entire. The leading points of it will suffice.

A lady, nineteen years of age, of robust constitution, fell into a state of catalepsy through an imprudence. She had been recommended to use the oxide of mercury for the purpose of dyeing her hair; and having done so frequently, so much of the poison was absorbed, that the nervous system was partially overthrown, and fits of catalepsy ensued, during which, smell, taste, feeling, sight, and hearing, were destroyed. When the fit came on, this lady, Madame B—, could distinguish nothing by the eye, whilst, at the epigastrium, sensation was clear and positive, and all the objects presented to it were reflected as in a mirror, surrounded by an atmosphere of fire. This catalepsy, it will be observed, was not the effect of any magnetic experiment, but of accident. It will, however, be seen that it resembled entirely the somnambulism which is said to be produced by operators in animal magnetism. When M. Peletier spoke to the patient, she heard his voice, not by the ear, but by the epigastrium. If he placed himself at a short distance, she heard him imperfectly; but if he made a conductor of his own body, placing one hand on the epigastrium of the patient, and speaking on the joined fingers of the other, she then heard distinctly. On one occasion the physician requested the sister-in-law of the patient to place her hand on her stomach, and, forming a chain of seven persons with their arms fully extended, he placed himself at the extremity, and joining the chain with one hand, he spoke in so low a tone on the fingers of the other hand, that the sister-in-law could not hear what he said, and every word was heard by the patient through the stomach, the sense of hearing, by the ear, being during the fit entirely extinct.

* Archibald Andrew Anderson Lauriston, son of Lieut.-Col. Alexander Lauriston of the East India Company's service, residing in Edinburgh.

† As the statements in this paper are of a somewhat extraordinary nature, it may not be superfluous to inform the reader that they are all, to the best of our knowledge, true. The obscurity which rests over a large portion of the history of the hero may have led to some slight incorrectness in a few of the less important details; but we have used every effort in our power to be correct, and, we believe, are so in all the more important features of the story.

‡ New Statistical Account of Scotland, by the Ministers of the respective Parishes, No. VIII.

If between the hand and the stomach he placed a stick of sealing-wax, the communication was cut off; and although he raised his voice to the highest pitch, the patient heard nothing; but the moment that it was removed, and a finger placed upon the stomach, she heard all that was said, even though in a whisper. The communication was intercepted in a similar way by the interposition of a piece of glass; and if a single person of the chain put on silk gloves, the same effect was produced. Madame B— being very fond of music, two of her relations, who played upon the flute, performed a duet, taking care to connect these instruments with the stomach of the patient, by a chain of persons, or by a wet rope of hemp. If the chain was broken, or the rope became dry, the sound was cut off. With respect to taste and smell, the same phenomena were produced. If bread, wine, tobacco, pepper, cinnamon, &c., were placed in direct contact with the stomach, she recognised each article by the smell; and the mouth underwent, when articles agreeable to the taste were placed upon her stomach, the same movements as if she were eating; whilst, on the contrary, if the articles were repulsive, the mouth, the throat, and the oesophagus, contracted with the same disorder and anxiety as if she were about to vomit. During the whole of this time, the answers made by Madame B— to the questions which were put to her, showed that the brain was in a healthy state, and that the sense of all the communications made by the stomach was instantly conveyed to the cerebral region. If during one of the fits of catalepsy Madame B— was left to herself, she sang with much sweetness and correctness, the face, however, exhibiting restlessness and astonishment, although the air would be of a pleasing and sentimental character. The moment that any object was placed upon the stomach, there was a cessation of the air arising from the diversion to an external source.

M. Peletin having inquired why her features harmonised so little with the character of the air which she was singing, she replied, "I sing, doctor, to divert myself from a frightful spectacle. I behold all my inside; and as the different parts of which I am composed are unknown to me, have strange forms, and are more or less luminous, my features cannot but express what I feel. If a physician were to have for only a quarter of an hour the illness which I have, all the mysteries of nature would be revealed to him; and if he loved his art, he would not desire, as I do, to be rapidly cured."

"Do you perceive your heart?" said M. Peletin.

"Yes; it beats double and both sides at once; when the upper portion contracts, the lower swells, and then contracts; the blood flows out in a luminous state, and passes by two large vessels which are not far from each other."

In another fit the physician said, "Do you still see your inside?" "Yes." "And your head?" "Yes; it is on fire, but not in every part." "And do you see the arm and fingers with which I speak to you?" "Yes, but only when you are speaking to me."

During one of her attacks she said, "I shall, when I awake from this fit, be deaf, and the deafness will remain until after the fit of the morning."

"How do you know that?" said the physician.

She replied, "Because I do not see my ears; a shadow conceals them."

"But why do you suppose you will be deaf for twenty-four hours?"

"I feel it, but cannot explain it."

"After this fit," says M. Peletin, "she was deaf for twenty-four hours, as she had announced."

On another occasion she had in a manner identified herself with her physician. M. Peletin arriving after the usual hour, he had no sooner begun to speak to her by his fingers, than she said, "You are idle this morning, doctor."

"That is true, madam; but if you knew the cause, you would not reproach me."

"I do know it," said she; "you have had a sick headache for the last four hours, and it will not quit you until to-morrow morning at six o'clock. In vain would you attempt to cure your illness; it must run its course."

M. Peletin, who, notwithstanding the numerous proofs which he had received that there was no imposture in the case, was desirous even to the last of discovering something calculated to revive the incredulity which he felt when first called in, said, "Can you tell me on what side lies the pain that I feel?"

She replied, "Over the right eye, the temple, and the teeth. It will pass to the left eye; you will suffer much between three and four o'clock, and at six you will be entirely free from pain."

"Every thing," says M. Peletin, "passed as she had announced." In another part of his relation he says, "If I placed my hand upon that of the patient, and raised it gently, her hand followed mine, and imitated all its motions. If she was seated, she did not fail to rise in obedience to the hand which directed it. And, oh, inconceivable wonder! if I formed a thought without manifesting it by word or action, she was aware of it, and performed what I intended to command as if the determination had proceeded from herself. Sometimes she entreated me to revoke or suspend what I intended to prescribe, but of which I had said nothing, if it was beyond her strength."

M. Azais, in alluding to this relation, attempts, and with no common degree of skill, to connect every part of it with his great principle of magnetic influence;

and he informs us that, marvellous as the account appears, the authenticity of it is unquestionable. The patient herself had no motive for deception, and, if she had wished to deceive, was too rigidly watched for deception to have been practised. This case, if it even stood alone, ought rather to lead to scientific investigation than induce us to regard as impossible what cannot immediately be made comprehensible to our understanding. Men are too prone either to receive as true, on the testimony of others, what they will not give themselves the trouble to inquire into, or to reject as absurd what their comprehension does not immediately grasp. This is not the way to arrive at truth; it is not the way to bring about improvement. Some persons, with their eyes open, will not believe what they see; others shut their eyes, in order that they may not see what they do not wish to believe. In phrenology, in animal magnetism, in any disputed theory or doctrine, we should, if convinced of its correctness, respect the doubts, and appeal by facts to the judgment, of others; if, on the contrary, we feel called upon to condemn, the motives of our condemnation should be set forth without acrimony.

MRS BROUGHTON'S 'SIX YEARS' RESIDENCE IN ALGIERS.'

THE basis of this volume is composed of a diary kept by Mrs Blanckley, wife of the British consul at Algiers, between the years 1806 and 1812; the remaining portion consists of interjected and ampler passages, written by the editor Mrs Broughton, who was one of the daughters of Mr and Mrs Blanckley, and was a very young person while resident with her parents in that part of the world. The whole conveys a very faithful and intelligible, and in some respects even striking, picture of such parts of the internal policy and domestic life of the barbarian state as were apt to fall under the attention of the English minister's family, as well as of that atrocious system of Christian slavery which the Algerines practised so many years with impunity, but which ultimately led to their overthrow. It is impossible to read this volume without wondering greatly that the extinction of Algiers as a state occurred so lately as 1830.

Of the mode in which the governors or deys succeeded each other, we have some curious memorabilia. The Ottoman Porte, to which Algiers had long been tributary, seldom interfered in the matter, and was accustomed to send the *caftan of honour* to every wretch who could contrive to raise himself to the office. The people of Algiers themselves had equally little share in the various changes of government. The murder of one dey and the accession of another—for the two events were rarely unconnected—were brought about by conspiracies amongst the troops, and these conspiracies were always formed upon some understanding of mutual interest, the proposed dey agreeing, if successful, to give ample rewards to his associates. When a conspiracy broke out, and it was known that the life of the old dey was threatened, a painful feeling usually spread through the city, for it was not uncommon for the wretched man to make his escape into the streets, and there be hunted down by the soldiery. But when all was over, and the new dey had taken possession of his throne, the tumult for the most part subsided very soon, and all things went on as formerly. Mrs Blanckley's diary describes two revolutions of this kind as having taken place during her stay there with her family. The first of these events is thus narrated.—"7th November, 1808. Accounts, about eleven o'clock, were sent to us from town, saying, that the Pacha Achmet (the reigning dey) was shot on the terrace of a house belonging to a Jew, when endeavouring to escape; he had succeeded in running over the terraces of several houses from the palace of his wife, to which he had first escaped; and on being pursued thither, he got upon the terrace, and from thence over several others, until he was shot through the body and leg by a very young Turk. He was then by the soldiers dashed from the terrace into the street; and they cut off his head, and carried it to show to the new dey. In the evening we heard that every thing was quite quiet." To show how little even the consuls of civilised powers, then resident at Algiers, thought of such revolutions, the record of the 10th of November tells us, that "rain yesterday prevented Mr Blanckley going to pay his respects to the new dey, but to-day he went through that ceremony." The dey elevated on this occasion held his place only till the ensuing 4th of March, and a further proof of the coolness with which all men regarded these changes, is derived from the diary, which tells us that on the same day on which this dey was strangled, Mr Blanckley and the other consuls all went to pay their respects to his successor.

This custom of testifying the respect of the consuls for his deyhaly of Algiers, by appearing before him in a body, led to some odd scenes, previously to Mr Blanckley's time, in consequence of quarrels for precedence between the representatives of France and Britain. The diary before us tells the story thus:—"All the consuls have to-day paid their respects to his highness, with the exception of the French. He always paid his court the night before, ever since the following circumstance occurred. From time immemorial a scuffle for precedence had taken place between the British and French Consuls-General, on every oc-

casión in which they had met in the dey's presence; none of the envoys of the other powers, of course, ever presuming to dispute precedence with the representatives of the two great rival nations. The consular dignity must on these occasions, if the account is correct, have been greatly compromised, as it was not by Machiavelian skill that so momentous a point was usually decided, but by the superior personal agility exercised by his Britannic Majesty's representatives; to the no little edification of the long-bearded courtiers, who witnessed the indecorous exhibitions of European gymnastics. It at last happened that Consul Falconer, a gentleman still remembered by the sobriquet of 'the mad consul,' was determined that, in Algiers at least, an end should be put to Gallic presumption. On some grand festa, he therefore arrived at the palace, just before the time of admission to the dey's presence; and having posted himself at the foot of the great staircase, he there patiently awaited the appearance of the French consul, who no sooner came up than the usual race began, until they reached the top of the stairs, and were in the august presence of his highness, when Mr Falconer suddenly caught his antagonist round the waist, threw him over the banisters, then composedly walked forward, and paid his respects to the dey, amidst the shouts of laughter and applause of all present. Happily the poor Frenchman escaped without any hurt, except the incurable mortification he experienced, which ever after prevented him and all his successors from again entering the lists with John Bull." Mr Blanckley had the merit of breaking through these paltry bonds of etiquette, and, by placing himself on terms of amity with the French consul, was enabled to do much good to his countrymen. Privateers of both nations came into the port of Algiers with prisoners, who were readily ransomed by exchanges, after a good understanding was established between the consuls.

Mr Blanckley's labours in favour of the British prisoners who fell under his notice, seem, indeed, to have been beyond all praise. Nor was his benevolence exerted alone in favour of his fellow-countrymen. The cruelties and privations to which the Christian slaves were subjected at Algiers, were of the most appalling kind. To these had been subjected for many years an old Sicilian named Francisco, with his sons Luciano and Marianno, all of whom had been captured at once by an Algerine corvette. Having fallen under the notice of the English consul, Francisco and his younger son Marianno had their sufferings greatly alleviated by being taken, with permission from the dey, into Mr Blanckley's service. At length, "after many abortive attempts" (says Mrs Broughton, in her additions to her mother's diary) to propitiate the dey in behalf of the poor old man, whose wife and daughters had sold all they possessed in the world, to send the products to Algiers, in the hope that it might suffice for his ransom, though, alas! it fell so far short of the fixed sum, that the dey would not hear of its acceptance, my dear father on a particular occasion (what exactly I do not now recollect), on which, according to *usanza*, the dey was bound to make a present of value to the English Consul, as was his constant practice in similar circumstances, made a public request that his highness would graciously be pleased, instead of any other offering, to bestow upon him a Christian slave. This in royal courtesy, even in Algerine etiquette, the pacha could not refuse, and Francisco, as well as several other equally fortunate slaves, were granted to his request, although the dey latterly said, 'Take care, Signore Console, that you have not to reproach yourself with the loss of my head, for I fear I may with justice be accused of being over-generous in thus parting with the property of the state.'

When the old man was on the point of leaving us, my father asked him, if he should ever find a propitious moment in which he might prevail upon the dey to grant him the liberty of one of his sons, on the payment of the hitherto considered inadequate sum of money which had been forwarded for the purpose of his own ransom, to which of his sons should preference be shown? 'Ask me not, sir,' replied the agitated father; 'I cannot make a choice between two children equally dutiful and affectionate, and equally dear to me.'

An opportunity for the furtherance of my father's benevolent intentions did at length occur, and he named our own servant Marianno as the object worthy of being benefited by the dey's liberality; and in consequence, his passage was engaged on board a ship going to Malta. He took a respectful leave of the family, and we all looked at the vessel as it sailed out of the bay, of course believing that it contained our honest *sotto voce*. But to the astonishment of the whole household, Marianno entered the drawing-room that very evening, and throwing himself at the feet of my parents, he exclaimed, 'Pardon me, my benefactors, if your servant has thus presumed to deceive your goodness. Luciano was my elder brother, and in every respect more worthy and capable of being more useful to our parents than I am; and I have therefore, against his own will, by proving to him, as he is able to do more good, that it was his bounden duty to go in my place, with difficulty persuaded him; and believe me, that it is far happier for me; and I hope it may please God to let me serve you while I live.'

Tears of mingled sympathy and admiration were the only answers to this model of fraternal piety, whose last wish was, however, unfulfilled; for Marianno was one of the weeping group that escorted us to the *Marina* on the evening of our embarkation at Algiers, and he

* Feet octavo. London, Saunders and Otley; Edinburgh, Bell and Bradfute.

was one of Lord Exmouth's triumphant proofs that Britannia rules the waves."

With another extract we shall close our notice of this volume, though in its pages we might find many other passages that are both lively and interesting. The extract alluded to gives countenance to the system of Freemasonry, as being, at times at least, of no light service to the initiated. The name of Babastro, a renowned Spanish corsair, who, under the protection of Bonaparte, did much injury to British small-craft in the Mediterranean, is often mentioned in this work. "Must I (says Mrs Broughton), whilst the name of Babastro occupies my pen—must I, who ranked the name of Babastro amongst the Jack-the-giant-killers, ogres, hobgoblins, evil geni, spiteful fairies, and *croque mitaines* who so prominently occupied my young imagination—must I, in justice and in charity, trace one redeeming trait? Yes, even so; I will, in my dear father's spirit, who never failed, whenever circumstances led him to speak of this one of his arch-plagues, always to conclude by adding the only palliating circumstance with which he was acquainted, and from which he deduced a strong argument in support of one of his most favourite dogmas, viz. that great benefit had accrued to mankind by the establishment and continuation of Freemasonry, of which he was a most decided admirer and zealous advocate. After the capture of an English prize by this so-called corsair, and whilst his crew were following their usual honourable practice of stripping our unfortunate countrymen (to which they induced them to submit by holding over them unsheathed knives), that they, the gallant captors, might thus exactly ascertain the precise amount of their booty; it so occurred, that the master of one of the luckless English vessels, whose name escapes my recollection, whilst undergoing this unceremonious disrobing, made use of one of those mystic gestures invisible to all but the initiated brethren of the trowel and apron. Whatever that sign was, it passed not unnoticed, for instantly was his hand clasped in that of Babastro, and an immediate order was given by him to his satellites to release the English captain from their grasp; and he desired, that whatever property was ascertained to belong exclusively to him, should by all be held sacred, and restored to him. Nor were these professions a mere *façon de parler*, for most strictly were they fulfilled, as I perfectly remember hearing the English captain relate to us. All I recollect besides of this chieftain of the privateers which so long infested the coast of Algiers, is, that his master Napoleon judged him worthy of being named a member of the legion of honour."

LIFE AND WRITINGS OF DR. DONNE.

JOHN DONNE was born in London in 1573, of a Catholic family; through his mother he was descended from Sir Thomas More, and Heywood the epigrammatist. He was educated partly at Oxford and partly at Cambridge, and was designed for the law, but relinquished the study in his nineteenth year. The great abilities and amiable character of Donne were early distinguished. The Earl of Essex, the Lord Chancellor Egerton, and Sir Robert Drury, successively befriended and employed him; and a saying of the second of these eminent persons respecting him is recorded by his biographers—that he was fitter to serve a king than a subject. He fell, nevertheless, into trouble, in consequence of secretly marrying the daughter of Sir George Moore, lord-lieutenant of the Tower: this step kept him for several years in poverty, and, by the death of his wife, a few days after giving birth to her twelfth child, he was plunged into the greatest grief. At the age of forty-two, Donne became a clergyman, and soon attaining distinction as a preacher, he was preferred by James I. to the deanery of St Paul's; in which benefice he continued till his death in 1631, when he was buried honourably in Westminster Abbey.

The works of Donne consist of satires, elegies, religious poems, complimentary verses, and epigrams: they were first collected into one volume by Toulson in 1719. His reputation as a poet, great in his own day, low during the latter part of the seventeenth and the whole of the eighteenth centuries, has latterly in some degree revived. In its days of abasement, critics spoke of his harsh and rugged versification, and his leaving nature for conceit: Dryden even hints at the necessity of translating him into numbers and English. It seems to be now acknowledged that, amidst much rubbish, there is much real poetry, and that of a high order, in Donne. He is described by a recent critic as "imbued to saturation with the learning of his age," endowed "with a most active and piercing intellect—an imagination, if not grasping and comprehensive, most subtle and far-darting—a fancy, rich, vivid, and picturesque—a mode of expression terse, simple, and condensed—and a wit, admirable as well for its caustic severity, as for its playful quickness"—and as only wanting sufficient sensibility and taste to preserve him from the vices of style which seem to have beset him. Donne is usually considered as the first of a series of poets of the seven-

teenth century, who, under the name of the Metaphysical Poets, fill a conspicuous place in English literary history. The directness of thought, the naturalness of description, the rich abundance of genuine poetical feeling and imagery, which distinguish the poets of Elizabeth's reign, now begin to give way to cold and forced conceits, mere vain workings of the intellect, a kind of poetry as unlike the former as punning is unlike genuine wit. To give an idea of these conceits—Donne writes a poem on a familiar popular notion, a broken heart. Here he does not advert to the miseries or distractions which are presumed to be the causes of broken hearts, but starts off into a mere play of conceit upon the phrase. He entered a room, he says, where his mistress was present, and

love, alas!
At one first blow did shiver it as glass.

Then, forcing on his mind to discover by what means the idea of a heart broken to pieces, like glass, can be turned to account in making out something that will jingle on the reader's imagination, he proceeds thus:

Yet nothing can to nothing fall,
Nor any place be empty quite,
Therefore I think my breast hath all
Those pieces still, though they do not unite:
And now, as broken glasses show
A hundred lesser faces, so
My rays of heart can like, wish, and adore,
But after one such love can love no more.

There is here, certainly, analogy, but then it is an analogy which altogether fails to please or move: it is a mere conceit.

It is at the same time to be borne in mind that the quality above described did not characterise the whole of the writings of Donne and his followers. They are often direct, natural, and truly poetical, in spite, as it were, of themselves. Donne, it may be here stated, is usually considered as the first writer of that kind of satire which Pope and Churchill carried to such perfection. His satires, to use the words of a writer already quoted, are rough and rugged as the unheaven stones that have just been blasted from the quarry.

The specimens which follow are designed only to exemplify the merits of Donne, not his defects:—

ADDRESS TO BISHOP VALENTINE, ON THE DAY OF THE MARRIAGE OF THE ELECTOR PALATINE TO THE PRINCESS ELIZABETH.

Hail Bishop Valentine! whose day this is,
All the air is thy diocese,
And all the chirping choristers
And other birds are thy parishioners:
Thou marryest, every year,
The lyric lark and the grave whispering dove;
The sparrow that neglects his life for love,
The household bird with red stomacher:
Thou mak'st the blackbird speed as soon,
As doth the goldfinch or the halcyon;
This day more cheerfully than ever shine;
This day which might inflame thyself, old Valentine! * *

VALEDICTION—FORBIDDING MOURNING.

[This poem was composed on parting with his wife, to attend an embassy in France.]

As virtuous men pass mildly away,
And whisper to their souls to go;
Whilst some of their sad friends do say,
The breath goes now—and some say, no;
So let us melt, and make no noise,
No tear-floods, nor sigh-tempests move;
'Twere profanation of our joys
To tell the laity our love.
Moving of th' earth brings harms and fears,
Men reckon what it did, and meant;
But trepidation of the spheres,
Though greater far, is innocent.
Dull, sublunary lovers' love
(Whose soul is sense) cannot admit
Absence, because it doth remove
Those things which alimanted it.
But we're by love so much refind,
That ourselves know not what it is;
Inter-assured of the mind,
Careless eyes, lips, and hands to miss.
Our two souls, therefore (which are one),
Though I must go, endure not yet
A breach, but an expansion,
Like gold to airy thinness beat.
If they be two, they are two so
As stiff twin compasses are two;
Thy soul, the fixed foot, makes no show
To move, but doth, if th' other do.
And tho' it in the centre sit,
Yet when the other far doth roam,
It leans, and hearkens after it,
And grows erect as that comes home.
Such wilt thou be to me, who must
Like the other foot, obliquely run;
Thy firmness makes my circle just,
And makes me end where I begun.

THE WILL.

Before I sigh my last gasp, let me breathe,
Great Love, some legacies: here I bequeath
Mine eyes to Argus, if mine eyes can see;
If they be blind, then, Love, I give them thee;
My tongue to Fame; to ambassadors mine ears;
To women, or the sea, my tears;
Thou, Love, hast taught me heretofore,
By making me serve her who had twenty more,
That I should give to none but such as had too much before.
My constancy I to the planets give;
My truth to them who at the court do live;
My ingenuity and openness
To Jesuits; to Buffons my pensiveness;
My silence to any who abroad have been;
My money to a Capuchin.
Thou, Love, taught'st me, by appointing me
To love there, where no love received can be,
Only to give to such as have an incapacity.
My faith I give * * *
my best civility;
And courtship to an university;

* That is, Absence.

My modesty I give to soldiers bare;
My patience let gamblers share:
Thou, Love, taught'st me, by making me
Love her that holds my love disparity,
Only to give to those that count my gifts indignity.

I give my reputation to those
Which were my friends: mine industry to foes;
To schoolmen I bequeath my doubtfulness;
My sickness to physicians, or excess;
To nature all that I in rhyme have writ!
And to my company my wit:
Thou, Love, by making me adore
Her who begot this love in me before,
Taught'st me to make as tho' I gave, when I do but restore.
To him for whom the passing bell next tolls
I give my physic books; my written rolls
Of moral counsels I to Bedlam give;
My brazen medals, unto them which live
In want of bread; to them which pass among
All foreigners, my English tongue:
Thou, Love, by making me love one
Who thinks her friendship a fit portion
For younger lovers, dost my gifts thus disproportion.
Therefore I'll give no more, but I'll undo
The world by dying, because love dies too.
Then all your beauties will be no more worth
Than gold in mines, where none doth draw it forth.
And all your graces no more use shall have
Than a sun-dial in a grave.
Thou, Love, taught'st me, by making me
Love her who doth neglect both me and thee,
To invent and practise this one way to annihilate all three.

SYMONS'S "ARTS AND ARTIZANS AT HOME AND ABROAD."

MR JELINGER C. SYMONS, one of the Assistant Commissioners of the Handloom Inquiry, and a notable example of a class of literary men now fast rising into importance, inquisitive and keen-sighted as to all matters on which national wealth and individual happiness depend, has here applied himself to the important task of comparing the condition of British working-men, of all classes, with those of corresponding classes in the other countries of Europe. Of his personal qualifications for this undertaking, we have no reason to doubt: of his opportunities and means, we have some account in the preface. "The researches I have assisted in making," says he, "under the Handloom Commission, and more especially my subsequent mission of inquiry into the relative circumstances of the artisans of France, Belgium, Austria, and Switzerland, aided by the facilities afforded me through the personal and official services of our ambassadors, have necessarily opened to me a wide and valuable field of observation." * * * Mr Symons is thus, perhaps, as well prepared as any other man (in all probability much better) to present a view of the condition of the labouring classes abroad. Yet we must confess we should like to see this inquiry still more seriously taken up. It would be well worth while for government to see a corps of properly qualified persons, who should make it the business of years to obtain satisfactory information on a point of so much consequence.

It may be assumed from the statements adduced by Mr Symons, that the ordinary weekly wages of workmen of the Class of First Skill in Great Britain, as machine-makers, and the finishers of many of the trades, are from 25s. to 35s.—average 30s. Those of workmen of the Class of Second Skill, in which we include spinners in factories, and common artisans, as tailors, masons, carpenters, compositors, &c., range from 17s. to 25s.—average 21s. A Third Class, whose labour is comparatively light, and skill small, as carders, and weavers by power in factories, fustian cutters, &c. appear to have at an average about 14s. The Fourth Class, which we compose of spadesmen, ditchers, farm-labourers, and so-called unskilled labourers in general, have 9s. 6d. at an average. At the time when these summaries were taken down (before the late rise of markets), beef was 6d. per pound and wheat flour 2d.; so that the workmen of the various classes could respectively, with their average weekly wages, purchase 60, 42, 25, and 19 pounds, of the one article of consumption, and 180, 126, 84, and 57, of the other.

In Belgium, in the flourishing machine-making establishment of Mr Cockerill at Seraing, where uncommonly high wages for the country are given, the workmen whom we conceive to correspond with those in our own country entitled Class of First Skill, have from 5 to 10 francs (from 4s. 2d. to 8s. 4d.) per day—say for average 6s. 3d., or 37s. 6d. per week. The wages of this set, however, are evidently peculiar, owing to the difficulty there must be in Belgium in getting even the small number of properly qualified men required. Forgers, founders, and workmen in the proving department, earn only about 44 francs (3s. 9d.) per day, or 22s. 6d. per week. Wages in this establishment are said to be 10 per cent. higher than in the rest of Belgium, a fact which we must attribute to the recent rise and rapid progress of the work, every thing being prosperous and hopeful. The average wages at Seraing are 2s. 11d. per day, or 17s. 6d. per week; and the lowest ever paid to an able-bodied workman are 2s. 3d., working 6 days a week, and 12 hours a day.

While a peculiarity seems to rest on the Class of First Skill in Belgium, we have sufficiently distinct

* Duodecimo, 270 pages. Edinburgh, W. Tait; London, Simpkin, Marshall, and Co.; Dublin, John Cumming. 1838.

results as to the rest. The spinners at Ghent, a portion of the Class of Second Skill, earn 13s. 9d. (16½ francs) per week. The wages of masons, tailors, compositors, and other workmen of the Class of Second Skill, are about the same, or rather less. Men of the Third Skill in Belgium earn about 9s. per week, while agricultural labourers in purely rural provinces, being of the Class of Fourth Skill, have only 4s. 6d. to 6s. a-week, without food. In the provinces, however, in which manufactories are situated, as Liege and Namur, agricultural labourers get equal wages with food. We have here an instructive fact as to the efficacy of manufactures in improving the condition of a rustic population, and of all who depend on land. It is to be observed, that the hours of work throughout Belgium are in general longer than with us, ranging from 11½ to 15.

While the money wages are thus, with one unimportant exception, considerably below those of Great Britain, provisions are much cheaper than with us. Bread is there only 1½d. per pound. An able-bodied man in the country will support himself comfortably on 7d. a-day. We shall here quote some particulars from Mr Symons:—

"The food of the working-classes, not only of Belgium, but of all the countries of the continent, consists of vegetables; meat is not the food of the working classes, either of Belgium or of any other country. It is the relish used with food. The Italian eats maccaroni; the staple food of the French and Germans is bread or cabbage; of the Irish, potatoes (and the consumption of potatoes, as a main article of sustenance, is by no means confined to the United Kingdom, but is rapidly spreading over the continent). It is a beautiful fiction to describe John Bull as eating beef. If 'John Bull' means two-thirds of the population, John Bull is living on vegetable diet; and not above one-third of him is nourished by meat. The Indians eat rice; the West Indians, yams and bread-tree; the Africans, dates; in fact, a fraction, and that a very small one, of mankind are carnivorous.

The workmen employed in the iron-works of the Hainault, Liege, and the machine-making factories of Seraing, Bruxelles, Ghent, &c., live on potatoes and vegetables, with a piece of meat among them, for dinner regularly; coffee of chicory; and on the Sundays, spirits in moderate quantity. These are the best paid.

The workmen who come under the second class are the masons, blacksmiths, carpenters, &c., of the towns, the woollen factory and domestic weavers, who live nearly in the same manner, but consume either a less portion of meat, or take it only three or four times a-week.

The cotton-weavers and factory workmen live less well. Potatoes and vegetable soup form their chief food, with bread half rye and half wheat; coffee, and occasionally a glass of spirits, and commonly brown beer, are their beverage. This beer is particularly nasty, but, I believe, wholly free from cocculus indicus, &c. &c.—pure malt, hops, water, and salt, ill proportioned, and execrably boiled.

The linen-weavers and the common labourers are identified, and consume potatoes and rye-bread, which is a common article of consumption in Belgium, and indeed generally on the Continent amongst the poorest classes, vegetable soup, rarely flavoured with meat, coffee of chicory, beer, &c.

However coarse the food may be on which the Belgian artisans subsist, the abundance of their meals is most striking. I was constantly in the habit of entering their dwellings at meal-times, and I uniformly found the contents of the table even greater than the capacity of their appetites.

Agricultural labourers are well fed: they have bread and coffee in the morning, vegetable soup for dinner, with meat three times a-week, with beer. The poorest of all eat rye-bread, and potatoes, with coffee."

The facts brought forward by Mr Symons respecting the condition of working-men in France, are not favourable. Overlooking the Class of First Skill, respecting which we find no distinct facts, it appears that artisans (Second Skill) in Paris, as carpenters, masons, shoemakers, &c., earn about 2s. 6d. (3 francs) per day, or 15s. per week. Artisans of a higher order of skill, as engravers, jewellers, and tailors (for tailors are there men of a higher skill), earn at an average 3s. 6d. per day, or 21s. per week. In the country, however, 1s. 8d. per day, or 10s. per week, form the wages of the most of trades, at an average. In Lyons, where the silk-weaving is now once more flourishing, the chef d'atelier, or master of a shop of about ten looms, makes 12s. 6d., and the ordinary weavers under him about 10s. per week. Spinners at Guebwillers make 13s. 6d. per week—in Normandy 14s. 7d. at an average, working between thirteen and fourteen hours a-day. A power-loom weaver, having two looms, makes 12s. 6d. a-week. Handloom weavers, working from thirteen to fourteen hours a-day, average for the most skilled class 6s. 3d. a-week, for the second class 4s. 4d. The wages of a country labourer in France are, in summer 9s., and in winter 7s. per week—a considerably higher rate in proportion than the wages of the artisans and spinners. In the spinning factories at St Quentin, in the north of France, which are prosperous, the average of wages for all persons employed was found by Mr Symons to be 5s. 10d., while in Lancashire it is 10s. 6d.

Food is cheaper in France than in England. At St Quentin Mr Symons found bread at 3½d. for 2 1-5th pounds, and beef of the common sort at 5½d. for the pound of 18 ounces. Yet the lodging and food of the working-classes are greatly worse than with us. The

houses are described as for the most part dirty, comfortless, and evincing every symptom of bad management and poverty combined. The working-people are exempt from our most besetting vice of intemperance, but "they are not moral for that; their want of prudence is excessive; they live from hand to mouth; the least illness, or want of work at all prolonged, plunges them into a state of profound misery." The silk-weavers of Lyons are an emaciated miserable-looking set of beings, diseased and under-sized. "In that town, one room frequently contains a man and his wife, two or three children, and a workman and his wife." In the poor district called the *Landes*, the food of the agricultural labouring-class consists of "rye bread, soup made of millet, cakes made of Indian corn, now and then some salt provision and vegetables, rarely if ever butcher meat; their drink water. In other parts of southern France they live better. They eat wheaten bread, soup made with vegetables, and a little grease or lard twice a-day, potatoes and vegetables, but seldom butcher meat; their drink is wine or piquette (a thin liquor made from the dregs of grapes); a family could lay something by from their gains at the end of the year, as the wants of the lower classes are much fewer than in England; in fact, the luxuries of tea, &c. are unknown."

The working people of Switzerland appear, from Mr Symons's statements, to be in an uncommonly comfortable condition. It is difficult, however, to convey a just idea of their incomes, in consequence of their almost invariably possessing small pieces of land, on which they raise grain or potatoes, or rear sheep and cattle, and from which accordingly they derive much of their subsistence. Of the highly skilled labourers, as the numerous watchmakers of southern Switzerland, Mr Symons gives no returns. Journeyman artisans, again, have generally small wages (from 3s. to 5s.), with board and lodging. In "an average cotton-mill in Argovia" (the hours of labour being from 6 to 11 and from 12 to 3 past 7), the weekly wages are, on an average—spinners, 7s. 6d.; carders, 5s.; girls, piecers, &c., 3s. 9d.; power-loom weavers, 3s. 9d. In the country, common out-of-door labourers get 9d. a-day in summer, and 7½d. in winter, with a quart of wine and half a pound of bread. On an average in the German cantons, bread is from 1d. to 1½d. per pound of 17 ounces, or about the half of what it now is in England; meat, from 2½d. to 4½d. per Swiss pound. "I confidently believe," says our author, "that it would require 30s. per week in England, in the neighbourhood of any country town, to put a man, his wife, and three children (two of whom shall be above 15 years of age), in the same condition, and in all physical respects on a footing with the average of Swiss artisan peasants having the same family. * * The cantons of St Gall and Appenzel, which are perhaps among the first of the German manufacturing cantons, present a most enchanting picture of the happiness of the artisans, combined with a low amount of money wages. * * The cottages are scattered separately over the vales and hills, each standing in the midst of its little estate, with the goats or sheep, with their melodious bells to their necks, grazing on the land, which is generally pasture. The interior of the cottages, which are built of wood, are cleanly beyond description, and are well furnished with every article of cottage comfort." Hand-loom weaving is, in Switzerland, "considered in its proper light, namely, as an occupation too easy and light to be remunerated otherwise than by proportionately low payment. * * The high education of the Swiss soon taught them to perceive that a handicraft, at least as far as plain weaving is concerned, requiring the skill of children and the strength of women, must necessarily be remunerated by the wages of children's and women's labour. Weaving, therefore, except in the fancy work, has long ceased to be a separate employment, and exists but as the occupation of children, women, and elderly men, or as occupying the intervals of higher branches of adult industry." Agricultural labourers work at the loom in the evenings, in bad weather, and in winter, when the English farm-labourer is idle.

Mr Symons considers the working-people of Austria as "far from ranking low in the scale of industrial welfare among the nations of the continent." The weekly wages of factory labourers average as follows:—Spinners, 10s.; women, 6s.; children, 2s. 4½d.; the hours, however, are "exceedingly long," being frequently 15, and in some instances 17, per day, exclusive of meal times. A carpenter or mill-wright will earn 10s. per week. Common bread is 1d. 1-6th, and beef 3d., per pound. "In Austria, the working-classes are generally contented, but certainly an ill-informed people. They are, moreover, weaker in intellect than [the inhabitants of] perhaps any of the surrounding countries." "Almost every father of a family has a house and several patches of land. The house and land may have cost L.100," one-half or three-fourths of the purchase-money being borrowed at 5 per cent. This is a system much like that described as existing in the Channel Islands.

In Prussia, at the flourishing works of Elberfeld, weavers make from 8s. to 16s. per week, and dyers 12s. for hard work with long hours, or 9s. for less severe work. In northern Prussia, wages are not so high. Mechanics, as carpenters and blacksmiths, earn in the towns from 9s. to 11s. per week; shoemakers, tailors, &c., about 7s.; common labourers in towns 6s. in summer, and 4s. 6d. in winter. Agricultural labourers, besides free house, fuel, and sometimes half an acre of ground, earn from 2s. 6d. to 3s. 6d. per week. In

Wurttemberg, the best artisans in towns are fed and lodged by their masters, and receive from 1s. 8d. to 4s. 2d. weekly. Farmers hire their servants by the year, feed and lodge them, and give them, in the villages, from L.1, 13s. 4d. to L.3, 6s. 8d., in the towns from L.4, 3s. 4d., to L.5, yearly. These workmen "in the morning eat soup, potatoes, or bread; dinner, vegetables or pudding; between dinner and supper, bread; supper, potatoes and milk, or soup; once or twice a-week, meat. Wages, such as they are, go far. Even day-labourers can save great part of their earnings."

We here conclude our abbreviations of the statements of Mr Symons respecting the condition of working men in various European countries. Summaries and general views must form the subject of a second and concluding paper.

A STORY FROM HERODOTUS.

ONCE on a time there sat on the throne of Egypt a prince named Rhemphis, or Ramsinitis—it is no great consequence which; he was an aged gentlemanly sort of person, very fond of amassing riches; a propensity he had so unremittingly endeavoured to gratify during his whole career, that he had become ultimately one of the wealthiest monarchs that ever swayed the Egyptian sceptre. But was he happy after he had arrived at this consummation of his wishes? Not exactly so; and on this rests our present story, the facts of which are faithfully taken from the Greek historian Herodotus, though we claim and use the privilege of relating them in our own humble way.

Rhemphis, then, had accumulated great treasures of gold, and silver, and precious jewels. It was perfectly delightful to the old king to look upon them, but the fear of losing them came in the way to mar his enjoyment. The monarch distrusted his servants and every body about him, naturally enough supposing that every one regarded such objects with eyes as covetous as his own. This idea became the torment of the king's life. What was to be done! To do him justice, Rhemphis was not cruel or tyrannical, and although particular persons among his dependents might be the chief objects of his uneasy suspicion, he never once thought of the plan of inviting them to a banquet, and letting loose executioners upon them in their hour of unguarded relaxation; which was the plan adopted by a certain successor of his, some two or three thousand years afterwards, in order to get rid of four or five hundred servants (usually called Mamelukes) who had become objects of jealousy and dislike to their master. Rhemphis never took such a scheme as this into his head. The plan that he did fall upon was the simple one of building a secure place for the reception of the gold which he was afraid of losing. With this view he called an architect, or rather several architects, before him, to consult about the stone strong-box he had resolved to build. We say several architects, because there is strong reason to believe that the job was executed by contract. The builder to whom the employment fell, executed it, at least in a way and manner very different from the employer's wishes, which renders the presumption of its being a contract very strong. The new treasury was erected close to the side of the palace walls, and had no opening whatever, excepting one to the private apartments of Rhemphis, in the interior of the royal building. Nothing but a blind blank stone wall, of most sufficient strength, was presented to gazers from the outside; and as for the door leading to and from the palace, the king took excellent good care, both that the keys of it should never for a moment leave his own royal girdle, and that its strength should be such as to render access without these lock-pickers impossible.

Rhemphis was absolutely happy, or at least wonderfully merry, when once he had got this strong-box fairly made, and his treasures deposited in it. Every day after dinner, to the great astonishment and also to the satisfaction of his only daughter—a creature young and beautiful as the dawn—he would make an attempt to carol an emphatic ditty, which, being translated from the Coptic, approached very nearly in significance to our own "Begone, dull care!" But this state of complacency did not continue long. On one of his solitary visits to his strong-box, it struck the king that things were not as he had left them at his previous visit. He missed some portion of his golden hoards; but their total amount was so immense, that he could not be certain of the fact until he had made a mark, and examined a second time. His suspicions were confirmed; his gold had been pilfered, and that in no small quantities! From that hour, as may be supposed, the king's comfort was utterly destroyed, and the more so, because he could not form the slightest conception of the authors of the robbery, or the manner in which it had been effected. The lock and seals—for he was in the habit of using the additional precaution of sealing up the door—were apparently untouched. It was next to impossible that any person could have entered by the door, and, as Rhemphis held up his lamp, and looked around the dead walls, he thought it equally out of the question to suppose any one could pass through them. Nevertheless, on succeeding visits the monarch perceived the diminution of his gold still to continue. Never was old gentleman so puzzled, so distracted. How could the thief get in, and who could the thief be? All that Rhemphis could determine on the matter was, that the pilferer must be one of his own servants; and having arrived at this conclusion, the next question was, How

to catch him? To place guards around the place would have been ridiculous, as the unknown plunderer would thereby have been deliberately warned of his danger. At length Rhemphus resolved to place traps *inside* of the treasure-house, and around the vases containing the precious hoards. The king's confidential artificer got the traps made accordingly, and they were, with all possible speed, set in the requisite situation. But before we tell the issue, we must introduce the thief, or rather the thieves, to the reader.

The job of building the stone strong-box, it has been hinted, was in all probability done by contract. This is to be hoped at least, seeing that poor payment would furnish some little apology for the conduct of the builder. That personage so disposed one of the large stones of the wall on the outside, that it could be easily removed by two or even one man of ordinary strength, and a ready access thus opened to the treasures within. The architect never made use, personally, of this avenue to wealth; but he fell ill soon after the completion of the building, and being more anxious about the monetary comfort of his wife and his two sons than about the preservation of their honesty, he told the youths of the manner in which he had provided for their future prosperity by the artifice of the hole in the wall. Not long after their father's death, the sons went to the spot, crept into the treasury, and carried away enough to supply their wants for the time being. When their necessities called upon them, they went back again and again. But, in the mean time, the traps were set, and on one of their visits the elder of the brothers was caught therein! He comprehended his situation instantly, and being a bold determined fellow, called upon the younger to kill him instantly. "It is the only means," exclaimed he, "to save our mother and yourself. If when found here I am known, the whole affair will be detected, and all of us will perish at once. Therefore, since I cannot escape, and must die, cut off my head, brother, and carry it away. It will be impossible for them *then* to know me." The younger was most reluctant to obey the other's desire; but at length, with a sad heart, he did as he was requested. He then lifted his brother's head, crept out and replaced the stone, and ran home to his mother.

By daylight Rhemphus was in his treasury to discover the result of his scheme, and never, perhaps, was king or common man so surprised as when he found the headless body of a man in the trap, while at the same time no possible mode of egress or ingress was yet to be seen. The affair was ten times more mysterious than ever. Rhemphus, however, formed some hope of unravelling it by means of the corpse. This he ordered to be exposed near the spot, while at the same time he placed a band of soldiers hard by, with orders to seize any one who should express sorrow at the sight. This "weak invention" never would have brought the truth to light, as the surviving thief was too wise to take any notice of the matter; but his mother compelled him to interfere. The old lady was exasperated at the treatment of her lost son's body, and plainly told the survivor that if he did not fall on some means of bringing it away, she would go and tell the whole to the king. In vain did the youth endeavour to excuse himself: the mother knew his invention, his genius, and was obstinate. Finding this to be the case, the son bethought himself of a plan to effect his wish. Loading some asses with skins of wine, he drove them in the evening close to the spot where the soldiers were stationed, and then secretly drew out the pegs from two or three of the skins. "Oh, my wine! my beautiful wine! From Mareotis every drop of it!" he began to howl in such a manner, as speedily to bring the soldiers to his side. Instead of helping him, however, to replace the pegs, they began to drink freely from the gushing skins, as he had expected. He affected at first to be angry, but when they only laughed and made game of him, he seemed to become pacified, and to admire their drollery. Nay, in token of that admiration, he gave them a skin of wine, and helped to drink it, appearing enchanted with their merriment. The issue was, that every man became intoxicated, and in time fell asleep. The youth allowed the night to come on, and then took down his brother's body, which he put into a sack provided for it, and laid on the back of one of his asses. Being a fellow of irrepressible drollery, he could not help leaving the soldiers, and the king also, a parting token of his derision, by cutting off a portion of the whisker on the right cheek of each of the men.

When Rhemphus heard of this, he was, you may be sure, in a dreadful passion, though his admiration of the thief's ingenuity and boldness was almost equal to his anger. The old king could do nothing after these events but think and dream of that same thief. When his daughter asked him at dinner what he would like best to have, "the thief," was the usual reply. In fact, he grew a sort of monomaniac upon this subject; and had he not been the born ruler of millions, would assuredly have been heartily beaten, twenty times over, seeing that he got into such a species of dotage on this point, as at last to ask every body about him, not excepting even his prime minister, "Are you the thief—my thief?" At length he fell upon a strange plan to discover the cause of all his troubles. He commanded his beautiful daughter to receive the addresses of any man, on condition that he would tell her the most artful as well as wicked thing he ever did. Rhemphus conjectured that either the hope of marrying the princess, or the sheer audacity that seemed to distinguish him, would bring forward the rogue; and he was not

disappointed. The young thief came forward at once; but, guessing at the king's plan, he provided himself accordingly. He went on his courting expedition to the princess, and remained with her till it was dark, when, according to the plan, the young lady put the question to him. The youth replied unhesitatingly, "The most wicked thing I ever did was to cut off the head of my brother, who was caught in a trap in the king's treasury; and the most artful thing I ever did was to make the king's guards drunk, and carry off my brother's body." As soon as this answer was given, the princess, as had been arranged, seized the youth's arm, and gave the alarm that he might be apprehended. But what was her astonishment and terror, when the arm she grasped came away from the body, and remained alone in her possession, while the thief quietly glided off, and made his escape. On lights being brought, the princess found that she had a dead man's arm in her grasp!

Rhemphus was now in perfect despair. This extraordinary thief was too much even for a king to contend with. The daughter could not explain the circumstance of the arm, as the thief had appeared to her a most agreeable youth, with arms like those of other mortals. Fairly baffled, Rhemphus now proclaimed, that, if the wonderful thief would come forward, he should not only be pardoned, but rewarded handsomely. The young trickster trusted the royal word, and immediately presented himself before the king, to whom he candidly explained the whole secret of the moveable stone in the wall. "But the arm—the dead arm?" said the monarch. The youth smiled, and replied, that, guessing the princess would have orders to seize him after his confession, he had brought the arm with him under his cloak for the purpose, having taken it from the body of a person recently dead. The old king was delighted with the manners and address of the young thief. In fact, "he looked upon him (says Herodotus) as the cleverest of human beings," and gave him his daughter in marriage—an arrangement to which the young princess is not recorded as having offered any objections.

Thus happily ends the history of one of the most famous thieves of antiquity; an ending very different, indeed, from what similar practices would have entailed on the doer in these our unromantic days.

POKINGS IN ETYMOLOGY.

FIRST ARTICLE.

It is well known that the consonant *ch* is remarkable for the variety of phases it assumes in pronunciation, as, for example, *chaise*, *church*, *chaos*, *Brechin*, *yacht*. Without entering upon any explanation of these diversities, we may infer from the Proteus-like character of this letter (as it is justly considered to be in Spanish, notwithstanding its *duplicité* of form, having in that language the invariable sound it has in *church*), that the English and Scotch correlatives *church* and *kirk* are the self-same word. Now, a striking, and by no means unlikely origin, may be proposed for *kirk*, namely, the two Greek words *kurios oikos* (*kurios oikos*), "the Lord's house," which, by rejecting the mere masculine terminational index *os*, and then condensing the two words into one, may be easily contracted into the monosyllable referred to.

It often happens that the same parent word may have descendants, in different languages, where the family likeness is obscure, and indeed sometimes altogether imperceptible. This is strikingly illustrated in the word *bishop*, and its French correlative *évêque*, which have not a single letter in common, and yet can easily be traced upwards to one sole Grecian progenitor, namely, *ἐπισκοπος* (*episcopos*), meaning literally "overseer." Following the descending process, we have first, by dropping the masculine postfix *os*, the radical term *episcop*. The English word is easily derived by contracting this to *piscop*, which, through the well-known mutual convertibility of *p* and *b*, and of *sc* and *sh*, becomes *bishop*. Again, by reducing the Greek word to *episo*, or, according to French orthography, *episque*, and remembering that *p* and *v* are also exchangeable sounds, we have *evisque*, and, by a slight variation, *evésque*, the old French spelling and pronunciation, which gradually softened into *évêque*, the circumflex accent being here, as in a multitude of other words in that language, a monument to the memory of the departed sibilant, as well as an index to the *grave* sound thereby produced.

We shall perhaps excite a smile of sceptical import, in proposing to unriddle the genealogy of the grotesque expression *helter skelter*. It is evident that the movement indicated by this graphic adverb combines the two attributes of *fun* and *fastness*. Who shall deny, then, that it is a mere contraction of the Latin equivalent, *hilariter et celeriter*, "merrily and quickly!"

The verb *abandon* is a singular example of that generalisation of meaning which many words, originally restricted in their application, have gradually assumed. The French correlative *abandonner*, when thus analysed, *à ban donner*, clearly denotes "to give to ban," that is, to banishment or outlawry. The extension of this idea to the negation of social or private intercourse is strikingly natural.

Another beautiful instance of extended signification suggests itself in the word *alarm*—a feeling which in times of feudal contention would have almost daily exercise—the primitive bearing of the expression being evidently *à l'arm*! "to the arming!" This announcement or *alarm* would, by an easy process, reach its present universality of reference to all dangers whatever.

Every one knows the poetic substitute of *Chanticleer* for the uncouth monosyllable which prose has assigned to the "shrill harbinger of morn," and it may be interesting to prove the accuracy of this epithet, by pointing out its origin in *chanter clair*, expressing the "clear song" of the valorous biped.

The delightful game of chess, before which all others hide their diminished heads, is the well-known legacy of Persian intellect, and retains in its nomenclature traces of its Oriental origin. Thus *check*! the warning of attack on the hostile monarch, is simply *Scheik*! or "King!" though French gallantry has extended the intimation, at the expense of the etymology, by saying also "échec à la Reine!" Again, the fearful consummation of *checkmate*! is but the Anglified variety of *Scheik mat*! "the King is dead!"

The variation of meaning which many words undergo in their transmission to another language, invariably implies some diversity of national character or usages. Why *assiette*, which is the French term for the plate one eats off, should, in its Scottish form of *ashed*, denote the dish or common receptacle, may afford grave matter of consideration for the culinary antiquary or the philosophic historian.

Puns have often given origin to words whose singular expressiveness has gained them universal acceptance. The humorist, who, after perhaps a momentary search for some epithet appropriate to a vehicle drawn by horses not abreast, but *at length*, did *at length* hit upon the Latin adverb *tandem*, deserves to be regarded as no mean successor to the great word-manufacturer Johnson. Nor is less eulogy due to him who, anxious to give intimation that his conveyance was accessible to all, judiciously adopted for its distinctive name the Latin dative *omnibus*.

Who would not exclaim "*strange*!" if an attempt were made to trace that adjective to the Latin adverb *extra*? Yet true it is that from *extra*, "without," comes *extraneous*, whence proceeds the French *étrange*, or, in the old orthography, *estrange*, the manifest parent of its "*strange*" offspring.

Most persons must have occasionally heard the lamentations of a Scottish mother over the *stravaguing* propensities of some favourite, and consequently spoilt, child, all unconscious as she was of the classical propriety of the epithet by which she characterised them. The Latin expression *extra vagare*, "to wander from home," dropping the infinitive symbol, subsides into the radical *extravag*, from which the further process is evident.

The word *crazy* has a truly poetic origin in the French *écrasé*, implying that the mind of the poor sufferer is "shattered to pieces."

The votaries of whist, notwithstanding their predilection for *trumps*, may not generally be aware of the triumphant origin of those dignitary-cards. *La carte de triomphe*, "the card of triumph," abbreviated into *la triomphe* (though *trionphe*, in its general meaning, is masculine), will explain our meaning, and at the same time refute the supposed vulgarity of the popular pronunciation *trumps*.

The words *mayor* and *provost* are easily traced to the Latin originals *major* and *propositus*. The Spanish, who are admitted to have preserved more faithfully than any other country the pronunciation of Latin, always sound the Latin *j*, in the middle of a word, like *y*, and as their own language is written exactly as it is sounded, they read *mayor*, "greater." *Propositus*, "put over," dropping the male postfix, becomes *proposit*, then shortens to *propost*, from which, by softening *p* to *v*, we have *provost*.

The vulgar expression, "It's all in my eye and Betty Martin," or, as it has been abbreviated, "It's all my eye," has been, perhaps with more humour than etymological accuracy, traced to an invocation of St Martin by Catholic mariners, of whom he was regarded as the especial patron: thus, "*Ah mihi, beate Martine!*" "Ah me! blessed Martin!"

We next venture on a derivation, which, though it may to the majority of our readers appear fanciful and overstrained, has at least some claim to an impartial hearing. We allude to the genealogy of the word *scorn*. In Italian, as is well known, the negational prefix *dis* is elegantly abbreviated to the mere letter *s*, as in *montare*, "to mount on horseback," *smontare*, "to dismount," &c. One of the latter family of verbs is *scornare*, which, literally rendered, is to "dishorn," applied to the mutilation or abstraction of an animal's horns. This is the radical or original import of the verb, but, from the universal expansive tendency of language, it also claims the metaphorical signification of "defaming, deriding, affronting" a rational being. Hence the participial adjective *scornato*, "dishorned, or hornless, affronted, insulted," and the noun *scorno*, "shame, affront, reproach." When we recollect the importance attached in the East (of which we see many traces in Scripture) to the horn worn as an ornament on the forehead, we can easily see how the idea of being dishorned may have come to be the same thing with being degraded.

Among the numerous mistakes made by our great lexicographer regarding the etymology of English

words, perhaps one of the most unpardonable is his derivation of the verb "to rabbit" (applied to the sloping down two pieces of wood diagonally, so as to overlap each other with a view to junction), from *rabatto*, which implies "to abate, take off, or lessen," whereas it evidently comes from the French term for "a plane," namely, *rabot*, and has its exact counterpart in the verb *rabotter*, "to plane," though in this word the process of planing is not restricted to that particular application of it which is applied in rabbeting.

Who would ever dream of any connection between the words denoting the national beverage of Scotland, and the far-famed and dreaded Biscay? This, however, appears, to us at least, indisputable. The Biscayans of antiquity are still faithfully represented in their primitive language, and every other characteristic, by their descendants in an unconquered line, the present inhabitants of the Basque provinces. Now, as of old, they exhibit the same confusion, or rather identification, of the sounds of *b* and *v*, a phenomenon which is also observable in many other provinces of Spain. This singularity of articulation, combined with their ancient character as ardent votaries of Bacchus, led to the well-known pun of a Roman emperor: *Apud Biscayos vivere et bibere idem est*, "Among the Biscayans, to live and to drink is the same thing." The correct name for Biscay is *Viscaya*, which, curtailed to its first syllable, becomes *Vizc*, evidently identical with the Celtic *Uisc*, implying "water," whence *Viscaya* denotes "a maritime district." The connection between *Uisc* and *Whisky* was explained in a former article in the present work.

One admirable advantage that arises from the adoption of a foreign word which has already its counterpart or synonyme in the language, is the opportunity presented of restricting the adopted word to some peculiar application of the general meaning it has in its native tongue, and thus giving greater definiteness and exactitude to our expressions. Thus *soirée* means in general "an evening party," but is, in its English use, confined to a peculiar class of such parties. *Bœuf, mouton, veau, porc*, imply in French these animals, whether alive or in the form of meat, but in their Anglicised forms they have only the latter import. The introduction of these culinary terms is undoubtedly to be referred to the *hauteur* of the Norman noblesse introduced at the Conquest, who, leaving the Saxon boors at liberty to use their own language to denote the living animal, scorned to pollute their banquets by applying any language but French to the viands before them. The very word *hauteur* which we have just penned, supplies an elegant illustration of this restriction of meaning in imported words. The diversity of application in the exotic word from its indigenous synonyme, is amusingly seen in the inferior position which *overalls* occupy, in comparison with the more exalted locality of the *surtout*, though identical in their literal meaning.

LONDON TAVERN-THEATRES.

THE distance of many parts of the outskirts of London from the centre, where the principal recognised places of amusement are situated, has given rise, within the last few years, to the establishment of theatricals in connection with many of those suburban taverns, where from time immemorial the neighbouring citizens have been accustomed to spend their evenings with pipe and tankard. As there is something quite peculiar and London-like in these establishments, a description of one of them, apart in a great measure from all consideration of their moral effects, may not be uninteresting. We select for this purpose one called the Eagle Tavern, situated in the City Road, one of the outlets from the city towards the east.

This establishment is open every evening throughout the greater part of the year. On approaching it by the City Road, the visitor is struck with the spectacle of a large new building, elegantly constructed, and having more the appearance of some grave public institution than of a tavern. This particular edifice, however, is not yet open for the purposes of the place, being only very recently erected. The buildings now in use are behind, and are reached by a passage resembling the pit lobby of a theatre. The visitor pays a shilling here, and receives a ticket, which he retains in his possession. On passing these money-takers, he naturally expects to be ushered into the inside of something like a theatre, but finds himself, to his surprise, once more in the open air, and on looking round beholds a square enclosed by buildings, and presenting many objects worthy of his attention. The central space of ground is tastefully laid out, while beautiful busts and statues stand all around. A porticoed walk leads the visitor round this place, and he sees, by the numerous lamps hanging above him, that the walls of the encircling range of buildings are in some places stuck thick with shells, many of them of the most expensive kind usually seen on mantelpieces. Grottoes and other ornamental objects deck the place in profusion. The words "Ladies' Cloak-Room," and similar inscriptions on various doors, denote that the

rooms in this square are devoted to the convenience of visitors. Another object here is sure to arrest attention. This is a large counter or bar, attended by handsomely dressed females, and provided with all the means of refreshment and comfort. Such are the main points that meet the eye in walking around this court.

At the corner opposite to that by which he entered, the visitor finds the entrance-door of the Grecian Saloon, or, in other words, of the real Tavern-Theatre. This is a spacious apartment, containing boxes, pit, orchestra, and stage, disposed as in ordinary theatres. Nothing can be more elegant than the style in which the whole is fitted up and decorated. The walls and wood are beautifully and variedly painted; the boxes are splendidly papered in the backs, the seats richly clothed, and large mirrors are hung up at the ends nearest the stage. The chandeliers, &c., are in the same expensive taste. The stage is small, and differs in no respect from the stages of common theatres. But in the arrangements of the pit, the peculiar characteristic of the place becomes strikingly visible. In front of each seat there is a narrow level table, supported by being fixed (as in church pews) to the back of the preceding one, and adapted for the reception of whatever liquors or refreshments the visitors may choose to solace themselves withal. And a most strange and novel sight it is, when the house is filled with spectators, to behold each man sitting at his ease, with his pot of foaming porter, or his glass of hot gin-and-water before him, coolly discussing at the same time his cigar, or inhaling the fumes of his foot-long pipe, and all the while observing with critical eye the performances on the stage in front, and rewarding them ever and anon with his *bravo* and *encore*, or condemning them, as it may be, with his *psha* and other tokens of disapproval and dislike. The expression of voice and countenance of a real lover of such exhibitions, jolly in person and well-to-do in general appearance, when he is seen in such an attitude and position, gives one an idea of superlatively luxurious ease, which it would be impossible to exceed. Some may be inclined to think that noise, confusion, and disturbances of every sort, must be apt to arise from the existence of such a degree of licence, and such a species too of licence; but this is a mistake, as regards the Eagle at least, and other houses at the top of this order of establishments. Judging from one or two visits, the people who frequent the Royal Coronation, &c. &c., City Road, are by no means of a disreputable class. The majority of visitors upon the whole are young, as might be expected, and seem to belong to the race employed in sale-shops and work-shops, but there are also many stayed-looking, middle-aged personages to be seen there, whose amplitude of girth and comfortable aspect at once distinguish them as having for no short time enjoyed all the advantages of being their own masters. In short, many decent shopkeepers do not disdain to please their eye at the Eagle, while at the same time they luxuriate over their hot tumbler, or their pot of stout, and their pipe. For this they only pay one sixpence more than a visit to any other tavern would have cost, as the check or ticket which is received by every visitor on entrance, entitles him, at any period of the evening's entertainments, to call for whatever refreshment he pleases to the value of one sixpence. Most people content themselves with imbibing this moderate and legitimate quantity of liquor, whether it be in the shape of wine, spirits, porter, or ale, but further payments will procure additional supplies. One of the most amusing things attending a visit to such a place as this, is to witness the variety of tastes displayed by the people. Attentive waiters are sliding or gliding about in all directions among the benches—most commonly during the intervals of performance—to receive the commands of the visitors, one of whom will call for a glass of gin "neat" (unmixed), another gin and cold water, another gin with cold water and sugar, and a fourth gin with hot water and ditto. So also with all the other species of liquors.

Such is the state of matters in the pit. We have as yet said nothing of the boxes, which form the usual resort of the female visitants to these entertainments. The same sum of money (one shilling) constitutes the admission to the boxes, or, as they are called, the *family stalls*, but no refreshment is here included. Indeed, refreshments do not seem to be taken (for the most part at least) in these stalls, though smoking goes on there as well as in the pit. It may be thought that this would be sufficient to exclude respectable ladies from the place, and indeed we do not say that females of the more respectable orders do go to these entertainments, but, at the same time, it would be casting an unfair reproach on all concerned, to say that no respectable women of the middle and humbler classes are ever visitants to the establishment. In reality, well-dressed family parties are to be seen in the stalls, and it is amazing, under all the circumstances, how little such persons find there to offend either eye or ear. The convivialities seldom occasion any interruption to the performances, ordering and chatting being generally managed in the intervals; and the building is so roomy, that the smoke from pipe and cigar passes off without any very disagreeable impressions upon the nasal organs, into the well-ventilated regions above.

The performances at the Eagle Tavern-Theatre consist chiefly of *concerts, little musical dramas, and dancing*. This description will appear sadly dull, curt, and imperfect, when compared with the following announcement in the nightly bills of the place, which we copy accurately, points of admiration included. This summary of sights alludes, as may be seen, to the

pleasure-grounds without, as well as to the exhibitions within. "To attempt a description of the numerous and varied sources of Entertainment given at this splendid place, within these limits, would be vain. The Royal Victoria Pavilion! Dancing! And Vaudeville! Set Painting! Cosmoramas! Fountains! Grottoes! Dripping-Rock! Elegant Buildings! Arcade! Colonnade! Grounds! Statuary! Singing! Music! And other Delightful Amusements! render it a Fairy Scene, a due Estimation of which can only be formed by Inspection!" With respect to the in-door portions of this high-sounding roll of entertainments, the concerts, with which the evening amusements usually commence, are really well worthy of attention. The orchestra equals that of many of the minor theatres, and overtures from the best masters are executed in no despicable style. One or two such pieces from the band, and perhaps eighteen or twenty songs from various performers, male and female, make up the evening's concert. These singers, as might be expected, exhibit various degrees of ability. Some of them are persons who have been regularly trained to the stage, but whom misfortune, and error (it may be) in some cases, have caused to quit the regular theatrical boards. The want of a good figure alone often brings singers to the Eagle and similar places, whose abilities would otherwise have entitled them to the very highest rank in the profession. In addition to such persons, and others from the minor and provincial theatres, there are no doubt many whose talents lie chiefly in their own estimation,

"Young clerks, foredoomed their fathers' souls to cross,
Who bawl 'Tom Bowling' when they should engross,"

and who find it more easy to make spectacles of themselves at such places as those under consideration, than at houses of higher note. What with one class and another, people get very good songs as well as very so-so ones at these concerts. The dancing is almost always good, and the musical dramas very respectably managed. Overtures and singing commonly conclude the exhibition as they began it.

Such is the style of the public amusements which the inventiveness of luxury has enabled the Londoner to enjoy, while sitting in some measure in private over his pipe and pot. The idea of such establishments could only have been conceived in a vast city like the British metropolis, where the caterers for the general entertainment incessantly rack their brains to discover new and varied modes of pleasing. If it be thought that in noticing this Eagle establishment, and in commending the beauty of the buildings, as well as the comparative decency of the whole exhibition, we have meant to express an approval of the principle of tavern-theatres, our object has been misunderstood. A tavern, under whatever guise it may present itself, does not seem to us to be a proper place for passing leisure time in, but we do not scruple to confess that we like a tavern all the better for mingling harmless spectacles with less approvable objects. It is at least a step in refinement to have a taste for pleasing some other sense than the mere gross appetite for drink. It must be remembered, however, that the preceding description only applies to the higher species of tavern-theatres, among which the Colosseum (the most respectable, perhaps, of all houses of the kind), White Conduit House, and others, may be ranked, as well as the Eagle. Tavern-theatres are to be found in London, of a description immeasurably inferior to those mentioned. Any person who steps into one of these out of curiosity, will find himself planted in one of a row of benches which fill up the body of a common room, nearly if not altogether devoid of any such appendages as boxes. In fact, the place resembles a common taproom, with this difference, that at one end of the apartment there is a small stage for the performances. The walls are dingy, and the atmosphere is thick with smoke, emitted unceasingly from the long pipes of tradesmen in their working-clothes, draymen with their frocks, and even dustmen with their hats shoved behind. Porter and unqualified gin form the choice liquors. On the stage there appears a company of performers, by no means very scanty in numbers, but deplorably at a loss for fit attire when the parts of real gentlemen and ladies are to be enacted. The favourite exhibitions here, however, do not render this deficiency very observable. Jim Crow (done by the help of the best soot), Dusty Bob and Black Sall (duet in character), Does your Mother know you're Out? Such a Getting up Stairs! and other such songs, are the current delights of the inferior tavern-theatre. But it must not be supposed that the managers profess to present nothing but vulgarities like these. For persons of more refined taste than the before-mentioned orders, the bills of such houses of entertainment present most attractive food. One of these bills, now in our hands, seems in many points to be a most excellent though unintentional caricature of the operative bill-cant of the day. "Mr Albert Hookey (of the Nobility's Concerts) will preside at the Grand Panarmonion." [This instrument used surely to be named Panharmonicon!] Then on this Panarmonion, which supplies the place of an orchestra, we are to have the "Overture to Semiramide," and afterwards the "Overture to Artaxerxes." Then we have "Russian Cracovienne dances," "Grand new Musical Ballets of Action," and all such mysteries, in abundance—mysteries at least, certainly, to the gentlemen of the pot and pipe, for whose critical beholding they are especially intended. Clog hornpipes, also, it may be observed in conclusion, are performances of a vastly popular character.

Take them all in all, these tavern-theatres, whether

pernicious or otherwise in their tendency, are curious and interesting as instances of the inventive skill of modern luxury. The capital which the proprietors of some of these places have embarked upon them, is immense. But the return is derived in many ways besides the mere receipts of the evening entertainments described. The Eagle Tavern, for example, attracts many visitors by day, who desire to see the pleasure-grounds and decorations around, and, at certain seasons, fire-works, small balloons, and other pageantries, attract great crowds. At the Colosseum, also, there are daylight exhibitions, which are well attended. Mr Braham, the celebrated singer, is the manager, if not proprietor, of the Colosseum, and his name is sufficient testimony that tavern-theatres are not necessarily disreputable places.

GRIMALDI AND HIS WIFE—A CASE OF POISONING.

I cannot refrain from telling a story, which I know to be true, of the oldest Grimaldi, the first of the race. Grimaldi and his wife were occasionally in the habit of quarrelling. At length their feuds assumed a very serious aspect; and after communing together upon their most miserable state of "incompatibility of temper," they resolved to destroy themselves, as the only means of relieving themselves from their most miserable condition. In accordance with this most extraordinary resolution, Mr Grimaldi proceeded to an apothecary's shop in the neighbourhood, and asked for an ounce of arsenic "to poison de rats." The "culler of simples" obsequiously bowed, and delivered to the devoted Grimaldi the dose that he trusted would emancipate him from all worldly ills. Firm to their purpose, the illustrious Punch and Judy swallowed in tumblers of water, each a moiety of the deadly "drink," and then embracing, retired, one to their hymeneal bed in the bedroom, and the other to a sofa in the sitting-room—both rooms communicating—the door between them being left open. The pair of suicides lay down, tears filling their eyes; a long and solemn pause ensued—no sound of groans, no sigh of anguish was heard—all was still as night. At last, wearied out with expectation, Grimaldi raised his head from the pillow, and in the deepest possible tone of voice cried out, "Mrs Grimaldi, are you dead, my love?" Upon which Mrs Grimaldi, in the highest possible squeak, replied, "No, Mr Grimaldi." The rejoinder sounded something like "Dom;" what it meant, the imagination of the delicate reader may supply. At the end of another half hour, it became Mrs Grimaldi's turn to be anxious as to the success of the potion, and she, hearing nothing in the next room, raised herself in the bed, and said in her squeak, "Mr Grimaldi, my dear, are you dead?" To which the gruff reply was, "No, Mrs Grimaldi." And for two hours these questions and answers went on periodically, till at last, the lady's turn coming again, she repeated the inquiry in a somewhat more excited and exalted tone, and almost screamed out, "Mr Grimaldi, my love, are you not dead?" "No, my dear," said Grimaldi, "I am not; nor do I think I can die to-night, unless it be of starvation, Mrs Grimaldi; get up out of bed and see for some supper, for I am very hungry." So ended this fatal performance; the apothecary, who had heard of the perpetual bickering of Punch and Judy in their *menage*, having prudently given him a small parcel of magnesia, which the unhappy pair had divided between them.—*New Monthly Magazine*.

THE BEAR AT SCHOOL.

The private journal of a traveller lately returned from North America to Paris contains the following story. In New Hampshire, on the northern borders of the United States, a peculiar species of bear is found, black in colour, small in size, and in general of a peaceable disposition. These animals live on wild honey and fruits, and never attack man or the lesser animals excepting when pressed by hunger in the very severe winters. On one occasion, some years ago, a boy found a very young bear-pup near Lake Winnipeg, and carried it home with him. It was fed and brought up about the house of the boy's father, and became as tame as a dog. Every day its youthful captor had to go to a school at some distance, and by degrees the bear became his daily companion. At first the other scholars were shy of the creature's acquaintance, but ere long it became their regular play-fellow, and they delighted in sharing with it the little store of provisions which they brought for their day's sustenance in small bags. After two years of civilisation, however, the bear wandered to the woods, and did not return. Search was made for him, but in vain.

Four succeeding years passed away, and in the interval changes had occurred about the school alluded to. An old dame had succeeded to the ancient master, and a new generation of pupils had taken place of the former ones. One very cold winter day, while the schoolmistress was busy with her humble lessons, a boy chanced to leave the door half open on his re-entrance, and suddenly a large bear walked in. The consternation of the old lady and her boys and girls was unspeakable. Both schoolmistress and pupils would fain have been "abroad," but the bear was in the path, and all that could be done was to fly as far off as possible, and hide behind the tables and benches.

But the bear troubled nobody. He walked quietly up to the fireplace, and warmed himself, exhibiting much satisfaction in his countenance during the process. He remained thus about a quarter of an hour, and then walked up to the wall where the provender bags and baskets of the pupils were suspended. Standing on his hind feet, he then took hold of these successively, put his paws into them, and made free with the bread, fruit, and other eatables there contained. He next tried the schoolmistress's desk, where some little provisions usually were; but finding it firmly shut, he went up again to the fire, and after a few minutes' stay before it, he walked himself finally out by the way he came.

As soon as the schoolmistress and her pupils had con-

rage to move, the alarm was given to the neighbours. Several young men immediately started after the bear, and as its track was perfectly visible in the snow, they soon came up with it, and killed it. Then it was, that, by certain marks upon its skin, some of its pursuers recognised in the poor bear no enemy, but an old friend of their own recent school-days. Great regret was felt for the death of the creature. It was like killing a human friend rather than a wild animal.—*French newspaper*.

CLASSICAL EXAGGERATIONS.

Some of the scenes in the kingdom of Naples, of which Virgil, in his *Æneid*, makes so much, are thus described in the language of soberness and daylight by a late visitor:—The Lucrine Lake is now a paltry pool, scarcely equal to a mill-pond. Lake Avernus has lost its woods, and is despoiled of the deep gloom and brooding vapours which made it a fit outwork of Virgil's hell. As a matter of course, I visited the cavern by which *Æneas* is supposed to have passed to the nether world. It is a straight tunnel, ten feet high, cut artificially in the tufa, passing through the narrow ridge two or three furlongs in length, and nearly level. About one hundred yards from the farther end, a very narrow gallery leads off to the right; it descends rapidly for two hundred feet, and conducts you to a pool of water. As this ought to be the river Styx, I looked for Charon, and kept my ears open to catch the growl of Cerberus, and the shrieks of unquiet ghosts. The surly boatman, however, seems to have retired *a ses terres*, and left the charge of the ferry to three or four of his sons, a race of sturdy unshaven bare-legged savages. The Styx, too, has shared the fate of many other subterranean rivers, having grown so shallow that the Charonides or Fitcharons have laid aside the bark, and carry disembodied spirits across on their shoulders. They pressed me much to make the journey; but not being guarded by spells like *Æneas*, and having some doubts whether the Fitcharons were a race "to ride the water on," I refused. One of our party, however, passed over, and returned in a quarter of an hour. After being immured for about half an hour, we returned to the upper world with our torches, and found it much less difficult *renovare gradum* than Virgil would have us believe. They have an *Acheron* here too, a *Mare Mortuum*, and *Elysian Fields*; but it would require moonlight and a strong faith, to see any thing mystical or submundane about them. The Grotto of Posillipo, a magnificent tunnel two-thirds of a mile in length, sixty feet high, and broad enough to serve for a highway, is a much more interesting object. It was cut by the early inhabitants before the commencement of Roman history. Baia is a beautiful spot, but the ground capable of being built upon would not afford room for a dozen of handsome villas.—*Scotsman newspaper*.

INCITEMENTS TO GOOD CONDUCT.

Finding remonstrance of little effect, Francia (Dictator of Paraguay) erected a special gibbet. In came, according to custom, one afternoon, a poor shoemaker, with a couple of grenadiers' belts, neither according to the fancy of the dictator. "Sentinel!" said he, and in came the sentinel, when the following conversation ensued:—Dictator: "Take this bribonazo (a very favourite word of the dictator's, and which, being interpreted, means 'most impertinent scoundrel,') take this bribonazo to the gibbet over the way; walk him under it half a dozen times; and now," said he, turning to the trembling shoemaker, "bring me such another pair of belts, and, instead of walking under the gallows, we shall try how you can swing upon it."—Shoemaker: "Please your excellency, I have done my best."—Dictator: "Well, bribon, if this be your best, I shall do my best to see that you never again mar a bit of the state's leather. The belts are of no use to me, but they will do very well to hang you upon the little framework which the grenadier will show you."—Shoemaker: "God bless your excellency, the Lord forbid! I am your vassal, your slave; day and night have I served and will serve my lord; only give me two days more to prepare the belts; y por el alma de un triste zapatero (by the soul of a poor shoemaker) I will make them to your excellency's liking."—Dictator: "Off with him, sentinel!"—Sentinel: "Venga, bribon; come along, you rascal."—Shoemaker: "Senior eccellentissimo, this very night I will make the belts according to your excellency's pattern."—Dictator: "Well, you shall have till the morning; but still you must pass under the gibbet; it is a salutary process, and may at once quicken the work and improve the workmanship."—Sentinel: "Vamonos, bribon; the supreme commands it." Off was the shoemaker marched; he was, according to orders, passed and repassed under the gibbet, and then allowed to retire to his stall. Whether the electric shock which he had undergone strung his nerves anew, or whether his genius was quickened by a keen perception of the danger of being a sloven or an ignoramus in a vocation so important as that of beltmaker to his excellency, it is very certain that the shoemaker appeared the next morning before Francia with a couple of belts, so entirely to the dictator's fancy, as to save the operator's neck from the halter, and to procure for him the station of beltmaker-general to the army. The example was so salutary, that blacksmiths, gunsmiths, architects, tailors, tambourers, cap-makers, all became better tradesmen. The "tradesmen's gibbet" was the terror of them all, and a single peep at it, even in the distance, sent every man home to his respective calling, with a combination of alacrity, fear, and dexterity, which I doubt much if any other stimulus, however exciting, would have produced.—*Robertson's Francia*.

DISEASE AMONG SHELL-FISH.

A writer in an American Journal of Science mentions a circumstance remarkable enough to be quoted. He says, "One of the most curious phenomena of the year 1836, has been the fatal effect of an epidemic disease among the molluscous animals or shell-fish of the Muskingum river, Ohio. It commenced in April, and continued until June, destroying millions of that quiet retiring race which peoples the beds of streams. As the animal

died, the valves of the shell opened, and, decomposition commencing, the muscular adhesions gave way, and the fleshy portion rose to the surface of the water, leaving the shell in the bed of the stream. As these dead bodies floated down the current, the heads of islands, masses of fixed drift-wood, and the shores, in many places were covered with them, tainting the air in the vicinity with putrid effluvia. The cause of the disease amongst the shelly race remains as much a mystery as that of the Asiatic cholera amongst the human family."

OMNIPRESENCE AND OMNIPOTENCE OF LAW.

If you leave your home to take an airing, you may walk in security on the side-walk of the street, because you know that no rider will disturb you. Who or what prevents the people on horseback from making use of that part of the public road? The law; or, if they were to disregard it, certain officers—that is, men invested with authority likewise by the law, who have been charged to enforce this among other laws. This law then protects you. You proceed farther, and find these words on the signboard of a bridge, "Keep to the right, as the law directs," addressed to those who guide a vehicle. It is a law which commands something. You may pass an orchard with inviting fruits; the fence surrounding it might be easily scaled, and you feel an urgent impulse to slake your thirst with the juicy apples before you; yet you must not do it. Were you to follow the dictates of your desires, though most natural and perfectly innocent, the law would punish you; because it protects the orchard as the property of some one else. The law is made already, and thus it warns you. A decrepid and poor man is prevented by certain officers from asking those persons who show by their dress that they live in ease, to give him from their superfluity that which he is unable to obtain by his own exertions; he is taken to a house designated by the law as a home for those persons who cannot earn their living. You sail on the vast ocean, at a great distance from all society; a man-of-war, perhaps belonging to a different nation, thousands of miles from your own, bids you to lie to and show your colours. An officer comes on board your vessel, asking for your papers, and requesting you to go with him on board his own. If you refuse to comply with his request, you expose yourself to vexations, perhaps to danger. It is the law of your land, and that observed among nations, which obliges you to provide yourself with those papers, and to produce them under these circumstances. In a foreign port, a consul of your own nation advises, and, if need be, protects you. The law directs him to do so. You see an individual depriving another of his life, violently and considerately; yet nobody attacks the one who kills, or rescues the other doomed to die, because the law has decided that he should die in this manner; it is an execution. The law establishes schools, and obliges parents to send their children to them. The law assists a poor man to obtain his dues from a rich one; and again it protects the rich, so that the poor shall have no more than their due. A single individual says the harshest things of those in power, yet no one molests him, because the law has said that he may do so; and again, there are laws which all or nearly all dislike, or declare unprofitable, nay, even cruel, and yet they are obeyed unaided by physical force. The law has built highways, united rivers, severed mountains; it takes away property for the public benefit, and protects it; sends expeditions into remote regions; has founded libraries and collections of works of art; adorns and beautifies. The law takes care that the merchant measures with a true yard-stick, and tells him in what money he must pay his debts: it condemns unwholesome food, prohibits your having more than one wife, punishes public immorality, interferes if your occupation disturbs or annoys others, obliges you at times to take up arms, at others it prevents you from using them to avenge the most signal injustice, and at others, again, it permits you to use them. What then is this law, invisible, yet seen in its effects everywhere? * * * Which accompanies me wherever I may go, penetrates into all relations of men to men, to animals and things, and, what is most remarkable, is never intermitted or suspended, but continues to act, and every day creates new rules and regulations for man's conduct and his various relations; and with unceasing and inexhaustible energy seizes upon every new condition of men or things that may spring up?—*Lieber's Manual of Political Ethics*.

QUARRELS.

A contest, however long and inveterate, is at no period so likely to be brought to an amicable adjustment as when both parties are satisfied that they have maintained bravely their part of the quarrel, while each, at the same time, feels respect for the courage and force of their enemy.—*Genius and Wisdom of Sir Walter Scott*.

JEFFERSON'S TEN RULES OF LIFE.

The following rules for practical life were given by Jefferson in a letter of advice to a friend in 1825:—

1. Never to put off till to-morrow what you can do to-day.
2. Never trouble others for what you can do yourself.
3. Never spend your money before you have it.
4. Never buy what you do not want because it is cheap.
5. Pride costs us more than hunger, thirst, and cold.
6. We never repent of having eaten too little.
7. Nothing is troublesome that we do willingly.
8. How much pain have those evils cost us which never happened.
9. Take things always by their smooth handle.
10. When angry, count ten before you speak—if very angry, count a hundred.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

PRICE THREE HALFPENCE.

A DAY IN THE COUNTRY.

BY MARY HOWITT.

WHAT a great deal of pleasure is enjoyed every day by thousands of people who are nevertheless unaware that it is pleasure at all! It is a great mistake to think that that only is pleasure which costs much money or great pains-taking. Pleasure is an every-day thing; it lies within ourselves, and round about us, if we would but stoop to gather it; for the truest happiness is made up of the simplest elements. For example, a stroll in the country, an unambitious evening spent with unpretending people, cheap every-day things as these are, often furnish us with delicious recollections for years. Thank God, there is no man so humble, but if he have a common share of intelligence, he may find pleasure even among furze-bushes. I will describe a day spent in the country, which is vivid in my own recollection, as a practical illustration of my assertion.

We were in the country—not the country of many Londoners, who call a provincial town containing perhaps a hundred thousand inhabitants, country; but real, unmanufacturing, unroad-traversed, corn-growing, cattle-feeding, cheese-and-butter-making country, ten miles at least from any town, and in the very heart of a rural district. Our abode, too, to make it more complete, was in a farm-house—not a large farming establishment either, where a thousand acres or more are in the hands of one man, who bears the style and title of esquire, drives his curricle, and rides a-hunting. No, our farmer and his abode were of the old fashion—a jolly comfortable man was he, no whit above his calling, and with a wife his counterpart in all things, whom he always designated as his "missis." The farm-house itself was a clean-windowed, fresh-painted, well-conditioned abode, but where, it must be confessed, the hall-door was mostly barred and bolted, and the clean, white, and smartly-fringed blinds of the best parlour only drawn up when guests were there, or on Sundays, when guests might be expected. It was too busy a place—there was too much milking and churning, cheese making and pressing, for people to have much time to walk in and out of front doors, or to sit in best parlours with blinds up; yet, nevertheless, it was a cheerful place; and the ease and regularity with which even labourers' work was done, insensibly filled the mind with agreeable ideas of industry and success.

Nor was the garden of the farm-house a despicable one, with its neat gravel-walks and well-mown grass plot, with its thrift-edged borders full of old-fashioned flowers, pinks, sweet-williams, lychnises, hollyhocks, cabbage-roses, and white lilacs; and at the end of a long straight walk, which divided the garden into two equal parts, its deep and shady arbour, on each side of which grew a white rose tree, not bush, in full flower. A cool and pleasant place was this arbour, with its rude bench and paved floor, its soft, subdued light, its twittering of birds, and the never-ceasing hum of bees and insects, that found food or amusement among the leafy, lopped, and twisted branches of the stunted lime-trees that formed its sides and roof. A pleasant place this for the farmer's fair daughter to be wooed in, or for the farmer to smoke a pipe or read his weekly paper in; only that farmers, good honest men, prefer a chimney corner, and an armed chair, to take their indulgences in; and the arbour, after all the pains that are taken with it, is a piece of state, a thing to be looked at and admired rather than used, unless, indeed, by occasional guests like ourselves, who sat in its quiet shade for hours, reading of Rosalind and the forest of Arden, and all the sweet and grotesque fantasies of the *Midsummer Night's Dream*, till the formal arbour, and the farmer's garden, became all one rich world of poetry.

The house itself was a large and rather rambling one, with wainscoted rooms and great bow-windows, and long stone-floored passages with a step up or a step down at every door to which they led. The best parlour

was painted white and blue, and was carpeted with green and red. It was furnished with a profusion of tables, chairs, and commodious chintz-covered sofas, well cushioned, and large enough in all conscience for beds. There were prints and paintings, suspended by red ribbon, on the walls—the great Durham ox, the famous Leicestershire ram, and a Lord Somebody, a once popular member for the county; and portraits of the farmer and the farmer's wife, done in oil by some provincial artist thirty years since—he in his blue coat, pink-striped waistcoat, and best frilled shirt; she in a lilac silk gown, short-waisted and tight-skirted, with a habit-shirt and lace-cap, adorned with bows and puffings of green ribbon. Wonderful likenesses were these, as the artist had protested; wonderful, as the loving pair had tried to persuade themselves, spite of the eyes that squinted, the brick-dust complexions, and the stiff hands of a ghostly whiteness: wonderful likenesses, of a truth, hung up in heavy gilt frames, defended from the flies by yellow gauze, and ornamented at the top with peacocks' feathers. Nor must the "chimney-furniter," as the good farmer called it, be forgotten—the Jenny and Jenny Jessamy smiling properly in dainty china; the ewe and two lambs under a pink hawthorn tree, with a companion-pair of goats browsing; a yellow rose-bush, and, as a centre-piece, Sterne's Maria, with her pipe, dog, and blue ribbon.

Such was the best parlour; but then the best bedroom! Who knows not the fresh, clean luxury of the farmer's best bed room, knows not a good thing! First, then, is the clean green paper on the walls—green it must be, for country folk have a great penchant for green walls; perhaps they think they contrast well with ruddy complexions. Then the white and well-fringed dimity curtains; the old-fashioned bed, with the white hangings to match; the mahogany posts rubbed bright, and black as ebony; the two feather-beds filled to the most elastic softness by the farmer's wife, with the primest feathers of her primest geese, and the full complement of down pillows; then there are the delicately lavendered sheets, and the spotlessly white counterpane, ten to one, of some antique fabric! Through the half-closed curtains of such a bed one may lie at one's ease, and see the old-fashioned heavy chairs, with their dimity-covered seats; the nice little well-appointed dressing-table, with its tall dressing-glass; the old walnut-tree wardrobe, as bright as glass, yet guiltless of French polish; and the white-painted mantelpiece crammed with old china, shells, imitation cottages, and pasteboard spill-stands, out of which droop bundles of feathers and quaking grass, lavender and yellow everlasting.

Such is the farmer's best bed-room, and such, for the time being, was ours. The reader, I am persuaded, will believe that a sojourn in such a house, taking moreover into account abundance of good fare, and the most cordial welcome, at the beginning of a remarkably fine July, was no unpleasant thing. We came abroad for enjoyment, and enjoyment we found. If we had our own particular cares and anxieties—as who has not!—for that time at least we left them behind; and as to how in how great measure pleasure is dependent on ourselves only, and how it is scattered, as it were, at our very feet, I will give one day as a specimen of several.

At breakfast we began to consider how the day was to be spent. One of us had had an ungratified desire for ten years to visit the little neighbouring village of Winston. Winston! every body had exclaimed for ten years, and what is to be seen at Winston? It was averred to be a place to which nobody ever went, from which nobody ever came; it was a world in itself; it was the very world's end; there was no road through it; it was famous for nothing. On this present occasion the farmer argued that it had no market, and the farmer's wife that it had no shop. What could be our inducement to go to Winston? "But it has a hall," we suggested. "Yes," was the reply, "a hall known there as 'Winston-oud-ha'; but it has not even the

dignity of being in ruins, and the squire's family has not been there for twenty years." Well, it must be haunted, then, and at all events a ghost story was worth going five miles for. No, no; they did not believe there was even a ghost—the Winston people were hardly sharp enough to see ghosts. Thus at Winston there was nothing to be seen; it was a place only to be described in negatives. A spirit of contradiction grew strong within us, and we determined to see the place in which nothing was to be seen. At all events, there was sunshine, the delicious air of a July day, and leafy trees and green fields, at Winston. The good farmer, hopeless in our pertinacity, quietly demurred to himself as to whether we should even find these things. The pony, however, was saddled, and the two children mounted upon it, for we determined they should go with us; and in very picturesque style, like Joseph and Mary journeying on to Egypt, we set off. The last words of the farmer, "You'd better take the road to Eaton-basset, the first turn to the right," sounded in our ears as we turned into the highway; but we disregarded his monition, and took the little green lane to the left, that led us towards Winston.

We went on for some time through this deep lane, and then by a bridle-road through farm-fields, where cows were grouped together as in pictures, presenting, as those animals always do in summer, the completest images of quadruped luxury which the country affords. You cannot see horses, not even a mare and her foal, without a sense of the labour to which they are doomed. A flock of sheep is beautiful, especially when lambs are amongst them; but sheep and lambs instinctively remind one of mint sauce and boiled turnips, and the pastures on which they feed have a dry, barren-looking herbage. Very different is it in the abounding richness of a dairy-farm; their luxurious fare is a proverb—they live in clover—they rise up and they lie down in the very fatness of the land. When we see them, it is not to think of horse-radish and oyster-sauce, of mustard and shalots, but of rich cream and curds, of syllabubs and custards; the very creatures themselves, as they stroll leisurely along, or lie in the deep grass chewing their cuds, seem as if they blessed themselves that they had no burdens to bear, as if they themselves revelled in their own cream and butter.

Leaving these abundant fields, we came to the summit of the ridge that had hitherto bounded our prospect; and here we found a silent spot—a little field of graves. A small chapel stood at one end of it, and a few weather-beaten tall elm-trees marked it out conspicuously to the country round. It was a singularly lonesome spot; a meeting-house and burial-ground, as we found, of the Society of Friends—one established in the very early times of the society, where George Fox and many of the "ancient worthies" of that singular people had preached, and drawn together a little flock, as it were, in the wilderness, and where their descendants still assembled for their silent worship, and to bury their dead. From this spot we looked into a small rich valley crowded with wood, and with here and there an old-fashioned greystone farm-house, lying "warm and low," the picture of rural seclusion. In the centre of the valley, from the very bosom of woodiness, rose the low grey tower of the church of Winston, the village itself from that point being quite hidden. An exclamation of delighted surprise burst from us, "How beautiful, how quiet! The very place for the home of a rural poet!"

Our path was again by a deep country lane, with high green banks, and overshadowed by full-grown hedgerow timber, and adorned with a profusion of wild roses and honeysuckles. It was impossible to pass such a display of flowers without possessing ourselves of many, and, literally, in the words of Solomon, "we garlanded ourselves with roses, and let no flower of the summer pass by us." Lower and lower we descended by this woodland path, and still the nearer we approached the village, the more secluded and apparently less trodden it

appeared. It seemed true, what they told, that nobody came or went to Winston—that it was a world within itself. We thought of it in its deep retiredness, lying thus, winter and summer, completely out of the track of busy life; and then we thought of noisy crowded towns, to which fifty roads point as to a centre, all astir with the activity of commerce or pleasure, and of the bustling, struggling, suffering, and impatient thousands who congregate together, and call themselves society. What a contrast!

We came at length to the level of the valley, and to within a field's breadth of the church. A path wound through the field, a pleasant "church-going road," by the side of the little valley stream, whose margin was bordered by a thick luxuriant growth of water-plants, and presently brought us, by a short cut, to a gate, overshadowed with lime-trees, in the churchyard wall. We tied the pony to the gate, and then entered, as is the wont of all tourists and rural perambulators whatsoever, upon the domains of the dead, to gain from their memorials some idea of the living. The common run of epitaphs seemed to have found their way to Winston, whatever way they might have travelled. One particular in the inscriptions, however, we soon remarked—the extraordinary number of aged persons whose deaths they recorded; it seemed as if these out-of-the-world people were blessed with a primitive longevity. To the tenant of one grave, it was stated that "Death had come as a thief in the night;" yet it was recorded that he had attained the age of eighty-seven! Another, who was a musician, was said to have had "his sublunary destiny cut short" at the age of ninety-three! A stone mason and his two wives, with all their numerous virtues, lay under one stone, and the youngest of the three was seventy-five! While we were remarking this singular fact of longevity, another struck us: there seemed to be but four or five names in the whole churchyard; evidently the people of Winston had all sprung from the few original inhabitants, and they had married and intermarried among themselves. It was not without reason that Winston was said to be a world of itself.

As there was a hall in the village, of course there was a monument in the church. It was a rare piece of sculpture. A knight and his lady in the full court dress of Queen Elizabeth's days, in kneeling attitudes, with upturned eyes and open prayer-books in their hands, all coloured to the life, with red cheeks and lips, both knight and dame seeming in the full floridity of health and strength; probably a practical comment on the text inscribed at their feet, "In the midst of life we are in death." Both these dignified persons' ages, however, like those of their humble neighbours outside, seemed more aptly to illustrate another text inscribed also below, "They were as sheaves of corn fully ripe," for he was eighty-nine, and she seventy-nine!—Sir John Winston of Winston, and Dame Penelope his wife. The tomb was said to have been erected by "their dutiful and loving son, Sir Christopher, in memory of their many virtues, and his irreparable loss. Sir Christopher," it said, "survived the building of this tomb only three years, and himself was interred therein." Sir Christopher was the last of the Winstons. His only child, a daughter, married one Oliver Charteris, Esq., and in a branch of the same family the estate still continues.

Having seen this tomb of the worshipful knight and his lady, and of the dutiful Sir Christopher, their loving son, we were next desirous of seeing the house of their living greatness. "Winston-oud-ha," for so it was called, though we could find no new one from which it was thus to be distinguished, stood conspicuously in the village, and with one side adjoining the churchyard. It was an old brick building, extremely tall, with numerous gables and well-grouped massive chimneys. We passed between the pillars of its ancient gateway, for the gate itself had long been gone, and found a wilderness of rubbish and rude erections in its courtyard. Cart-hovels were raised against the walls; old ploughs, broken gates, and incapacitated wheels, together with useless timber and old straw, lay scattered about in the most desolate confusion. The flight of stone steps which led to the principal entrance was broken, and the large door was weather-beaten, and apparently kept together by such rude carpentry as the occupant himself could render. The whole of this front seemed disused, for the windows were fastened up in a great variety of ways. In its present estate, this evidently was the back of the house. As we saw not a single human being about, we made a complete circuit of the place, menaced on all sides by dogs, great and small. The inhabitants, as we were told by an old woman in an adjoining cottage, were all engaged in the harvest fields, and the house locked up. We inquired of its interior, but could gain no information; like all that appertained to Winston, it was told in negatives. "There was nothing to be seen," she said; "it was a great *gastous* place; but, indeed, nobody ever went into the big rooms; the steward had the keys, and nobody now-a-days went into them." After this we walked through all that remained of a once large garden, which was now scarcely more than a wilderness of weeds, and then turned from "Winston-oud-ha" with somewhat dissatisfied minds. At Winston they told us truly that there was nothing to see, and they might have added also, *nobody* to see; for such was the fact on this day, the whole population having apparently deserted their dwellings for the harvest field.

Very much amused by having had the nonentity of Winston so fully realised, we wandered again up the pleasant lane by which we had descended, and before long

found that the full splendour of evening was covering every little western hill with a flood of glorious light. From the woody ridge, where the little chapel stood, we took another road, in order to diversify our return, and soon found ourselves in a mid region of beauty. We passed down woody dells, across little swift-running, shadowy streams, and then suddenly came into a sunny field, like an island amid the wood, where haymakers were busily and merrily at work. "Sunny were they all and warm," seeming all health and cheerfulness; a beautiful picture of what one loves to fancy the English peasantry. The whole field was a perfect bit of Arcadia, with its tall hawthorn hedge, its row of old crab-trees, its background of wood, and, beyond, distant peeps over a sunny landscape. But the field itself was the finest picture; there was a stout jovial dame, an English farmeress, overlooking her men and maidens at their work. Groups of these were well arranged in every variety of attitude and costume; and here and there were the waggons with all their animation—the call to the team—the team itself, and the busy people all about it. And among them all, the only person unemployed, walked this Arcadian woman, overlooking, with a gracious and satisfied mien, the labours of her numerous dependents. It might be seen in a moment that the season had been propitious, that the abundance of the fields was secured, that she was in that gracious state when she could afford to be bountiful, and that who had gone to her then had gone in a good time.

A succession of like scenery brought us at length to the termination of our ramble. By this time the sun had set, the moon had come up, and the dews had fallen heavily. So closed a day of pleasure—a day of cheap pleasure—such as may rise upon any one who has but the heart to enjoy it.

SYMONS'S "ARTS AND ARTIZANS AT HOME AND ABROAD."

SECOND AND CONCLUDING NOTICE.

THE particulars given in last number of wages and prices of provisions on the continent, will have enabled many of our readers to draw conclusions as to the condition of foreign workmen in comparison with the state of our own industrious classes. Such conclusions, however, cannot be so correct as those drawn by Mr Symons, which we now proceed to give in his own words.

"As the amount of commodities purchasable with the same sum of money on the continent is much greater than the amount purchasable with it in England, various calculations have been made of the proportionate difference; but as this amount of commodities differs not only between countries, but between towns and districts in the same countries, I regard as of very little use any statement of one general measure of a difference, which I have found to vary with the price of food, the fluctuations of markets, the inequality of seasons, and the political circumstances of the countries, from a difference of 5 per cent. to a difference of 100 per cent. It is necessary to specify the place in each country, and the time at which the comparison is to be made, in order to arrive at any thing like a correct ratio of the proportionate value of the same sum at those places. As a general proportion (subject, however, to large variations), we may perhaps assume that in Switzerland 1s. will go as far for a working-man as 1s. 3d. here; in France, Belgium, Rhenish Prussia, as far as 1s. 4d. here; in Austria and many parts of Prussia, as far as 1s. 5d. here; and in Wurtemberg, parts of Austria, some of the Duchies, and Bohemia, as far as 1s. 8d. or 1s. 10d. here; always comparing towns with towns, and country with country; agricultural with agricultural districts, and manufacturing with manufacturing districts. Hereafter, of course, in using the term wages, I mean *real* wages, that is, *amount of commodities purchasable with the money*.

It will be seen that one of the most salient features of difference between home and continental wages, consists in the fact, that, whilst very great disparity exists between the rates of payment in the different departments of labour at home, an uniformity prevails abroad, varied alone by the variations of skill required, and by the local demand for and supply of labour. It will be further observed, that the branches of industry which are higher paid with us than abroad, such as spinners, tailors, &c., are precisely those which are in combination among us; and that those, such as hand-loom weavers, &c., who are worse paid here than abroad, are those who have no combinations, at least none effective in maintaining the rate of wages. To this fact I shall recur hereafter; for to the absence of combinations abroad, I entirely attribute the uniformity of foreign wages. Taking a general view of the comparative pecuniary condition of the working-classes on the continent and at home, I have no hesitation in saying, even after the difference in value of money is taken fully into account, that the working-classes of England in the aggregate are at least by one-sixth better off than the working-classes of the continent. Of course, this statement is subject to very considerable exceptions, which I shall endeavour to specify; but as a general statement I make it with confidence.

The factory work-people are decidedly the best paid in England, in comparison with the same class abroad. The wages in the Lancashire factories average, as I have stated, 10s. 6d. per week per head. Those in France, Switzerland, Austria, and Belgium, vary from 6 francs to 9 francs, averaging 7 francs 50 cents, equal to 6s. 3d. 1— a sum which will, in the districts in question, be equivalent, in exchangeable or real value, to

8s. 4d.; so that cotton factory work-people of Lancashire have 26 per cent., or a quarter more wages than the same class abroad. The disparity is *less* in all other branches of industry; and the difference, with scarcely an exception, will be found to *decrease* in each branch of industry, in the same proportion in which that branch is unfurnished by combinations at home; the journey-men carpenters, tailors, and shoemakers, differing in a lesser degree, the agricultural wages differing very little, and the hand-loom weavers being somewhat higher abroad.

The price of corn, and therefore of the chief articles of food, in France and Belgium, is, for instance, to the price in England as 3 is to 4, or as nearly so during a course of years as possible. Taking this as a ground-work, I have sketched the following proportion between real wages, in the chief divisions of industry in the two countries:—

Classes of Labourers.	In France and Belgium, average Weekly Wages.	In England, average Weekly Wages.	Difference in favour of England, after adding one-third for greater cost of food.
1st Class of Mechanics.	fr. cent. 15 0	12s. 6d.	20s.
2d do.	10 80	9s.	14s.
3d do.	7 80	6s. 6d.	10s.
Farm Labourers.			
Spinning Factory do.	7 50	6s. 3d.	10s. 6d.
men, women, and children.			2s. 3d.

In Switzerland, the paradise of the labouring classes, where the father of almost every family is a proprietor of land, the condition of the working-classes cannot be tested by wages, and their high physical as well as moral eminence places them far above the standard of comparison with any other people of Europe. In France, wages, I consider, are, generally speaking, as low if not lower than in most countries; and the people live in a state of discomfort, which I have not seen surpassed, except in portions of the most impoverished parts of Austria and Wurtemberg.

The comfort of the cottages in England is not equalled abroad, Switzerland excepted. In Belgium there is more cleanliness than in France; the pigs and poultry have not the same prescriptive right to inhabit the bedrooms, which they possess by immemorial usage in most other countries. In Austria the physical comfort of the working-classes is a little superior to that of the French. I have compared these countries with England, in distinction from Scotland, where I found every thing, as regards the country especially, so closely resembling the scenes, practices, and manners of the continent, especially Germany, that I regard it in these respects on a par with Prussia.

In immediate connection with this instructive passage, we may quote what Mr Symons says as to the degrees of contentment manifested by the working-classes of various countries with their condition. "It requires," says he, "but a glance at the turbid discontent of one large portion of our industrial populace, and at the sullen misery of another, to perceive that there is a gangrene of perilous character corroding the vitals of the people. Extend your glance abroad, and the contrast strikes you still more appallingly. The artisans of the continent are, as a body, serene and contented. With less of the means of subsistence, they are neither restless nor wretched. Instances there are of exceeding poverty; but they are more cheerful, and less prone to excitement; the Austrians eminently so. The French, although excitable, are, for the most part, contented. The Belgians are morose, but plodding, and absorbed by their desire for money. The Swiss are by far the most enlightened, the happiest, and the most contented."

How, it may be asked, is this? Primarily, our author attributes it in a great measure to the superior education of the people of Switzerland. In the latter portion of his book, he devotes much space to the illustration of the happy condition of this country—the country which, according to him, "presents the only perfect specimen of prosperity of any nation in the world—one which we cannot too deeply study." "I attach," says he, "great weight to the frugal habits and to the moral restraint of the Swiss people as causes of their signal welfare. I attribute their diligence and skill to their virtue and to their intelligence. I attribute the benefit of their almost stationary population to the force of reason and foresight which induce it; and of none of these several elements of popular welfare do I deny the power. But when I look to the small quantity of grain Switzerland produces—one-third only of the proportion of grain to population in Great Britain; when I see her untoward position for the carriage of her imports and exports, I am compelled to look farther for the sources of eminent prosperity, where all physical circumstances seem calculated to produce peculiar poverty. Her soil even refuses to furnish, with trivial exceptions, the material of any one of the productions in which she chiefly excels; and yet, hemmed in as she is by a cordon of custom-houses, these productions find their way into the remotest markets of the world.

I assign two causes for this state of things. *First*, nearly all the consumers in Switzerland are producers; they have no funded debt, that is to say, there are no body of persons whom those who labour have to keep, and the amount consumed by whom, being non-producers, is as a dead burden on the industry of the rest. *Secondly*, and this is the most effective cause, I attribute the prosperity of Switzerland to her entire freedom of trade. She exchanges what she can best

produce and spare with whatever country has the most of what she wants. Not a single country in return admits her goods free of duty; not one, among the commercial people of the globe, reciprocates her absence of customs. But what is that to her? Does it prevent her buying from whom she will the commodities she desires, and enjoying those commodities when she has them at the cost price, instead of augmenting them to her domestic consumers by a duty? And if foreign countries, who must be repaid in Swiss goods, choose to refuse to give themselves and their consumers a similar benefit, or if they choose, by heavy duties, to put difficulties in the way of their own merchants being paid, what, I repeat, is that to Switzerland?

As for protecting duties, the Swiss people believe that if a trade cannot support itself without a protecting duty, that is sufficient proof that the trade is not suited to the capacities of the country—the proof being that the articles in question can be produced for less money elsewhere. This is taken as sufficient evidence that it is injurious to the country to continue, or to protect, any such trade; first, because consumers in Switzerland must lose the difference between the low price of the foreign article and the higher price of the home article; and, secondly, because the trade in articles which Switzerland can produce, is injured to a greater extent than the other is benefited, by preventing the far greater sale of its produce to the foreigners who produce the goods excluded. The produce which is capable of being sold in other countries is the most profitable to the producing country; and so far from protecting others which cannot be exported, it is the interest of a community to discontinue it. The fact that a trade wants protection, is an amply sufficient reason why it should not be protected.

The Swiss system of commerce and industry may be thus summed up, in its effects, on the production, and on the division, of wealth:—

1. Free trade and industrious habits augment the amount of commodities on the one hand, whilst we have prudence limiting the population, and diminishing consumption, on the other.

2. Just laws, no debt, no sinecures, no entails; the absence of these reduce the number of the non-productive classes, and consequently leave larger shares for those who do produce.

These are the roots of Swiss prosperity.

I have only to add, that, as there is less pressure for food, there are no artificial means resorted to by workmen to secure it. It is this which causes, in England, combinations among those who can combine to raise their wages, to the impoverishment of those who cannot. There are no combinations on the continent: and consequently there is more equality among the shares of labourers."

The volume contains many other interesting speculations, as, for instance, on the condition of the working-classes in our own manufacturing towns; on the elements which govern wealth and wages; on combinations; on the progress of the manufacturing arts abroad as regards machinery; on free trade; and so forth. But none of these topics have we room or inclination to enter upon in the present place. We heartily recommend the book to general attention: the labouring-classes every where ought to club to purchase it.

MACLEAN AND CAMERON, OR THE TWO MERCHANTS.

It chanced, a number of years ago, that two young men, bearing respectively the names of Maclean and Cameron, commenced business at one and the same time, though without connection with one another, as grocers in the large county town of —, bordering on the Highlands. These youths came from the same rural district in the north; but they were of different grades in life, Maclean being the son of a small landed proprietor, and the other sprung from a small farmer on the said proprietor's estate. They had both been sent to the county town some years before; the first to undergo a course of school education which might fit him to conduct a great commercial establishment, the second to be an apprentice in the shop of a merchant, with whom he was distantly connected. The young men, though they had passed the years of their childhood in intimacy, had latterly little intercourse: the son of the laird was ashamed to acknowledge before his companions any connection with the humble apprentice, whose coarse blue coat and cherried bonnet rendered him the jest of the lowland schoolboys; and the distant smile of recognition in a short time gave way to the vacant stare of indifference.

In a few years, the commercial education of the one, and the apprenticeship of the other, had expired; and about the same time, the two candidates for the favour of the town opened their shops. Maclean commenced business in a flashy shop, with a new fashion of bow-windows, which set half the town a-repairing of their fronts, and bow-windowing them. Our merchant sold his goods low, and thus attracted a great run at first. He had many good friends in the town, and his father's influence in the country brought half a dozen carts to

the son's door on the market-day, in order to carry supplies to small dealers in the country. But Maclean was too much uplifted by this success, which, after all, owing to the rate at which he sold, was more in appearance than in reality. He began to give claret dinners and late suppers to all the young men about the town. This, with the help of a little card-playing, soon made an impression on his funds, and he fell in at the same time with flash travellers from the south, who took long-dated bills, and sold inferior goods. Maclean fell fairly into the hands of these men, and in a short time his goods got an ill name. Customer vanished after customer, and those who remained were persons who were dilatory in their payments, and who, having run up a large account, were afraid of deserting him. His temper and habits were not improved by these first strokes of adversity; he became peevish and reckless, and buried reflection in jovial meetings and card parties.

His fellow countryman and parishioner Cameron was in the mean time struggling, by means of the closest attention, and the most rigid economy, to secure a limited but independent living. He lodged in the back shop of his little establishment; his door was the first opened in the morning, and the last shut at night. He cooked his own victuals, swept out his shop, and took off and put on his shutters with his own hands. Every thing was orderly and clean; the floor was every day besprinkled with fresh saw-dust; the scales were scoured into brightness; and the very corks of his bottles were driven in with a more than usual precision. But few footsteps for a long time marked the saw-dust of his floor; his ale was so long kept, that it became tartish, and his heart began at last to give way. When out of the shop, he would sit behind the little screen which hid his inner apartment, and watch with a big heart the entrance of some customer. He saw some hurry by with goods in their hands, others enter into the shops opposite; and he questioned with himself if there was anything in his shop which precluded access. He began to think that the circumstance of there being a step at the door might have an effect, and he thought of taking another shop. While thus musing one day, a countryman, after staring for a while at the sign, entered, and delivered a note which contained an order for some goods from a respectable family in the neighbourhood. With great alacrity the little bale was made up, and directed in the best text hand of the overjoyed grocer, when the countryman, after several messages through the town, returned, and said that he was but a new servant, that the note was directed to Mr Maclean, and that the goods of course could not be taken. With a sad heart Cameron undid the parcel to restore the goods to their respective places, and after twisting convulsively the useless cords which he had unlaced, he looked on the direction, and a few big tears pattered on the thick brown paper. He rushed into his little apartment, threw himself on his humble bed, and wept himself into calmness.

Immediately opposite to Cameron's was the shop of a tobaccoist, whose sole object for forty years had been the making of money; and this he had effected to a very great extent, partly by excessive industry, and partly by the extensive sale of a particular mixture of snuff, which the real snuffers pronounced unrivalled. The public knew as little of this man as they did of the Highlander over his door; his mind and purse were equally impenetrable; and beyond the measured civility of thanking the meanest customer, they could not have known that he had the faculty of speech. He appeared a living mummy, in a brown wig, fustian sleeves, and a dingy apron, and with just that intelligence in his leaden eye which might serve to distinguish a good from a bad shilling. But there is no human being entirely destitute of sympathies; and apathetic as seemed this dreary old man, there were some passages in his life which showed that the sluices of social feeling were sometimes raised in his bosom. Nor was he that unobtrusive being that he was commonly believed to be; his customers were at times startled with a remark on men and things that could never have come, they imagined, within the reach of his observation. The young grocer immediately opposite to him, he had frequently noted; and he had internally complimented him on his persevering industry and complete separation from society. He had remarked also his want of success, and had revolved in his mind the resolution of taking his own small stock of groceries from him. On the day of the young grocer's disappointment, he had beheld the scene which we have described; and when he saw the young man rush into his apartment, he made two or three hasty turns behind his counter, and meditated a dart across the street, so long as the generous impression was uppermost. A feeling of delicacy made him pause for a time; at length, calmly resolute with the intention of doing a friendly office, he laid aside his apron, and ventured across the street. The tobaccoist's passage across the street was an event of as much importance to the neighbours, as the first crossing of the Atlantic by Columbus, for he had never been seen out of his shop,

except on a Sunday when going to church. Great was the interest which was felt when he ascended the step of the Highland grocer's, and none participated more intensely in the feeling of curiosity than the meridian club, which met generally about noon in a neighbouring public-house, for the ostensible purpose of reading a London newspaper which they had subscribed for, but, in reality, for discussing several bottles of porter, for which they hid the mare, as it is called, or tossed up for heads and tails. After giving directions to the disconsolate grocer to send over a certain weekly supply of goods, he abruptly told him that if he wanted a little assistance in the way of paying a bill, he might call over the way; and without waiting to contemplate the amazed object of his charity, he was on his way back to his epitome of a shop, into which a grenadier soldier of a Highland regiment was at the time endeavouring to thrust himself without detriment to his hat and feather.

The hopes of the young tradesman were rekindled by this visit, yet he felt there was something so cold and unapproachable in the manners of the tobaccoist, that he could not think of soliciting him for assistance. But the fit was on the old man, and that same evening the two were sitting in the tobaccoist's parlour over a bit of cheese and a bottle of porter, during the discussion of which they had concerted to buy, on a pretty sure speculation, a considerable quantity of oil, which the old man shrewdly suspected was to rise. Next morning, the grocer had, with the indifferent look of a known dealer, purchased a goodly quantity of oil, and, among others, from his old acquaintance Maclean, who was not a little astonished to find that the small dealer, as he deemed Cameron, was ready, for a reduction of price, to pay down ready money. An involuntary feeling of respect for his neglected friend began to steal over him, and it occurred to him on a sudden that it was very odd that they should not have a meeting for auld langsyne. A night was fixed on, agreeable to both parties; but before parting, the merchant had invited the grocer into his back-shop, where he initiated him into the mystery of removing a headache by the infusion of a glass of brandy into a tumbler of ginger-beer. Then, sitting on the top of a tea-box, he inquired with patronising anxiety about his prospects; talked of their being serviceable to each other; and enlarged, with much volubility and confidence of manner, on the necessity of being punctual and sober. "For God's sake, Cameron," says he, "beware of bad company, and"—assuming a fearful gravity of manner, "beware of forenoon drinking. I have not tasted spirits in the forenoon, till to-day, since last new year's day. Now mark me, I warn you." With this, and many warm squeezes of the hand, he hurried the grocer away to make room for a group of young men who had seated themselves in the front-shop, and were casting longing eyes to the sanctum, where the old friends were. Cameron had to run the gauntlet of staring from the satirical fraternity, and he deemed that he had weathered the straits; but, close behind the door, on a column of Gloucester cheeses, sat a more elderly person than the rest, who, on the stranger's passing, slightly let his jaw fall, at the same time pushing, with the top of his cane, a very red and broad nose up to his eyebrows—movements which produced a shout of laughter which rang in the ears of the afflicted grocer, as he left the region of wit and merchandise. A feeling of resentment had nearly turned him round; but let them laugh that win, he thought, and his mind turned to his new speculation. And well had he speculated, for in less than two days a great rise had taken place in oil; and while he reaped substantial profit, he at the same time obtained the reputation of a shrewd business-man. A number of the gentlemen who had parted with their goods so inopportunistly, vented their disappointment in expressions of contempt for the low cunning of the Highland character: Maclean had nothing to say on that score, but he was mortified at the victory of his old dependent, and meditated a return of some kind in the way of acknowledgment.

To this he was the more incited by the jokes of his acquaintances, who, as soon as they heard of the transaction, set themselves systematically to annoy and torment him. The vengeance which he meditated was not long in being put into execution. While he and his sister were sitting alone that afternoon in their parlour, the latter mentioned incidentally how glad she was to hear that old Pinch had taken their former acquaintance Cameron into his favour. The brother did not like the news, but he took the opportunity of observing that he had asked Cameron to supper. The young lady was not displeased to hear this, but she did not like so well what followed—Cameron "and a few friends." The sister of Maclean had been sent by his parents to overlook his house-keeping, and to curb its growing expensiveness, which was but too well known at home. She was an amiable girl, and disliked her brother's riotous companions, though she knew as little of their real worthlessness as she did of the true state of his affairs. But she had no control over him, and was content to spend her lonely days in her window corner, plying her needle busily, and chewing the cud of her sweet and innocent fancies. Her evenings were but too often disturbed by noisy revelling, but all she could do was to sigh, and to keep as much apart from the scene as possible.

Such was the young lady whom Cameron saw at his countryman's supper-table on the night when the meeting alluded to took place. Remembering home and old times, Miss Maclean was kind and attentive to Cameron. So much was this the case, indeed, that the quizzical boon companions of the entertainer who were there assembled, were obviously disposed to sneer at her courtesy to the somewhat awkward youth. Miss Maclean felt this, and was but the more confirmed in her kindly course; and when, in the only dialogue

which called forth serious conversation, Cameron came off with decided advantage, her eye visibly glowed at his triumph. From that glow it was Cameron's fate never to recover; and so much animation did it inspire into him, that his conversation assumed a boldness and freedom not at all agreeable to the patronising entertainer and his friends. But some of the latter dexterously commenced a conversation of a light and skirmishing kind, where Cameron was placed at a sad disadvantage. Pained at this, Miss Maclean came to his relief, and engaged him in a conversation on old times and scenes, which the pair carried on in fond and sympathising undertones, till the captain—the same gentleman who raised the laugh against Cameron in Maclean's shop—annoyed at seeing two human beings apparently so happy, broke in on the dialogue with a request for a song. The young lady complied, and it was expected by the party that she would retire at its close. But on this occasion she chose to depart from her usual rule, in spite of some very expressive looks from her brother, who saw that his friends were growing impatient to get their will wreaked on the butt of the evening. An opportunity of beginning the sport was afforded, by Cameron's request for another song from Miss Maclean, during the performance of which he stood beside her at the piano, turning over the music, and wholly absorbed in listening to what he thought the sweetest sounds that ever came from human lips. His abstraction enabled one of the party to convey into his tumbler a most potent infusion of spirits. When the song closed, the captain called for three successive bumpers, one to the health of Miss Maclean, a second to that of the entertainer, and a third to that of the stranger guest, Mr Cameron. These toasts were accordingly given in rapid succession, and poor Cameron drank off the strong infusion. A replenishment was of course immediately called for. Miss Maclean now saw the propriety of retiring; and the abrupt and eager haste of Cameron to do her honour by opening the door, showed the impression that had been made upon him in more ways than one, and called forth a number of nods and winks, all highly amusing to the company.

It would be painful to describe minutely the progressive steps of Cameron's degradation on this memorable night. The unsuspecting youth, already warned beyond the bounds of prudence, was an easy prey to the experienced jokers then and there assembled. They led him through the stages of noisy contradictiveness and of maudlin tenderness, and finally laid him helpless on the floor. Having brought him to this condition, they touched up his face scientifically with a burnt cork, put a pair of mustard epaulettes on his shoulders, and then carried him through the streets on a deal board which fell in their way, to the door of Pinch the tobaccoist, against which they placed him in a leaning posture. They then aroused Pinch by a thundering knock, and departed, thinking they had thus given their victim a finishing stroke. But they knew not the character of the old man. He knew of the supper; and when poor Cameron fell at his feet on the opening of the door, Pinch at once saw through the whole iniquitous scheme. He called up his servant, and got his young friend put to bed, giving the woman orders to awake him early in the morning. When morning did come, and Cameron was roused to consciousness, his feelings were inconceivably painful. On crossing to his little shop, every bottle and drawer seemed to upbraid him. But his greatest shock was caused by his first glance at his looking-glass, where the yellow shoulder-knots and the dark mustachios were but too visibly reflected. Indignation mingled with his self-reproach, when he thought of being at Pinch's, and of the reason why he was taken there. Cameron almost wished that the darkness of that winter morning could have continued for years. But his mind grew gradually calmer, and he bent himself resolutely to the endurance of the ridicule which he was sure would fall upon him. Nor was he wrong in his anticipations. On taking off his shutters—on which, by the bye, some of last night's friends, expecting him to sleep late, had written "Not dead, but dead-drunk"—Cameron saw knots of people already assembled at the doors of his rivals in trade, and all laughing immoderately. In truth, the whole town soon heard of the affair. But the issue was very different from what had been expected by the practical jokers. All respectable people were indignant at the attempt to injure and ruin a harmless and industrious youth, and many was the customer whom this feeling brought to Cameron's door. On the other hand, Maclean's conduct was universally reprobated, and his trade received a serious blow in consequence. No one was ostensibly more indignant about the business than the captain, who had taken care not to join the procession to Pinch's. He lectured on it next morning for hours to various little groups in the streets; went to Miss Maclean, and brought tears from her eyes by his malicious exaggerations; and finally was on his way to give his tormenting condolence to Cameron himself, when he was prevented, by seeing, at the grocer's door, the carriage of Colonel Macara, a person who had always treated him drily. It was the servant of this gentleman who had committed the mistake about the parcel, and the colonel's punctilious notions of honour led him to call and make an apology for the mistake. He did more than this. After emptying Cameron's "sweetie" bottles for his children, the colonel gave an order for some whisky. The article proved to be particularly good. Orders from the colonel's friends followed, and ere long a good family trade in this article had been established. Cameron's relations in the north took care that he should never want the means of continuing this traffic.

His old schoolfellow, Maclean, was sinking rapidly in the mean time; and to maintain the family honour, his father's small property was bonded deeply. The comforts of those at home were thus sadly impaired. The old laird gave up the game licence, and his dogs were sent to a neighbouring farm. The girls, four or five in number, restricted their usual dress expenses, and decked up old things instead of buying new. The eldest girls began to think of going out as governesses, and sat down to their

pianos to practise their collection of tunes, which, as a gay acquaintance one day observed, not knowing the heart-stab inflicted by the words, were as old as the hills. All the household outlay was diminished as much as possible, and indeed necessity compelled this. The old lady, however, stuck obstinately by one custom, which was that of giving a dram to every living being that came to the house. Perhaps the laird himself, deprived of his usual recreations, felt the change of things most severely. He could only sit moping by the fire, ruminating sadly on the letters which post after post brought him from his son. The very payment of these letters became a heavy tax on the elder sister, who managed the money matters; and, on one occasion, she was compelled to apply to her youngest sister, who was innocently accumulating a small sum for a frock. Seeing tears in her sister's eyes, the good-hearted child ran for her purse, and shook the whole on the floor. The old man chanced to behold the action, and, understanding it but too well, he kissed the child, and sobbed aloud. That letter was an insolent cravie one.

The guilty author of all this domestic misery was still proceeding in his work of desolation. He had professed to Cameron his shame for the proceedings at his house, although he confidently maintained that he was not a participator in them. His contrition might have been thought real, had he not shortly after called on Cameron for an accommodation in the way of money, which the grocer after some hesitation granted. There is little difficulty in believing that the forgiveness of the insult, and the accommodation given, were owing as much to the influence of the sister, as to old friendship; and an occasional admittance to the society of Miss Maclean was a temptation too strong for the love-stricken economist. During the succeeding year, he had, by the powerful assistance of the tobaccoist, and a steady adherence to business, risen into a wholesale merchant of extensive connection; and he had just arrived at the resolution that his addresses to Miss Maclean might now be paid without much presumption, when he received one Monday morning an alarming announcement that Maclean had disappeared. All that his sister knew was, that he had left town on Saturday for the country, and that he was to return on the Sunday evening. The bank took the alarm, the shop was examined, most of his goods had been converted into cash, and messengers were dispatched to the neighbouring sea-ports to secure the fugitive. But no trace of him could be obtained; nor was it till years after, that he was heard of as playing the same reckless game beyond the Atlantic.

In soothing the agitation of the sister on this occasion, Cameron's declaration of love came out; and how it was received, may be guessed from the fact, that next morning he was on his way to the Highlands to visit the family of the laird. In the afternoon, while the eldest daughter was standing at the dining-room window, contemplating, with an eye of vacancy, the waste of snow round the dreary mansion-house, the figure of a man and horse in the avenue came on her eye. This was an event in their wintry home; but when it resolved itself into the distinct shape of a gentleman, the interest became more intense. The daughters clustered their heads together; the old lady surmised that it was the laird of —, that had the impudence at last to come and ask the eldest daughter; and the laird himself at last rose from the fire-side, and looked with curiosity, not unmixed with apprehension, at the approaching guest. While the work of guessing was going on, and while the eldest sister had set down in her mind that hare collops, a fowl, and a dumpling, might be calculated on for dinner, the stranger drew to the door, and dismounted. Cameron was ushered into the drawing-room, and there he was destined to remain until the process of dressing, which was now going on with rapidity in different rooms, should be completed. The old gentleman might have received him; but, calculating on the excluding influence of the storm, he had not shaved for three days, and he was now vexedly strapping his razor, and demanding hot water in no very patient tone, as Jenny was plying from room to room, among the misses and mistresses, with a pin in her mouth and a hair-brush in her hand. A great many orders and reproaches, given in intent whispers to Jenny, by the ladies, made her forget the laird and his hot water; this, at last, however, she found time to think of, but in the hurry of pouring it into the shaving-pan, a certain quantity fell on the house dog, whose howlings and prancings through the kitchen were altogether hideous. "Lord preserve us!" ejaculated the laird; "what's that now?" and the tortured animal rushed into his bed-room, ploughing the carpet with his nose, the whole length of the room. Mean time, the poultry had been attacked by the kitchen servant in the back court, and one of the hens which was particularly aimed at, had, in desperation, taken wing, and come smash against the back window of the drawing-room. The nerves of all were in high excitement—their superstitions became roused—and it was only after an effort at mental composure, as her hand rested on the handle of the drawing-room door, that the elder sister ventured in. Another entered, and rushed back to announce that it was Duncan Cameron's son, who had set up the shop in —. The old lady tossed her head with disdain, and the laird, who had cleared off the crop on his chin, on hearing this, resolved, in the present state of his razors, to leave his upper lip unshaved. The general impression among the young ladies was, that he looked like a gentleman. The old lady said he was merely good-looking, and the laird thought he was well enough. But they all received him with kindness, and pressed him to stay dinner, which he consented to do.

It was believed that he had been at his father's in the neighbourhood, and that he had thought it his duty to call, in gratitude for the attentions which had been shown to him by their son and daughter. Ere evening, a stillness and seriousness had come over the house; and the younger branches of the family sent anxious looks to the drawing-room, where Cameron, with the laird, his wife, and eldest daughter, were in close divan. The disastrous state of

their son's affairs was developed by Cameron with tact and cautiousness, and the prospect of relief from ruin which was offered to the old man by his generous proposals, assuaged the anguish which he felt for his son's behaviour. By Cameron's interference the property was preserved in the family, and the laird once more resumed his rambles with his gun and dog. In the interval between this visit and the marriage which was now agreed on, the old lady had found out that the Camerons, who were comparatively but a recent importation from a distant part of the Highlands, were, though a decayed family, well connected; and she was every day more impressed with the idea, which was suggested by her daughters, that Cameron was uncommonly like their elder brother, the captain then in India, who was decidedly the genteel-looking lad in the country when he left home. Two months had not elapsed, when Cameron paid his second visit to the mansion-house; but his coming on this occasion was not so unexpected. In the chaise, which was driven up with as much dashing celerity as the state of the avenue would admit, sat Cameron and his friend the tobaccoist, who, on this occasion, shone out in a rather smart wig and a snuff-brown coat, in the character of bridesman. The said acquaintances were only visible afterwards, on the occasions of three christenings, which took place within the space of the five succeeding years. About the expiration of that time, their owner disappeared, after bequeathing his wealth to the young couple, who are now in middle life, and settled in affluence in the mansion-house of the old laird.

BIOGRAPHIC SKETCHES.

THE POSTERITY OF CROMWELL.

IN the middle of the seventeenth century, an extraordinary train of events enabled a private English gentleman to rise over the heads of his fellows, as well as of all who were his superiors, and establish himself in the undisputed sovereignty of three kingdoms. There must, of course, have been an uncommon degree of mental power and force in such a man, and accordingly we find, in his portraits, the appearances of a large brain, and of a vigorous though somewhat coarse character. As, till the forty-second year of his age, he remained in a private station, we must of course suppose that, but for the occurrence of a civil war, he would never have risen much above that station, although we should always be disposed to expect in such a man, even in the most obscure condition, some manifestations of an extraordinary intellect and temper—such, indeed, as Cromwell did display while an ordinary citizen of Huntingdon. A case like his shows in a very striking manner how far accidental circumstances are of avail in advancing even the most remarkably endowed men; for, from all that we know of Cromwell, it appears that he did not so much act under an ambitious impulse, as he was drawn on from step to step by opportunities and temptations which arose in his course. His mind, it may be said, was a great one, and fitted by nature for a grand position; he was, by his native powers, calculated to take advantage of the circumstances which came before him: but still he could not have created the circumstances necessary for his advancement; he was not disposed to do so; and he would have been content with the situation of a village Hampden, if he had not had the opportunity presented to him of rising to be the protector of a republic.

This man, who, though of gentlemanly birth, had been a brewer, resided for six years in the palace of Whitehall, as the inaugurated sovereign of England, Ireland, and Scotland. He received embassages; he carried on foreign wars, and caused the name of England to be more respected than it had been under the greatest of its kings. He had his family established in palaces. He appointed his second and most talented son to be deputy of Ireland. The exiled monarch whose throne he usurped, so far acknowledged his power and dignity, as to sue for the hand of one of his daughters, with a view to regaining by that means a crown which he could obtain by no other. There can be no doubt that, if he had been pleased to accede to the proposals made to him from this quarter, he might have obtained, in exchange for a precarious sovereignty, permanent honours and emoluments of the most splendid kind, which he might have transmitted to his posterity. But he refused all these offers, and died in the possession of his throne, and was buried amongst the kings of England.

When we see what a man of powerful mind can do in certain circumstances for the elevation of himself and his family, it becomes an interesting study to observe how, when he is removed, and the favouring circumstances no longer exist, that family stands with the world. Here, of course, the splendour of the father's name, and the unspent force of his authority, give a little advantage; yet it is impossible for such a family long to hold its place. With all the certainty of the most familiar natural laws, we see it gravitate from the accidental place to that which it is fitted by nature to hold under the new circumstances. Besides a widow, who is said to have been an ordinary woman, Cromwell left five children, two sons and three daughters. One of these daughters possessed a large share of her father's genius, and the second son had some

vigour of character; all the rest were of the commonest mould. Richard, in particular, who succeeded his father as Protector, was simply a mild and inoffensive country gentleman, so far, according to Sir Henry Vane, from being able to rule three kingdoms, that he could scarcely enforce obedience from his own domestic servants. In his portrait he bears a strong resemblance to his mother, and we may presume that he took his intellectual nature also from her. If he had chanced to be more the child of his father, the history of England might, from that accident, have taken a different complexion.

Addresses, by which the people of England have been accustomed ever since to exemplify hypocrisy on a large scale, took their rise, most appropriately, on this occasion. They poured in from all quarters on this sovereign of a single winter, whom they flattered in the most extravagant style. He called a parliament, and then a council of the military officers, which last soon became practically the engine of government. Before May, Richard was left in his palace, to appearance a sovereign, but in reality a mere tenant of that large mansion. The very dishes going to his table are said to have been sometimes intercepted by the republican soldiers who mounted guard. Yet some things are told of him, which would show that he was not altogether destitute of spirit. When the zealots by whom he was surrounded and ultimately betrayed, murmured against his promoting some who had been cavaliers, he said, "Would you have me prefer none but the godly! Here is Dick Ingoldsby," he continued, "who can neither pray nor preach; yet will I trust him before ye all." When the army deserted him, and the last regiment of horse was filing off before him, he opened his breast, and desired them to put an end to his life and misfortunes at once. Though he might well have trembled to oppose the will of such men as Fleetwood and Desborough, he would not leave his palace till they had come to an agreement with him for the settlement of the heavy debts he had incurred in the public service, and particularly for his father's funeral. So resolute was he on this point, that on one occasion Desborough threatened to go and pull him out of Whitehall. Finally, when he was leaving the palace, he desired his servants to be very careful of two old trunks which stood in his wardrobe: a friend, who stood by, asked what they contained, that he was so anxious about them. "Why, nothing less," said Richard, "than the lives and fortunes of all the good people of England." The trunks were filled with the addresses before mentioned, in which the people had devoted their lives and fortunes to the support of his authority. Richard withdrew to the country, and his brother Henry soon after retired in an equally quiet manner from his Irish government. The cessation of the Cromwell dynasty did not occasion the shedding of one drop of blood.

During the year which elapsed before the Restoration, these men had almost become forgotten, so that no inquiry was made for them on that occasion. Henry formally made his peace with the new government through Lord Clarendon. In the summer of 1660, finding some inconvenience to arise from his debts, which after all had not been fully liquidated by the parliament, Richard deemed it necessary to pass over to the continent. Landing at Bourdeaux, he proceeded through the south of France to Pezanas, where it chanced that the prince of Conti was then living as governor of a province. According to Lord Clarendon, Richard made some stay here, "and walking abroad to entertain himself with the view of the situation, and of many things worth seeing there, he met with a person who well knew him, and was well known by him, the other having been always of his father's and of his party, so that they were glad enough to find themselves together." This gentleman told him "that all strangers who came to that town used to wait upon the prince of Conti, who expected it, and always treated strangers, and particularly the English, with much civility; that it need not be known; that he himself would go first to the prince and inform him that another English gentleman was passing through the town, and would be glad to have the honour to kiss his hand. The prince received him with great civility and grace, according to his natural custom, and after a few words began a discourse on the affairs of England, and asked many questions concerning the king, and whether all men were quiet, and submitted obediently to him, which the other [Cromwell] answered briefly, according to the truth. 'Well,' said the prince, 'Oliver, though he was a traitor and a villain, was a brave fellow, had great parts, great courage, and was worthy to command; but that Richard, that coxcomb, coquin, poltroon, was surely the basest fellow alive. What is become of that fool? How is it possible that he should be such a sot?' He [Richard] answered, that he was betrayed by those whom he most trusted, and who had been most obliged by his father. So, being weary of this visit, he quickly took his leave, and the next morning left the town, out of fear that the prince might know that he was the very fool and coxcomb he had mentioned so kindly." The ex-protector proceeded first to Geneva, and afterwards to Paris, where he lived obscurely for many years.

The daughters of Cromwell, being all married to persons in moderate circumstances, were not greatly affected by the Restoration. Henry settled at Spinney Abbey, near Soham, in Cambridgeshire, where he had an estate of about five or six hundred a-year. In the year 1671, the king, in returning from Newmarket,

expressed a wish to call at some house and take refreshment; one of his courtiers informed him that there was a very honest gentleman in the neighbourhood, who would think it an honour to entertain his majesty. The king consented to call on this person, and the cavalcade moved along till it came to the farm-yard of Spinney Abbey, where a man like a farmer was engaged in affairs of husbandry. This man, wondering to see so large a company, came forward to meet them, and one of the courtiers, seizing a muck-fork, shouldered it, and walked with affected solemnity before him. The king, readily perceiving that some joke was intended, asked what it meant. "Why, sire," said the gentleman with the muck-fork, "this gentleman before whom I carry this implement of husbandry, is Mr Henry Cromwell, to whom I had the honour of being mace-bearer when he was in Ireland." Charles laughed; Mr Cromwell was confounded; but the ease of the royal visitor banished all disquietude; the hungry company were treated to the best fare which Mrs Cromwell had; and they departed with good humour and pleasure on all sides.* Henry Cromwell died, universally respected, in March 1674, and was buried in Wicken Church.

Richard lived in Paris till 1680, occupying a poor lodging, and attended by only one servant. That he might attract no attention, he passed under the name of Clark. His debts being at length paid, or ceasing to trouble him, he returned to England, and took up his residence at Cheshunt, a few miles from London, where he lived for many years in the most unostentatious manner. Dr Isaac Watts, who was acquainted with him, says he never, during all their intercourse, heard him allude to his former greatness but once, and that in the most distant manner. His ordinary manner was somewhat grave, but he often indulged in innocent pleasantry. He had an only son, named Oliver, who possessed the manor of Merton, in right of his mother. In the reign of King William III., this Oliver, according to a popular story related by Mr Luson in Hughes's Letters, had occasion to present a petition in his own name alone to parliament. He gave it to a friend, who was a member, to be presented. "Just as this gentleman was entering the house with the petition in his hand, Sir Edward Seymour, the famous old Tory member, was also going in; on sight of Sir Edward so near him, the gentleman found his fancy briskly solicited by certain ideas of fun to make the surly sour old Seymour carry up a petition for Oliver Cromwell. 'Sir Edward,' said he, stopping on the instant, 'will you do me a favour? I this moment recollect that I must attend a trial in Westminster Hall, which may keep me too late to give in this petition, as I promised to do, this morning; 'tis a mere matter of form; will you be so good as carry it up for me?' 'Give it me,' said Sir Edward. The petition went directly into his pocket, and he into the house. When a proper vacancy happened to produce it, Seymour put himself upon his feet, and his spectacles on his nose, and began to read, 'The humble petition of—of—of—the devil!' said Seymour, 'of Oliver Cromwell!' The roar of laughter in the house, at seeing him so fairly taken in, was too great for Sir Edward to stand it; so he flung down his petition, and ran out directly."

On the death of Oliver unmarried in 1705, his estate was disputed at law between his father Richard, and his three sisters, who conceived themselves to have a preferable right to a property once their mother's. This was an indecent occurrence, which probably would not have taken place but for the long separation of the ladies from their father. The ex-Protector, now an aged man, was obliged, on this occasion, to appear personally in court. The judge, on learning who he was, ordered a chair to be placed for the venerable old man within the bar, and requested that, on account of his advanced age, he would sit covered. On the case being heard, the Lord Chancellor commented, in strong terms, on the unfeeling conduct of the daughters, and made an order in favour of the father, observing that they might have permitted an aged parent to enjoy his rights in peace, for the small remainder of his life. As the ex-Protector retired, he chanced to walk into the House of Lords, where some one, to whom he was a stranger, asked if he had ever been there before: he answered, "Not since I sat on that throne." Richard lived for some years longer in the enjoyment of good health. When advanced beyond eighty years of age, he would sometimes mount his horse, and ride several miles. The remarkable circumstance of a dethroned sovereign thus living so long in peace and privacy, surviving so many of his successors, and seeing such strange changes in the political state of a realm which had once been his, has not escaped notice in modern fiction.† In his last illness, and just before his departure, he said to his daughters, "Live in love—I am going to the God of love." He died, July 13, 1712, in his eighty-sixth year. One of his sisters, the youngest, lived till 1720, and his daughters, Anne and Elizabeth, died respectively in 1727 and 1731. The obituary notice of the latter in the Gentleman's Magazine, is in terms touching from

* At this time, and for at least ten years more, the head of Oliver Cromwell was exposed on Westminster Hall. It would have been a pleasant conclusion to this story, if, after experiencing the modest hospitality of the son, Charles had had the magnanimity to order that dismal object to be removed.

† It gives occasion to a striking scene in Sir E. L. Bulwer's novel of "Deveraux."

their simple dignity: "April 8, Mrs Elizabeth Cromwell, aged 82, daughter of the late Richard Cromwell, once Lord Protector of these Realms." These two ladies are described by one who knew them, as "well-bred, well-dressed, stately women, exactly punctilious, but carrying about with them a consciousness of high rank, with a secret dread that those with whom they conversed should not observe and acknowledge it." It is stated that some one, at a watering-place, wishing to insult them, said, "Ladies, your grandfather was hanged;" when Anne instantly rejoined, "but not till he was dead."

The posterity of Richard the Protector closed with the first generation. Of a large family born to Henry, one son and one daughter left descendants. This son, who bore his father's name, became a major of foot, and died in Spain, while with the army, in 1711, leaving a large family, two of whom were lawyers; one an ensign in the army; another in the Excise Office; and a fifth, named Thomas, a grocer in Snow Hill. It would appear that the only male descendants of the hero of Naseby trace their pedigree through the person last mentioned; but the descendants through females are very numerous.

The most remarkable of all the posterity of Cromwell seems to have been a Mrs Bendysh, who was his grand-daughter through his daughter Bridget, by her first husband, General Ireton. Mrs Bendysh bore a striking resemblance to the Protector in person, and was also like him in many features of her mind. When she was only six years of age, he used to allow her to sit between his knees at the cabinet councils, while the most important affairs were discussed. Some one objecting to her being there, he said, "There is no secret I would trust with any of you, that I would not trust with that infant." To prove that he was right in the confidence he reposed in her, he told her something under a charge of secrecy, and then caused her mother and grandmother to try to extort it from her. Promises, caresses, and bribes were first tried; then threatenings, and even severe whippings; but all in vain. As a non-conformist during the reigns of Charles II. and James II., she used to befriend the proscribed clergy, in whose behalf she had often very severe struggles with the magistracy, and generally was victorious. She was privy to the Rye-House Plot, and the projects which led to the Revolution; and previous to the latter event, when cheapening goods in shops, would drop parcels of papers calculated to prepare the public mind for what was about to take place. In latter life, when a widow, she resided at South-Town, near Yarmouth, where she carried on business in salt works and the rearing of cattle, for which her masculine mind and frame of body eminently fitted her. She had all her grandfather's activity of spirit, and the same enthusiastic and visionary kind of piety. Against all disappointments and vexations she had one never-failing resource; she rejoiced at every thing as it arrived; if she succeeded, she was thankful; if she suffered adversity, she was still more thankful. Passionately fond of the memory of her grandfather, from whom she said she had learned every thing, she admired him in nothing so much as his saintliness, always speaking of him as "a chosen vessel," "a regenerated child of God, divinely inspired," and so forth. This was inconvenient, for a hundred would join her in calling her father a great soldier, for one who would allow him to have been a sincere saint. Travelling once in a stage-coach, and speaking of him in her usual phraseology, she called forth some remarks of a particularly ungracious nature from a gentleman who sat in the same vehicle. These she rebutted, and a very violent altercation took place, which lasted till the conclusion of the stage. Mrs Bendysh then took her opponent aside, and told him with great composure that he had belied the most pious man that ever lived; that Cromwell's blood, which flowed in her veins, would not allow her to pass over the indignities he had cast upon his memory in her presence; that though she could not handle a sword, she could fire a pistol as well as he; and she demanded immediate satisfaction for the injured honour of the family. The gentleman, now for the first time informed of the relationship, asked her pardon, and said so much in praise of the brighter side of her grandfather's character, that the journey was continued in peace.

"She would frequently," says a gentleman who had seen her when he was a boy, "come to visit at my father's [in Yarmouth] at nine or ten at night, and sometimes later, if the doors were not shut up. On such visits she generally staid till about one in the morning. Such late visits, in these sober times, were considered by her friends as highly inconvenient; yet nobody complained of them to her. The respect she universally commanded, gave her a licence in this, and many other irregularities. She would, on her visits, drink wine in great plenty, and the wine used to put her tongue into very brisk motion. When she kept clear of her enthusiastic freaks, she was highly entertaining. She had strong sense, a free and spirited elocution, and much knowledge of the world. There was an old mare that had been her faithful companion for many years. The old mare and her manœuvres were as well known at Yarmouth, as the old lady. On this mare she was generally mounted; but, towards the end of her life, the mare was prevailed on to draw a chaise, in which Mrs Bendysh often seated herself. She would never suffer a servant to attend her in these night visits; 'God,' she said, 'was her guard, and

she would have no other.' When the mare began to move, Mrs Bendysh began to sing a psalm or one of Watts's hymns, in a very loud, but not very harmonious key; and thus the two old souls, the mare and her mistress, one gently trotting, and the other loudly jingling, jogged on, the length of a short mile from Yarmouth, which brought them home.*

ASCENT OF THE VIGNEMALE.

THE Vignemale is the highest mountain in the French Pyrenees, and till a recent period was never ascended. There are not, for twenty miles round, summits more rugged, or rocks more precipitous. The glaciers which block up the approaches to it are furrowed by enormous ravines, and the annals of the Pyrenees record more than one fatal event which these recesses have witnessed. In the summer of 1837, the Prince of Moscow and his brother, sons of the celebrated Marshal Ney, at length performed the feat of ascending to the top of the Vignemale, of which adventure the Prince has given a narrative to the world through the medium of the *Revue des Deux Mondes*. From this publication we learn that the Prince was induced to make the attempt by a guide named Cantouz, who informed him that, having been once commissioned by a traveller to find a pass to the top of the mountain, he had sought for two years, and had at last by accident discovered a hitherto unknown approach, which, though of a difficult nature, might be thought to be overcome. "On the 10th of August, at eleven o'clock," says the Prince,† "we were on our way; the weather was magnificent, as is indispensable to such an enterprise; with Vincent, a guide and hunter of Luz, David my servant, and a man to drive a pack-horse laden with clothing and provisions. * After having got a hatchet and crampons at Gavarnie, where we breakfasted, we started westward, in the direction of the valley of Ossone.

We soon came to a steep and stony hill, then to a pretty wood of healthy nut-trees. Half a league farther on, the road became level, to the great comfort of our horses, who, by their frequent halts, had entered protest against acclivities of seventy degrees, up which we had been forcing them. Here there is no high-road: the Vignemale was our pole; the Gave, which issues from it, our compass. As we advanced, we kept *tacking* from right to left, to avoid the steepness of a slippery surface.

To the right, above the Gave, rises the mountain of the Combe, like an immense wall. After a two hours' march, under a sufficiently hot sun, we halted on a pretty green spot, by a spring: we had turned the Malferrat, which till then we had been skirting, and the Vignemale glistened at last before us, displaying all the splendour of its glaciers, all the capricious forms of its peaks.

'There he is,' cried Cantouz, uncovering his head respectfully before his conquest; 'look at that point, which scarcely rears itself above the snow: it is the summit of the mountain. Yonder is the peak where we shall be to-morrow, please God and our Lady of Héas!' It was a case, had we been English, to call for the universal *Hip! hip! hurrah!* with three times three, and to bring down an avalanche; but we have nothing analogous in French. The poverty of our language condemns us to a more expressive silence.

Up to this point our road had been made cheerful by immense flocks, scattered here and there on the ample sides of the Malferrat. But after we resumed our march, we arrived at solitudes no longer animated by the grave sound of the sheep-bell, or the still deeper voice of their faithful guardians. These enormous dogs announced our passage by their intelligent barking, but there was no ill-will manifested. By degrees, the sounds of the valley lost themselves in the air. As there still remained for us a severe day's walk on the morrow, we resolved to pass the night as near as possible to the Plan d'Aube, which is the pass leading to the valley of Serbigliana; and as it was necessary at such an elevation to have a fire all night, we could not advance far above the rhododendron, the last shrub to be found in the ascent of these mountains. We therefore descended again to a little valley at the foot of the Cardal, where some Spanish flocks were grazing, under the care of two shepherds. It is impossible to imagine any thing more picturesque. These two stout, well-made fellows, wore the dress of the Arragonese peasants, their brown faces were overshadowed by the large *sombrero*, and with every word they uttered they showed ranges of teeth as white as their own goats' milk. They were both knitting stockings for their own private wearing. We soon struck up a conversation: we asked the usual questions; they made a tender of their best services, and I employed them with others of our party to fetch wood. We soon found a place of encampment, on the edge of a pretty *gave*, by which we halted. The horses were unsaddled and turned adrift, and the pack-saddle was rummaged for coverings and provisions.

We passed the night merrily; every possible combination of rum, brandy, wine, and sugar, was exhausted by the eminently inventive genius of my brother, to keep our guides warm and in good humour; and they never ceased to sing '*Là-haut sous les montagnes*' in the most sonorous of voices, to do honour to

masters so considerate. Thus our dinner passed off successfully, with a shade too much, perhaps, of wastefulness, for which our next night's supper was to suffer.

In a brotherly spirit, we invited the Spaniards to take their places at our banquet; they came, knitting in hand. These good fellows were not wholly ignorant of the arts, for having, each of them, drained an enormous glass of punch, they sang, at our request, a song in the time of a fandango, ending in loud cries similar to those uttered by the Arabs of Mount Atlas. To their cries, Perro, their large dog, answered, by giving tongue *au grave*. At last their songs ceased, the shepherds went to lie down with some of our party on the dry stones in their den, offering us a place there. But the recollections of a night passed in the best inn at Poitiers induced my brother and myself to decline this hospitable shelter: and those of our guides, who, like ourselves, did not wish to run the risk of the Spanish *Coula*, stretched themselves round the fire, which was kept up all night. How sublime were the heavens on that night! Ye who have never bivouacked on the Cardal, know not what a fine night is!

Next morning we ascended the Cardal, and towards seven were within sight of the Plan d'Aube, but we did not traverse it immediately, for we lost three-quarters of an hour in a fruitless attempt to surprise an izard, which was feeding above the pass. After having traversed the Plan d'Aube, and descended into Spain through the valley of Serbigliana, we advanced for another half league towards the right, and stopped at the foot of Malferrat. Here we left our horses, and began the ascent on foot.

We now moved upward in a northern direction, and above the valley of Serbigliana. At first the road is almost level, skirting the base of the mountain for an hour or two, and I kept at the head of the column to regulate the pace. We soon came to a steep ascent, with loose slates and stones. This was most fatiguing; these avalanches of stones, or *lavanges* as they are called, must be rapidly passed—you must not stop—you should, indeed, scarcely plant your foot, for the least displacement of the stones causes an incalculable disturbance—all the mountain seems in motion. It would be imprudent for any one to attempt to resist the current; he would be swept away. It was with pleasure that we quitted this moving earth for the solid rock; for the latter, with a good head and a little address, you can manage well enough. This part of the mountain, which is not very steep, was easily traversed. One point now brought us to a halt. Imagine a natural chimney, a score of feet in height, and so narrow that the body could scarcely enter it. Where were we to place the points of our iron-shod sticks? where set our feet? The danger was not great, but the obstacle seemed all but insurmountable. It is difficult to say how we got through it; yet, in truth, it detained us but a short time. The Vignemale was waiting for us. This reminds me of an answer given to the Count de Stednick, by a French grenadier during the war of independence in America, where the marshal served as a volunteer. A French company had scaled a fort, situated on so precipitous a rock that when M. de Stednick, then a junior officer, came there, he could not but express his surprise; and he asked of a grenadier, 'How, my friend, did you contrive to get up?' 'Ah, captain,' replied the soldier, 'it was because the enemy was here!'

Towards eleven o'clock we made our first halt. Already more than one chain of mountains extended itself at our feet; behind us, the Vignemale raised its peak among sharp-pointed rocks; to the right, an enormous amphitheatre displayed its marble circle, like that of the Oval of Gavarnie and that of Troumouse. We took some provisions from our guides' bag, and breakfasted. Cantouz proudly carried my barometer; he appeared to attach much importance to the mountain's height being ascertained with certainty. When we arrived within sight of the snows, we saw a herd of izards gently traversing these slippery declivities, and pointing out our road. We no longer worked our way upwards by means of the walls of rock. The scene here spread out, and we advanced in a long line, choosing at pleasure the place for our steps. Many of the huge stones, blanched and polished by the waters, appeared ready for the sculptor's studio. Directing our steps towards the left of the arch formed by the walls of the amphitheatre, we were presently at the foot of the great glacier. There a new halt took place; it was requisite to fix our crampons firmly, to tighten and close our *espartilles*, to mix rum with ice water, and fill a bottle with it, for our luncheon on the summit—for the heat was extreme, and henceforward we could find no water; then commenced the most fatiguing and monotonous march imaginable, upon snow whose whiteness dazzled us. In proportion as we advanced, it grew more precipitous and more firm;—each guide in his turn taking the lead, and cutting steps in the snow. We advanced in file, one behind another, and scarcely at every new tack gaining ten yards. We had now been on the snow more than two hours and a quarter; and it was necessary to leap a very deep ravine, for the glacier does not join the rock closely, because of the heat, which melts the snow; but this was easily effected. I remarked here, with surprise, some flies upon the snow. I know that Ramond has described them as found on Mount Perdu; they were very lively.

Already our respiration had become difficult, the quickness of the pulse increased, and, in spite of our feelings of strength and elasticity, we were obliged

often to pause for breath. The rock which we had to climb is of primitive limestone. I saw nothing resembling granite; yet the Vignemale is, almost to a certainty, of the primitive formation, like the Marboré and the Mount Perdu, than which it is only some yards lower. When fatigue begins, all efforts to advance become mechanical, and great distances are accomplished almost without taking notice. The similitude of every object, joined to that troublesome gasping for breath, made our rough road monotonous and wearisome, and we now crept forward on hands and feet. It was necessary, however, to awaken up at the sight of the precipice, which towers over the pass of Panticou. Never, I confess, did I dream of any thing so frightful; I did not attempt to measure its height, for it was with repugnance that I looked upon it. In advancing towards the summit of the first peak of the Vignemale, the rock was ridged like the roof of a house, and we had to make our way astride along it. There nature has placed an enormous tunnel, which Cantouz called the chimney of the Vignemale; and a stone falling through this opening is not stopped till it reaches the valley. After some desperate efforts, I reached the top of the rocks, and found myself on an immense circular plain of snow—evidently a colossal basin, round which arose four peaks of unequal size—the four summits of the Vignemale.

We rested for an instant on the edge of this crater, but we had no time to lose, and by an optical effect, which I soon recognised as a deception, the peak still to be climbed seemed of itself a mountain. The fear of not having sufficient time for our barometrical observations, and, above all, of not finding ourselves in a fair way to return before night, made us hasten onward, across the plain of snow. We took the precaution to walk in file, each of us holding a rope, that if one slipped into a ravine he might be sustained by the weight and the strength of his companions. David, my servant, was the only person to whom the precaution was of use—he was already shoulder-deep in the snow when we drew him out. We arrived without accident at the foot of the Vignemale, and, finally, at the summit of the peak, at half past two, an hour after our last halt, as Cantouz had promised us.

The panoramic view I shall not attempt to describe—a geographical chart of the Pyrenees could only imperfectly give an idea of it. Our first care was to make our barometrical observations, then to build up a little tower for the purpose of hoisting a flag, which we planted thereon, and saluted with a discharge of musketry, and drank the health of the Vignemale.

To our extreme surprise, a voice answered us. It was not an echo, but, indeed, a far-off human voice. How was this to be explained? We swept with our glasses all the neighbouring mountains, without finding a trace of a human being, when a little black speck on the surface of the Lake de Gaube attracted our attention. It was a fisherman's boat—and it must, almost to a certainty, have been thence that we were answered. In spite of the distance, this did not appear to astonish our guides, who were delighted to know that the people of Cautelets would that very evening learn the result of our adventure.

Before our departure, we left beneath the flagstaff a bottle, in which was a paper containing the details of our ascent.

From observations, the height of the Vignemale above the level of the sea should be 11,221 feet, supposing, according to Pasumot, Luz to be 390 toises above the sea.

It was now necessary to depart. We soon reached the snow, which we crossed without accident. Yet it was easy to feel that the energy of our will had till then sustained our legs, and that, after success, they were disposed to give way a little. We had to guard against one great danger, that of rolling down the stones upon those who went before. I was one of the first who attacked the glacier. We were all bruised upon the rocks, and we hoped to rest ourselves by sliding down the snow. We had resumed our *crampons*, and promised ourselves some amusement in descending these *montagnes russes*. I took but little care, not imagining they were so steep as to be at all dangerous. Thus, at the first step, I was thrown over, but fortunately kept hold of the girdle of my guide. However, my *crampon* turned, and I again lost my equilibrium, let go my hold, and then I began to descend, sliding on my back. Unluckily I had no stick; I perceived immediately that the rapidity of my progress began every instant to increase in a frightful manner, and, above all, by the shouts on every side of me, that I was in great danger—I was shot off like a rocket down a declivity of sixty-five degrees, which it had cost us two hours to ascend, and at a rate which made it impossible but that I must lose my breath if it continued. I thought with a shudder of the rocks below, but I did not lose my presence of mind, and continued to keep myself on my back. Bernard Guillembert, however, had thrown himself forward at a lower point, to try and stop me. Having buried his stick and his *crampons* in the snow, he awaited me at a little promontory formed by the rocks, which pushed out on the glacier. As well as I could I steered for him, and had the good fortune to reach the spot. The shock was so violent that I overset him; but the diversion effected by this rencontre saved me; for having slidden some little way farther, I was stopped by a projection of the rock, towards which I extended my feet. The blow was violent, as may be imagined; nevertheless, with the exception of a large bruise on the heel, and being slightly stunned, I experienced no ill consequences, and was able to rise almost immediately. Bernard was near

* The above article is composed of the more interesting particulars contained in Noble's Memoirs of the Cromwell Family, 2 vols. 8vo. 1786.

† We use a translation which has appeared in the *Athenaeum*.

me, covered with blood, his arms almost dislocated; for, placing himself before me to stop me, he had not chosen a position sufficiently solid: the blow had struck him like a thunderbolt, and the poor fellow had rolled over the stones head foremost.

My brother then began to descend, leaning one hand on the shoulder of Cantouz, the other on his iron-shod stick, and walking with all the caution which my accident inspired—still, in spite of his precautions, he had not made three steps when he slipped, dragging his guide with him. The efforts of the guides to stop him proved useless; in vain they buried their sticks in the snow. I saw them both launched on the terrible descent. Baptiste threw himself across their path, plunging three-fourths of his stick in the snow; leaning against this prop, and with his feet planted, as it were, in the glacier. The stick broke; but Baptiste, overthrown, had the good luck to stop himself by the handle, which he still held. Judge of my anxiety, when I saw that rapid course accelerating every instant, my brother and his guide descending always together. At last, when about to be dashed against a frightful jutting-out rock, Vincent precipitated himself with intrepidity before them, with a desperate blow, burying his whole hatchet in the snow. He waited, fixing his eyes on them. I held my breath, and, thank God! in spite of the violence of the shock, he had strength enough to resist it, and to stop them on the very verge of the abyss!

This episode cast a serious shade over our success, and the descent, though finished without new accidents, wanted the light-hearted gaiety of our outset. It was dark night when we arrived in the valley of Serbighiani, at the place where we had left our horses, too late to travel farther; and we were obliged to pass the night there, even without fire. Fortunately the weather was beautiful, and we did not suffer much from the cold. We returned to Luz in the course of the following day, and Bernard's accident, I am happy to say, was not followed by any ill consequences."

MR. J. F. SMITH ON JOINT-STOCK BANKING.*

THE object of this pamphlet is to take into consideration those evils attending the present system of Joint-Stock Banking, which are expected in a short time to come under the attention of Parliament, with a view to a legislative remedy. The grand evil is, as stated by Mr Smith, that, "under the existing laws, the compliance with a few inefficient official forms enables any adventurer, possessing funds or credit merely sufficient for the publishing of a prospectus, to organise a Joint-Stock Bank, with a nominal capital of millions—to issue paper money, and give altogether such a colouring to his proceedings as effectually to entrap the unwary, and enrich himself and his confederates at the expense of a credulous public." That the evils contemplated by Mr Smith really exist, and are operative of great injury to many individuals, is, we believe, not questioned. The Joint-Stock system of banking, long conducted in Scotland with prudence and honour, is now rapidly becoming a favourite game of the rash and designing all over the empire. Some late disclosures in Ireland and at Manchester manifest this in a striking manner; and it is probably only for time to develop the full extent of the mischiefs of which the basis has been laid within the last few years.

After some preliminary remarks, Mr Smith addresses himself to the task of suggesting a complete code of regulations for future establishments. He proposes in the first place, either a small board of commissioners, whose duty it should be to see that the provisions of the new law are faithfully complied with, and to whom the various periodical returns might be made, or that the same duty should be entrusted to the Board of Trade or the Secretary of State for the Home Department. In what follows, he assumes that such a board is appointed. He then states those additional regulations which would require to be imposed on existing banks, in order to bring them to a level in point of security with the new ones, for which he proposes the following amongst other arrangements:—

"I. That when a Joint-Stock Association shall hereafter be formed for the purpose of banking, the parties interested in the first instance shall transmit to the Board of Commissioners a full prospectus of their intended establishment, stating the proposed amount of nominal and paid-up capital, the number and value of shares, the names and designations of the parties chosen as directors for the first year, the locality of the head office, and, as far as practicable, the number and situation of branch establishments. This prospectus shall also be accompanied by a list of the proprietary, signed by each shareholder, who shall adjet to his signature a distinct memorandum of his place of residence, profession, or trade, and the number of shares taken by

him. The whole shares must be subscribed for, and the directors having collected from the shareholders one-fourth of the intended paid-up capital, shall invest the same in government securities, East India or Bank of England stock; or, if preferred, shall lodge the same in deposit, with the Bank of England, Bank of Ireland, or one of the chartered Banks of Scotland, and exhibit satisfactory evidence of this to the Board of Commissioners.

The Commissioners being satisfied that these preliminary steps have been taken, shall then adjust with the directors the draught of their proposed deed of partnership, which shall be similarly executed in duplicate, and deposited along with the signed list of shareholders, as before, in the proper stamp-office. These forms having been gone through, the association, on producing some satisfactory evidence of the payment of another fourth part of their real capital, should then have their notes stamped, and receive a licence for their issue. With regard to the remaining portion of their real capital, a peremptory clause might be inserted in the deed of partnership, binding the shareholders to advance the same in two instalments, within six months or a year from the date of their licence, under a penalty of a total forfeiture of banking privileges. When the whole real capital is paid up, some satisfactory evidence of the fact should be given, or a solemn affirmation might be made by all the directors as before, and the company should then be entitled to the privileges of a royal charter.

In compelling payment of so much of the capital at an early stage, a guarantee will be obtained that no rash or immature speculation will be called into existence, but that the establishment of each bank is in some degree called for by the wants of its locality; and this provision, with the proposed regulation as to the minimum amount of a share, afterwards noticed, will ensure beyond doubt a respectable class of proprietary; since at present a vast majority of the first applicants for shares in Joint-Stock Banks are precisely the persons who ought to be excluded, being parties who have generally little to lose, who are often unable to pay even the first instalment, and who join the concern with the intention only of speculating on the premium which may be expected on disposing of the scrip.

II. That no existing or future Joint-Stock Bank shall be permitted to have nominal shares of less value than £100, on each of which £50 sterling must be paid up; and that such shares shall in no event whatever be divisible into fractional parts, so as to admit of any partner having a less interest than £50 sterling. That this shall be the fixed minimum amount, leaving it to the parties themselves to increase the value of shares to any further extent they may deem expedient; but observing in the first instance the same proportion between paid-up and nominal capital.

No good objection it is supposed can be brought forward against such a provision as this; since it is obviously the interest of all parties, that banking business should be in the hands of a responsible class; and surely no one who cannot advance £50 should ever be admitted as partner into a bank. The immediate effect therefore of increasing the amount of shares, in conjunction with the obligation to pay up the whole, or a great part of the money, would be to exclude all such objectionable parties, and to distribute the shares of a Joint-Stock Bank among a class of persons more responsible, and better qualified, by superior intelligence and respectability, to be partners, who can contribute their assistance to the institution in times of pressure, and not leave such a task to a few of the more opulent shareholders.

III. There might be advantageously a limitation of the circulation of Joint-Stock Banks, in proportion to paid-up capital; an issue to an equal extent might perhaps be a safe limit, with an obligation to keep a deposit of one-fourth of the amount of such issue in gold and Bank of England notes. It is worthy of consideration, whether it would not be prudent to carry this restriction still farther, especially if the principle of limited liability be conceded, and to limit the issues to one-half, or at the utmost two-thirds of the advanced capital, with an obligation to keep a deposit of one-fourth of such issue in gold. This would always secure a respectable amount of paid-up capital, and give great additional security to the public. A restriction of this nature would also answer the objections of those who contend that security for the payment of notes should be left in the hands of government. The whole paper circulation of Scotland is estimated at £4,000,000, while the paid-up capital of three of the banks there alone amounts to £4,100,000.

IV. The question of limiting or not limiting the responsibility of a shareholder in a Joint-Stock Bank has given rise to frequent discussion, and both sides of the argument have found advocates of acknowledged ability. Under the existing system, any person becoming a partner in one of these associations is liable for its obligations to the last farthing of his fortune. This has done much harm, for it has been the means of deterring the more respectable and wealthy ranks of the community from joining these associations, and the great mass of banking business has consequently been thrown into the hands of a less responsible and much more speculative class, the very thing which ought to have been specially guarded against.

It is therefore proposed, as a part of the plan here submitted, to make the liability of shareholders in all Joint-Stock Banks extend to double the amount of their paid-up capital; and that all liability whatever shall

cease on the expiry of one year, after their names have been removed from the stamp-office registry."

Mr Smith submits another set of regulations which might be provided for in deeds of partnership, and into which we have not space to enter. We warmly recommend his sensible and judicious pamphlet to public attention.

DROLLERIES OF CAPTAIN GROSE.

SECOND ARTICLE.

Galimaufry. A hodgepodge made up of the remnants and scraps of the larder. [We suspect that the word is applied generally to a confused mixture of things. Its origin, with which Grose appears to have been unacquainted, is thus explained to us by a Parisian friend. In one of the provincial parliaments of France, by which law cases were heard and decided, a barrister was one day pleading in behalf of a person named Mathias, whose cock had suffered some injury from a neighbour. In his pleading, which was in Latin, he frequently came over the words Gallus Mathie, or (in the possessive case) Galli Mathie—the *th* in the latter word being of course pronounced as *t*. His speech thus took the appearance of a confused jargon—the judges declared they could not understand it—and the people from that time called any thing of a very confused nature Gallimaufry, which has been corrupted by us into Galimaufry.]

Jack of Legs. A tall long-legged man; also a giant, said to be buried in Weston church, near Baldock, in Hertfordshire, where there are two stones fourteen feet distant, said to be the head and feet stones of his grave. This giant, says Salmon, as fame goes, lived in a wood here, and was a great robber, but a generous one; for he plundered the rich to feed the poor: he frequently took bread for this purpose from the Baldock bakers, who, catching him at an advantage, put out his eyes, and afterwards hanged him upon a knoll in Baldock field. At his death he made one request, which was, that he might have his bow and arrow put into his hand, and, on shooting it off, where the arrow fell they would bury him, which being granted, the arrow fell in Weston churchyard. About seventy years ago, a very large thigh-bone was taken out of the church chest, where it had lain many years for a show, and was sold by the clerk to Sir John Tradescant, who, it is said, put it among the rarities of Oxford.

Jack Robinson. Before one could say Jack Robinson; a saying to express a very short time, originating from a very volatile gentleman of that appellation, who would call on his neighbours, and be gone before his name could be pronounced.

Kemp's Morris. William Kemp, said to have been the original Dogberry in "Much ado about Nothing," danced a morris from London to Norwich in nine days, of which he printed the account, A.D. 1600, entitled Kemp's Nine Days' Wonder, &c.

Kemp's Shoes. "Would I had Kemp's shoes to throw after you." Ben Jonson. Perhaps Kemp was a man remarkable for his good luck or fortune; throwing an old shoe, or shoes, after any one going on an important business, being by the vulgar deemed lucky.

Ketch. Jack Ketch; a general name for the finishers of the law, or hangmen, ever since the year 1682, when the office was filled by a famous practitioner of that name, of whom his wife said, "that any bungler might put a man to death, but only her husband knew how to make a gentleman die sweetly." This officer is mentioned in Butler's Ghost, page 54, published about the year 1682, in the following lines:—

Till Ketch observing he was chous'd,
And in his profits much abus'd,
In open hall the tribute dum'd,
To do his office, or refund.

Mr Ketch had not long been elevated to his office, for the name of his predecessor Dun occurs in the former part of this poem, page 29:—

For you yourself to act squire Dun,
Such ignominy ne'er saw the sun.

The addition of "squire," with which Mr Dun is here dignified, is a mark that he had beheaded some state criminal for high treason; an operation which, according to custom for time out of mind, has always entitled the operator to that distinction. The predecessor of Dun was Gregory Brandon, from whom the gallows was called the Gregorian tree, by which name it is mentioned in the prologue to *Mercurius Pragmaticus*, a tragi-comedy acted at Paris, 1641:—

This trembles under the black rod, and he
Doth fear his fate from the Gregorian tree.

Gregory Brandon succeeded Derrick [who was finisher of the law about 1608. See the play of the *Bellman of London*, where one of the characters says, "At the gallows where I leave them, as to the haven at which they must all cast anchor, if Derrick's cables do but hold."]

King John's Men. He is one of King John's men, eight score to the hundred; a saying of a little under-sized man.

Kittle Pitchering. A jocular method of hobbling or bothering a troublesome teller of long stories: this is done by contradicting some very immaterial circumstance at the beginning of the narration, the objections to which being settled, others are immediately started to some new particular of like consequence; thus impeding, or rather not suffering him to enter into, the main story. Kittle pitchering is often practised in confederacy, one relieving the other, by which the design is rendered less obvious.

Maccaroni. An Italian paste made of flour and eggs.

* Proposed Alterations in the System of Joint-Stock Banking, with a Defence of the Small-Note Currency of Scotland. In a Letter to the Right Honourable the Chancellor of the Exchequer. By John Fairfull Smith, Writer to the Signet. Edinburgh, Bell and Bradburn; Ridgway and Sons, London. 1830.

Also a fop : which name arose from a club, called the Maccaroni Club, instituted by some of the most dressy travelled gentlemen about town, who led the fashions; whence a man foppishly dressed, was supposed a member of that club, and by contraction styled a Maccaroni.

Martinet. A military term for a strict disciplinarian; from the name of a French general, famous for restoring military discipline to the French army. He first disciplined the French infantry, and regulated their method of encampment: he was killed at the siege of Doebourg in the year 1672.

Pettifogger. A little dirty attorney, ready to undertake any litigious or bad cause: it is derived from the French words *petit vague*, of small credit, or little reputation.

To Pommel. To beat: originally confined to beating with the hilt of a sword; the knob being, from its similarity to a small apple, called *pomme*; in Spanish it is still called the apple of the sword. As the clenched fist likewise somewhat resembles an apple, perhaps that might occasion the term pommelling to be applied to fistyuffs.

Priscian. To break Priscian's head; to write or speak false grammar. Priscian was a famous grammarian, who flourished at Constantinople in the year 525, and who was so devoted to his favourite study that to speak false Latin in his company was as disagreeable to him as to break his head.

Sacheverel. The iron door, or blower, to the mouth of a stove: from a divine of that name, who made himself famous for blowing the coals of dissension in the latter end of the reign of Queen Anne.

Salmon-gundy. Apples, onions, real or chicken, and pickled herrings, minced fine, and eaten with oil and vinegar: some derive the name of this mess from the French words *selon mon goût*, because the proportions of the different ingredients are regulated by the palate of the maker; others say it bears the name of the inventor, who was a rich Dutch merchant: but the general and most probable opinion is, that it was invented by the Countess of Salmagundi, one of the ladies of Mary de Medicis, wife of King Henry IV. of France, and by her brought into France.

Squelch. A fall. Formerly a bailiff caught in a barrack-yard in Ireland was liable by custom to have three tosses in a blanket, and a squelch; the squelch was given by letting go the corners of the blanket, and suffering him to fall to the ground.

Steenkirk. A muslin neckcloth carelessly put on, from the manner in which the French officers wore their cravats when they returned from the battle of Steenkirk.

Swelled Head. A disorder to which horses are extremely liable, particularly those of the subalterns of the army. This disorder is generally occasioned by remaining too long in one livery-stable or inn, and often arises to that height that it prevents their coming out of the stable door. The most certain cure is the *unguentum aureum* [golden ointment]—not applied to the horse, but to the palm of the master of the inn or stable. N. B. Neither this disorder, nor its remedy, is mentioned by either Bracken, Bartlett, or any of the modern writers on farriery.

Tartar. To catch a Tartar; to attack one of superior strength or abilities. This saying originated from a story of an Irish soldier in the imperial service, who, in a battle against the Turks, called out to his comrade that he had caught a Tartar. "Bring him along then," said he. "He wont come," answered Paddy. "Then come along yourself," replied his comrade. "Arrah," cried he, "but he wont let me." A Tartar is also an adept at any feat or game; he is quite a Tartar at cricket, or billiards.

Tawdry. Garish, gaudy with lace or staring and discordant colours: a term said to be derived from the shrine and altar of St Audrey (an isle of Ely saintess), which for finery exceeded all others thereabouts, so as to become proverbial; whence any fine-dressed man or woman was said to be all St Audrey, and by contraction all tawdry.

Tailor. Nine tailors make a man; an ancient and common saying, originating from the effeminacy of their employment; or, as some have it, from nine tailors having been robbed by one man; according to others, from the speech of a woollen-draper, meaning that the custom of nine tailors would make or enrich one man. A London tailor, rated to furnish half a man to the trained bands, asking how that could possibly be done, was answered, by sending four journeymen and an apprentice.

Termagant. An outrageous scold: from Termagantes, a cruel pagan, formerly represented in divers shows and entertainments, where, being dressed à la Turque, in long clothes, he was mistaken for a furious woman.

Thomond. Like Lord Thomond's cocks, all on one side. Lord Thomond's cock feeder, an Irishman, being entrusted with some cocks which were matched for a considerable sum, the night before the battle shut them all together in one room, concluding that, as they were all on the same side, they would not disagree: the consequence was, they were most of them either killed or lamed before the morning.

Toad Eater. A poor female relation, an humble companion, or reduced gentlewoman, in a great family, the standing butt, on whom all kinds of practical jokes are played off, and all ill humours are vented. This appellation is derived from a mountebank's servant, on whom all experiments used to be made in public by the doctor, his master; among which was the eating of

toads, formerly supposed poisonous. Swallowing toads is here figuratively meant for swallowing or putting up with insults, as disagreeable to a person of feeling, as toads to the stomach.

Travelling Piquet. A mode of amusing themselves, practised by two persons riding in a carriage, each reckoning towards his game the persons or animals that pass by on the side next them, according to the following estimation:—

A parson riding a grey horse, with blue furniture; game.
An old woman under a hedge; ditto.
A cat looking out of a window; 60.
A man, woman, and child, in a buggy; 40.
A man with a woman behind him; 30.
A flock of sheep; 20.
A flock of geese; 10.
A post-chaise; 5.
A horseman; 2.
A man or woman walking; 1.

Velvet. To the little gentleman in velvet, that is, the mole that threw up the hill that caused Crop (King William's horse) to stumble; a toast frequently drunk by the Tories and Catholics in Ireland. [It will seem strange that Tories and Catholics should thus be classed together. The explanation is, that the Tories were originally an Irish royalist Catholic party of the time of the Commonwealth.]

Waits. Musicians of the lower order, who in most towns play under the windows of the chief inhabitants at midnight, a short time before Christmas, for which they collect a Christmas-box from house to house. They are said to derive their name of waits from being always in waiting to celebrate weddings, and other joyous events happening within their district.

Wooden Horse. To ride the wooden horse, was a military punishment formerly in use. This horse consisted of two or more planks about eight feet long, fixed together so as to form a sharp ridge or angle, which answered to the body of the horse. It was supported by four posts, about six feet long, for legs. A head, neck, and tail, rudely cut in wood, were added, which completed the appearance of a horse. On this sharp ridge delinquents were mounted, with their hands tied behind them; and to steady them, as it was said, and lest the horse should kick them off, one or more firelocks were tied to each leg. In this situation they were sometimes condemned to sit an hour or two; but at length it having been found to injure the soldiers materially, and sometimes to rupture them, it was left off about the time of the accession of King George I. A wooden horse was standing in the Parade at Portsmouth as late as the year 1750.

ABSENT FRIENDS.

AIR—"The Peacock."

The night has flown wif' songs and glee,
The minutes hae like moments been—
There's friendship's spark in ilka coe,
And peace has blessed the happy scene.
But while we sit sae social here,
And think sic friends we never saw,
Let's not forget, for them that's near,
The mony mae that's far awa.
Oh, far beyond th' Atlantic's roar,
Far, far beyond th' Australian main,
How many fortune's ways explore,
That we may never meet again!
How many nices sat by our side,
Or danced beside us in the ha',
Wha wander now the world sae wide—
Let's think on them that's far awa.

There's no a mother but has seen,
Through tears, her manly laddies gae;
There's no a lass but thinks o' ane
Whase absence makes her often wae;
The ingle sides o'er a' the land,
They now are dowie and dowie a',
For some ane o' the social band
Has left them, and is far awa.

They've left us—but, where'er they be,
They ne'er forget their native shore;
Auld Scotland, mountain, glen, and lea,
They have it pictured at the core;
E'en now, when we remember them,
Our memory they perhaps reca',
And while we fondly breathe their names,
They whisper ours, though far awa.

January 1838.

R. C.

SHOWERS OF FROGS.

A shower of fishes has ceased to be a phenomenon, but a descent of living frogs from the clouds is rather a formidable dispensation. Such has taken place, however, more than once in France, as the following extract from "L'Institut, 166," attests:—

Several notices have lately been brought before the French Academy, of showers of frogs having fallen at different times in different parts of France. Professor Pontus, of Cahors, states, that in the month of August 1804, while distant three leagues from Toulouse, the sky being clear, suddenly a very thick cloud covered the horizon, and thunder and lightning came on. The cloud burst over the road about sixty toises (383 feet) from the place where M. Pontus was. Two gentlemen returning from Toulouse were surprised by being exposed not only to a storm, but to a shower of frogs. Pontus states that he saw the young frogs on their cloaks. When the diligence in which he was travelling arrived at the place where the storm burst, the road, and the fields alongside of it, were observed full of frogs, which equalled in bulk

from one to two cubic inches, and consisted of three or four layers placed one above the other. The feet of the horses and the wheels of the carriage killed thousands. The diligence travelled for a quarter of an hour at least along this living road, the horses being at a trot.

SHOWER OF INSECTS.

In one of the numbers of the "Journal de St Petersburg" we find the following interesting account of the fall of a shower of insects during a snow-storm in Russia:—

On the 17th of October 1827, there fell in the district of Rjev (in the government of Twer), a heavy shower of snow in the space of about ten versts (nearly seven English miles), which contained the village of Pakroff and its environs. It was accompanied in its fall by a prodigious quantity of worms of a black colour, ringed, and in length three quarters of a werschok.* The head of these insects was flat and shining, furnished with antennae, and the hair in the form of whiskers, while the body, from the head to about one-third of their length, resembled a band of black velvet. They had on each side three feet, by means of which they appeared to crawl very fast upon the snow, and assembled in groups about the plants, and the holes in trees and buildings. Several having been exposed to the air in a vessel filled with snow, lived there till the 26th of October, although in that interval the thermometer had fallen 8 degrees below zero. Some others which had been frozen continued equally long in life, for they were not found exactly encrusted with the ice, but they had formed round their bodies a space similar to the hollow of a tree. When they were plunged into water, they swam about as if they had received no injury, but those which were carried into a warm place perished in a few minutes.

A HINT TO TEA-DRINKERS.

The invaluable beverage, tea, sometimes produces injurious effects, more particularly green tea; and this arises from its containing a considerable quantity of free gallic acid. The fact may be rendered evident by adding to an infusion of the leaves a few drops of a solution of green copperas, which will turn the liquid black. This acid is a powerful astringent, and in peculiar habits is productive of much inconvenience. To prevent any evil effects, a few grains of carbonate of soda, mixed with the tea, will be found an infallible specific. The acid and alkali by their union form a neutral salt of mild but effective virtues. The quantity of acid contained in tea may be fairly estimated by noticing the effervescence which occurs when carbonate of soda is added to the infusion. The deep colour of the latter is greatly increased by the alkali, and its taste is not only uninjured by it, but some think actually improved.

* A Russian werschok is equal to one inch and three quarters of English measure.

PEOPLE'S EDITIONS.

A TOUR IN HOLLAND, the COUNTRIES on the RHINE, and BELGIUM, in the Autumn of 1838, by WILLIAM CHAMBERS, one of the Editors of Chambers's Edinburgh Journal, is now published (Price 1s. 6d.), and may be obtained from any bookseller.

The work consists of the series of papers which lately appeared in Chambers's Journal, under the title of "A FEW WEEKS ON THE CONTINENT," but in a considerably extended form, comprehending a variety of details, matters of fact and opinion, which, for the sake of brevity, were omitted in the original. It is issued in connection with the series of reprints of approved works, now publishing by Messrs Chambers under the title of "People's Editions."

Of this series of publications, the cheapest and most comprehensive ever issued in Great Britain, and designed to facilitate the formation of Libraries for Parishes, Mechanics' Institutions, and in the houses of the less affluent members of the community, the following are now issued:—

TRAVELS IN RUSSIA, TARTARY, and TURKEY. By Edward Daniel Clarke, LL.D. With a Memoir of the Author, and numerous Additions and Notes, prepared for the present edition. Price 2s. 6d. Published originally at Five Guineas.

THE COMPLETE ENGLISH TRADESMAN. By DeFoe. With Notes and Additions. Price 1s. 6d.

PALEY'S NATURAL THEOLOGY, improved, by Notes and additional Matter. 1s. 6d.

MARMION, a Tale of Flodden Field. By Sir Walter Scott. 10s.

LAY OF THE LAST MINSTREL. By Sir Walter Scott. 7s.

LADY OF THE LAKE, a POEM. By Sir Walter Scott. 8d.

THE COTTAGERS OF GLENBURNIE. By Mrs Elizabeth Hamilton. 8d.

CRABBE'S PARISH REGISTER and OTHER POEMS. 6d.

FRANKLIN'S LIFE and MISCELLANEOUS WRITINGS, greatly extended. 1s. 6d.

LIFE and TRAVELS OF MUNGO PARK (Complete). 1s. 6d.

With an Account of AFRICAN DISCOVERY from the time of Park till the present day. 1s. 6d.

BUTLER'S ANALOGY OF RELIGION. 1s. 2d.

THE VICAR OF WAKEFIELD, by Goldsmith. 8d.

ANSTER FAIR, and OTHER POEMS. By W. Tennant. 8d.

ADVENTURES OF RODERICK RANDOM. 1s. 8d.

ESSAYS, MORAL, ECONOMICAL, and POLITICAL. By Lord Bacon. 8d.

RAMSAY'S SELECT POEMS, including his GENTLE SHEPHERD. 8d.

ADVENTURES OF ROBINSON CRUSOE. 1s. 8d.

THE LIFE OF ROBERT BURNS. 1s. 3d.

THE POETICAL WORKS OF ROBERT BURNS. 2s.

THE PROSE WORKS OF ROBERT BURNS. 1s. 8d.

THE IMPRISONMENTS OF SILVIO PELLICO, a New Translation for the present edition. 9d.

Will be ready in June.

TRAVELS IN THE EAST, including a JOURNEY IN THE HOLY LAND. By A. LAMARTINE. A New Translation from the French. Price about 3s. 6d. or 4s.

LONDON: Published, with permission of the proprietors, by W. & O. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

PRICE THREE HALFPENCE.

STEAM-BOAT CHARACTERS.

A TRIP from Edinburgh to London on board one of the many splendid steamers which ply almost daily between these cities, is, in fine weather, a very delightful affair. The pleasures of the sea are enjoyed without any thing like actual fear of danger; for so well are these boats manned and managed, that even when the ocean roars and tosses itself about in a pretty considerable fury, you may keep yourself quite at ease on the score of drowning. Then, as you have something like forty-eight hours to spend on board, a period which includes two breakfasts and dinners, not to speak of three lunches and as many teas, there is time to look about one, and scrape up a sort of chatting acquaintance with one's fellow-voyagers. From the moment you get yourself on board, to the moment you step on shore, all is a mere round of idling, eating, drinking, talking, walking, and sleeping. Exhilarated with the fresh air of the North Sea, and watching the progress of the vessel along the coast, you get in a few hours a first-rate appetite, and lay waste every thing that the steward thinks fit to exhibit for your solacement.

In these excursions, to be sure, there are occasionally a few roughs—all is not smooth sailing. The deck sometimes will persist in see-sawing off the horizontal—the timbers of the berths below will go on creak-creaking, as if the vessel were sulkily muttering threats of parting asunder; cries of woe-begone rights for the steward to fetch—no matter what, issue from the sarcophagi, flatteringly called beds. All this, and much more to the same purpose, will now and then take place. What then!—it is only for a day or so, and you have a good laugh at it afterwards. If one chances to be in the humour, he may also pick up a good deal of character, in a small way, in these sea-trips. I say, in a small way, for there is no opportunity for great things. In a few little odds and ends of sayings and doings, you can observe what sort of stuff a person is made of. One takes every thing easily and makes no fuss, while another is restless and fidgetty, full of important trifling, and is a bit of a bore. Among this latter class of torments down in the sleeping-berths, I reckon the bald-pated, red-gilled, middle-aged gentleman, in the dressing-gown and slippers, who keeps washing at himself, and fiddle-faddling about the basin-stand, for pretty nearly a couple of hours. This basin-monopolising monster, as we may call him, is an awful infliction upon the inmates of the sleeping-room. Up he gets before any one else, and, securing a position at the only dressing-table in the apartment, there he washes and splatters away till your patience is quite exhausted. Suddenly the noise ceases; you think he has done; looking out of your berth, however, you see he is only resting one side of his head in the basin; then he rests the other; then he submerges his big round red face; then commences the splashing once more; and, at last, after a very great splash of water has been tossed round the back of his neck, he finishes, and takes to the towel. The towel he is as severe upon as he has been upon the water. He takes five-and-twenty minutes to dry himself. And even after the water and the towel have been dismissed, he has to go through a variety of manoeuvres with sundry little bottles, brushes, and other articles, all ingeniously packed into each other in a portable dressing-case, which he has spread out on the top of a trunk; then he has to begin dressing himself in earnest in his upper apparel, and, just as you hear the clatter of cups up stairs for breakfast, he vacates the premises, and leaves the coast clear for others. Such is this pest of steam-boats, the basin-monopolising monster.

You may hold yourself fortunate if you escape an equally formidable bore in the character of the snoring monster. This is a puffy fat person, who devours beef-steaks at breakfast, calls for pints of stout at dinner, eats a hearty supper, and drinks a tumbler of punch before going to bed. He has obviously the stomach of a cassowary, and he chucklingly tells every one about him that he is never sick. Following him to the berths below, you find he does not undress like other mortals; but selecting a bed in the free and easy way that a backwood squatter selects a location, he tumbles in, boots and all, and in three minutes is off in a snore, which the noise of the paddles has not the power either to quell or disturb. Varying the tone from a high and sharp to a low and guttural key, there does the monster go through his gamut of horror, laying waste the slumbers of his neighbours, and only ceasing when he again squelches out from his den to seek the regions above. Reader, you know the snoring monster too well. Let us proceed to some one else.

Among the concourse of characters, gentle and simple, who figure in the saloon, you cannot fail particularly to observe one whom the functionaries of the vessel and various passengers look up to as the greatest man in the ship. This greatest-man-in-the-ship monster is generally a lord; perhaps he is only a judge, perhaps only a general; no matter, he is somebody of rank, a personage whom many are anxious to sit near, and help to all the good things within reach. Gruff as the captain may be to every one else, he is politeness personified to the greatest-man-in-the-ship monster—readily tells him where we are, how far we shall be next morning, and when, if no fog comes on, we shall arrive at our destined port. To those, therefore, who wish to pick up crumbs of information regarding the progress of the voyage, it is of material importance to be locally near the greatest-man-in-the-ship monster, whose conversation, moreover, though sometimes very sparingly bestowed, must, as a matter of course, be of a singularly illuminative kind. It is quite delightful, after the slightest possible remark that may have fallen from his lordship, to observe how greatly edified and impressed the other passengers appear.

In respect of talk, the greatest-man-in-the-ship monster usually differs very much from another class of passengers, now to be adverted to. It is the chief peculiarity of these gentlemen to talk very much, and in a loudish voice, as if they were desirous of letting all their fellow-voyagers know who they are, and where they have come from. To be exact, they consist of some half dozen gentlemen who have either lately returned from India, or who were in India at some former period of their lives. I speak of a down voyage, not an up. In going up, the vessel carries young cadets and assistant-surgeons recently appointed, who are on their way to Chatham to be passed and forwarded. It is in the down voyage that you fall in with the old Indians. They always, by a kind of sympathy, congregate in a coterie at the top of one of the tables, whence comes an endless flow of loudish chatty conversation on matters connected with the East, and a few things besides.

"Were you on the Madras station, Colonel?"

"No, I was in Bengal. I went in the year 1809, and have just been thirty years out."

"Indeed, that's a long time; I returned in 1827. I was only out seven years, but I was up the country. I did not like the lower provinces; they are too hot. How did you come home?"

"We came, my friend and I here, in the Masulpatam—a splendid vessel that, a thousand tons, India built, first-rate provisions on board. We had a garden

of water-cresses on the poop, and fresh milk daily from a couple of cows."

"That was capital. Did you touch at the Cape?"

"Yes, we were there a week. Fine country, but an awful state of morals. A brutal set the Dutch boors; they are constantly at war with the natives. A short time before we arrived, there had been a skirmish within the Caffre territory. Two thousand of the poor devils were killed, and we lost only one serjeant, a corporal, and fourteen rank and file. Captain Shaw of the 6th was wounded."

"Oh, speaking of that, did you know Major Shaw of the Royals? He was on the Bengal station, I think."

"I knew him very well. He came out in twenty-six, and was married at St Helena, by the way, to a daughter of Captain Davidson—a fine-looking girl, but somewhat passé."

"That was an excellent joke; was the major not laughed at a good deal at the mess?"

"Oh, not at all; there were others in the same scrape. It is quite a common thing to be married at St Helena, or, at all events, at the Cape, on the way out. The matches, you know, are made up on board. Besides, she was an old flame. The major had flirted with her a year or two before at Cheltenham."

"Ah, that makes a difference. You have been at Cheltenham, I suppose, since your return; excellent society there, particularly in summer."

"No, I prefer London, and intend going back in a few weeks. So many club-houses now, that one can never be the least at a loss for acquaintances. I staid a month at the United Service—the old, not the new—a first-rate house that. I met an old friend there, General Montgomery; we were school-fellows in Scotland more than forty years ago. He had returned only a short time since from the Ionian Islands, where he had a good appointment."

"London is very dull at present—nothing doing."

"Why, you astonish me; I was driven utterly stupid with the noise and bustle on the streets, and there seems to be plenty of amusements of all kinds; all the theatres are open, I believe."

"Oh, as for that, I dare say London is always much the same. I meant there were no drawing-rooms or levees worth speaking of. But that is rather a ticklish subject just now."

"Perhaps. You know I am as yet somewhat raw in court matters. What a great convenience to strangers is that Parcels' Delivery Company they have got up in London."

"I did not hear of it."

"It is new, I am told; you can get as many parcels delivered as you like in any part of the town for three-pence a-piece. I sent, I dare say, a cart-load of odds and ends one day. Vast convenience, I assure you—as good as the twopenny post."

"Great bore bringing home presents. Of course you were loaded like an elephant. I suppose you brought home a native servant?"

"No, I hired an Englishman who had gone out as an emigrant to the Cape a few years ago. India is now pretty well supplied with persons of that description."

"Indeed, that was not the case when I was out. Nothing then but native servants to be had. They are very clever, but sometimes shockingly roughish. I remember one of our mess who had two teeth stolen out of his head while asleep by his servant. They, however, make capital barbers. It is almost worth a person's while to go to India for the luxury of shaving."

"I agree with you in that. After experiencing the delicate operations of the Bengalese barbers, I feel myself sadly at a loss in this country. I cannot tell how I am to endure the change of manners after such an absence."

"It was certainly a desperate long stretch for you, thirty years. Surely you had a break. Did you stand the climate well?"

"No, I had no break; as for the climate, I stood it not amiss. I was very careful. Fourteen years ago, I had a dreadful country fever when stationed at Pishawar, but I got through it pretty well. I thought of coming home for twelve months, but the Burmese affair broke out, and we were ordered off to a hill-station on the frontiers, where I got as stout as a buffalo."

"Excellent hunting at the hill-stations, I understand."

"Why, yes, for those who like it; but we were so much occupied that we had little time to think of any thing of the kind. The mountains and heaths—we were two thousand feet high—reminded me of Scotland; but the air is different. I often thought when lying knocked up in my tent, that is, before I got well, that if I could but feel a breeze blowing up the Firth of Forth, from the Bass rock, I should instantly recover."

"I rather think we are not far from the mouth of the Firth now, but it will be so dark soon that the Bass will be but barely visible. However, we shall be at Granton in good time."

"I thought we were to go into Leith."

"Oh no; this is one of the General Steam Navigation's boats, and they all go into Granton."

"Where's that? I don't remember it."

"It's a new pier built entirely at the expense of the Duke of Buccleuch, about two miles west from Leith, with a new road striking up to Edinburgh. It is a splendid undertaking, by far the grandest ever executed by a private individual in Scotland. I am told it is to cost at least a hundred and fifty thousand pounds—quite a public-spirited affair, like the Duke of Bridgewater's canals."

"Will it pay?"

"That's doubted, but much is expected by the duke from the ground-rents of a new town springing up on the spot. The pier, at any rate, is an immense convenience. It is all of stone, a quarter of a mile in length, and has deep water for the largest steamers at all times of the tide."

"Well, I am glad we are not to go on shore in small boats. I hate these things, when there is a crowd of people; they cause so many accidents."

"They do. Did you lapd from the Masulpatam at Portsmouth?"

"No, I was put ashore at Brighton. My brother, who is the only relation I have left, has a very pretty house there, and I wished to see him the first thing I did on landing in England."

"It would be a great surprise when you popped in upon him. I should have liked to have seen how he looked."

"It was evening when we arrived. I had my servant with me. It was a little darkish, as it is just now. My brother and his wife were both out, but I asked to see the children. I was shown up to the nursery, and there were half a dozen of them, all as happy as possible. They were being put to bed, and could not understand who I was, although I told them I was their uncle. They could not rightly comprehend the idea of an old white-haired fellow like me claiming relationship with them. But I knew in a moment who they were. Their likenesses renewed old recollections. The sight of them was too much for me. There, in a beautiful flaxen-haired child, was the face of my poor mother, as I remembered having seen her for the last time at parting for India. There, also, in a brisk little fellow, standing on the top of a chair, was the countenance of Walter, a dear brother who fell at Bergen-op-Zoom. I saw, likewise, as I thought, the resemblance of my sister, who died a few years after my mother in Scotland. I felt myself, as it were, carried to heaven, and placed in a company of little angels, representing the deceased relations that I had valued on earth. I declare I sat down and wept like a child."

With this unexpected bit of sentiment from the old Indian, we conclude our snatch of steam-boat conversation; for, lo! Granton-pier is at hand, and the

temporary bond which has kept a few strangers together during the voyage, is already dissolved, as every man has to scamper away to see after his luggage, and make the best arrangements he can for his further progress on shore.

SKETCHES IN NATURAL HISTORY.

CATTLE, TAME AND WILD.

THE great importance of our domestic cattle may well be presumed to assure us that the greater part of our readers will feel some interest in the natural history of the genus to which these animals belong. To this department of zoology we have also a special call, in our desire to present, in a popular form, a view of some recent inquiries into the history and nature of certain breeds of wild cattle which are still kept up in our country. Partly, therefore, as introductory to a sketch of these wild cattle, and partly on account of its own interest as a department of natural history, we venture on the present occasion to lay before the reader a brief general paper on CATTLE TAME AND WILD.

The genus *Bos*, in which these animals are included (a genus of the mammal order RUMINANTIA, or Cud-Chewing Animals, which embraces likewise all the various kinds of camels, stags, goats, and sheep), was supposed by Buffon to consist but of two species, the Bull and the Buffalo. So great, however, has been the progress of science since the days of that eminent naturalist, that the acknowledged species are now at least nine, namely, the *Bos Taurus* (Common Bull or Ox), the *Bos Grunniens* (the Yack of Central Asia), the *Bos Bubalus* (Buffalo), the *Bos Arnee* [the preceding are tame or tameable—what follow are wild], the *Bos Urus* (Aurochs), the *Bos Americus* (American Bison), the *Bos Moschatus* (Musk Ox), and the *Bos Caffer* (Cape Ox).

1. The *Bos Taurus* comprehends not only our own domestic cattle, but most of those of continental Europe, of Asia, Africa, and America. It is a species, then, of a great number of varieties. Not only does it include the many different British breeds, as the Long-horned or Lancashire, the Middle-horned or Herefordshire, the Short-horned or Dutch stock, the No-horned or Galloway, the Devonshire, the Welsh, and the Highland breeds, the Suffolk Duns and the Little Alderney, but the corresponding breeds, as they may be called, of the favourite localities of all other countries—as those of France and Holland, where about thirty kinds have been enumerated, those of Spain, of Germany, and Italy; also the gigantic animal of the Romania and the Calmuck Tartars, and the diminutive Shetlander; the domestic cattle of Egypt and North Africa, spreading, in the opinion of Major Hamilton Smith, southward to Caffraria; those, too, whose skeletons have been buried for ages in the Egyptian catacombs, and those which were derived from and extend to India, including the *Zebu*, with its hump on its back, in its many varieties. Though this arrangement is not free from acknowledged difficulties, and though it is far from being well understood "what forms a species, and what a variety," yet naturalists, following Baron Cuvier, are nearly unanimous in grouping all those under one species, and in this arrangement they are supported by scientific agriculturists.* All these varieties very much agree in their anatomical structure, in their mental endowments, and dispositions; they freely consort together; and their produce, instead of being a hybrid or mongrel race, have qualities equal, if not superior, to their own.

The external appearances, and the dispositions of many of these domestic varieties, must be so familiar that it is unnecessary to dwell upon them. The *Zebu* is not unfrequently seen in this country. There are several varieties, which, however, differ only in size, the largest and rarest exceeding the ox in dimensions, whilst the smallest is not bigger than a hog or large dog. It is used in some parts of India for carrying burdens, instead of horses, and is far more swift and hardy than the cow, trotting off with as much speed as a horse, and pursuing long journeys. Herds even of these domestic breeds are sometimes found to be very frisky. We remember some years ago visiting the stock of an extensive breeder in the north of England, where there was a considerable number and variety of cattle, and among the others a *Zebu*. Some dogs accompanied us to the enclosures, which was no sooner observed by the cattle, than they were greatly excited, and instantly collected, and came galloping towards us. The dogs retreated among our feet for protection, and the cattle,

nothing daunted, continued their attack, wheeling frequently so wildly round us, always approaching, and with such bold and threatening bearing, that we were too happy to make a somewhat precipitate retreat. Such an occurrence as this is probably familiar to many of our readers, but as its parallel will ere long be introduced in connection with reputed wild breeds, we have thought it not amiss to notice it. The *Zebu* above alluded to associated readily with our common breeds, and crosses were obtained from it; but both it and its progeny were so active and restless, not to say wild, in their habits, that they were on this account found inconvenient, and the race was not perpetuated. Every one is aware of the wide difference which subsists between the mild disposition of the cow, and the occasional outrageous fury of the bull.

2. The second species of domestic ox occurs in Thibet and Central Asia, and is known under the name of *Yack*—the *Soora Goy* of Hindostan, the *Bos grunniens* of Linnæus—that is, the *Grunting Ox*, or rather, according to Major H. Smith, it should be *groaning*, for its voice is very different from the grunting of a pig. We will not dwell upon those characters upon which naturalists conceive they have based satisfactorily its specific distinctions, and shall only mention that its brow is prominent and not flat, and that it has fourteen ribs, whilst the other has thirteen. It has a strong general resemblance to the former species. Its horns are round; its ears small; its forehead adorned with frizzly hair, with an elevation on its shoulders more than the regular hump of the *Zebu*; its limbs are short, and the tail ornamented, from root to tip, with long, tufted, and brilliant hair, one pile of which in the British Museum measures six feet in length. In its domestic state, the *Yack*, like the *Bos taurus*, is liable to numerous varieties of general size, of the magnitude of its horns, or their entire absence, of that of the hump, and as to its colours and markings. It is this species which produces the famous *horse-tails* (commonly so called) which are used as standards by the Turks and Persians. The *Chowries* or "fly-drivers" of the East, much employed in India, are also formed from the tail of the *Grunting Ox*. It is dyed red by the Chinese, and is worn as a head ornament. This animal has a downcast heavy look, is sullen and suspicious, and usually exhibits considerable impatience on the near approach of strangers. It is sure-footed, and thus an excellent beast of burden, but is not used in agriculture. The mountains of Bhotan and Thibet offer the principal retreat to the wild varieties. There, too, also, they are domesticated, and they spread thence over China and Central India. They also abound in the Altaic mountains, and supply milk, &c. to the Calmucks, Mongolians, and Tartars.

3. The third domestic ox, the *Tame Buffalo* (*Bos Bubalus*, Linn.), seems originally to have been a native of Eastern Asia and its archipelago. It is well known in China and Cochinchina; it is the principal beast of burden in Sumatra and Java, and is the common animal food. In Ceylon it is found both tame and wild. It abounds in Malabar, Hindostan, and Coromandel, also in Persia and the Crimea. It seems to have been introduced into Europe about the seventh century, and was unknown to the ancients, whilst it is now common in Egypt, Greece, and Italy. The Lombard historian Warnefried informs us that their appearance in the last named country excited the greatest surprise, whereas they now graze unheeded in numerous herds in the Pontine marshes. Their milk is excellent, their hide very strong, their flesh but slightly esteemed. The forehead of this animal is convex and bulging, and higher than broad. In its habits it is almost amphibious, and it is peculiarly fond of the long rank herbage which springs up in moist and undrained lands. Hence its love of the Pontine marshes, where, according to Scaliger, it will lie for hours, submerged almost to the muzzle; a habit which, according to Dr Quoy, it equally exhibits in the Isle of Timor, in the Southern Ocean. This animal, even when domesticated, is far from docile, and it is so vigorous and bold that it fears not the lion or tiger, or any other wild beast of the forest, and an Indian herdsman reclined on its back is not afraid to pass the night in the most dangerous jungle. Its courage is well illustrated by the following incident, related by Mr D. Johnson. Two carriers were driving a loaded string of these animals from Palamow to Chittrah. When within a few miles of the latter place, a tiger seized on the man in the rear, but not unnoticed by a herdsman who was watching the buffaloes grazing: he boldly ran up to the man's assistance, and cut the tiger very severely with his sword, upon which it dropped the carrier, and seized the herdsman. The buffaloes, witnessing this, immediately attacked the tiger, and rescued the herdsman; they tossed it about from one to another, and, to the best of my recollection, killed it. Both the wounded men were brought to me: the carrier recovered, but the poor herdsman died."

4. We now introduce to notice two kinds of animals, which by some are regarded as quite distinct species from the preceding, whilst by others they are esteemed as varieties only of the tame buffalo. This is the opinion of the late Baron Cuvier, and we shall follow in

* See Quarterly Journal of Agriculture, ix. 308.

* Griffith's Cuvier, iv. 383.

his wake. These are a buffalo designated the *Arnée*, or *Arnis* (*Bos Arnis* of Shaw). This animal, though not unknown to the older authors, was first particularly described by the celebrated Pallas, and brought under the notice of the British public by Dr Anderson in the "Bee," in the year 1792. There seem to be several varieties of this animal, which differ from each other, more especially in size; and one, from its dimensions, is called the *Gigantic* or *Taur-Elephant*; the other, and more common, agrees in size with the common buffalo. The horns are the most striking characteristic of these creatures, each of them frequently extending to the prodigious length of about six feet; they are crescent-shaped, and turned outwards and backwards. It is a native of China and India.

5. The second variety we notice is the domestic animal named *Gayal* in the eastern parts of Bengal, and which has been described by Mr Lambert* under the name of the *Bos frontalis*, and by Major H. Smith as the *Gavvus*. In size and form it is not very dissimilar from the English bull; it has a dull and heavy aspect, but in reality equals the buffalo in activity and strength. Its horns are short, slightly compressed, thick at the base, rising directly outward and upwards; there is no hump upon its back; the milk, though rich, is not abundant. It is this variety which is more especially venerated by the Hindoos.

WILD OXEN.—We now turn to the Wild Oxen, and the first we shall name is (6) the *Aurochs* (*Bos Urus*, Gmel.), the only ascertained and indisputable wild ox of Europe, extending also to Asia. Its German name *Aurochs*, sometimes spelt *Auror*, is probably a corruption of *Urus*, a name originally applied to another species. After the rhinoceros, this is the largest and most massive of our quadrupeds. It stands high on its legs, often equalling six feet at the withers, and being between ten and twelve feet in length. Its forehead bulges and is convex, and is broader than high; its horns are black, and of middling dimensions. It has fourteen ribs, instead of thirteen, as in the domestic breeds, and its skin is much thicker than that of other oxen. Its coat or fur is composed of two kinds of hair, both soft and woolly, the one short and fawn-coloured, the other long and chestnut-coloured: the hair is longest in front about the neck and shoulders, where it is four times longer in the male than in the female; the head and tail are long. Certain portions of the hide, especially about the head, have a decidedly musky smell, and the name *Bison* is supposed to have been bestowed upon it in consequence of that odour—the German word *weisen* or *bisem* signifying musk. The tone of its voice is quite peculiar. These characters mark it as a distinct species, and prove to the conviction of competent judges that it could never have been the stock of our present domestic breeds, whilst its history shows it has never been subdued. It is a wild and independent animal, which has been hunted from the more favoured countries of Europe, and is now confined to the forests of Bialowiza in Poland, and to Lithuania, also to Moldavia and Walachia, and to the confines of the Caucasus. Gilibert had an opportunity of observing the manners of four young ones. They refused to suck a cow, but were at last induced to receive nourishment from a she-goat placed, for their convenience, on a table. As soon as satisfied, they sometimes tossed both nurse and table to the distance of six or eight feet. On the termination of the first year, the small manes of the cows made their appearance. Like all the rest of the breed that have ever been observed, they scornfully refused the society of the domestic cattle of either sex, driving all other cows from the pasture in which they were kept. In other respects they were docile and obedient, caressed their keeper, and came to him when they heard his voice. Dr Javoki stated to the meeting of naturalists at Hamburg, in the year 1830, that the wild oxen of Bialowiza live in herds, except a few of the older ones, which wander about singly. Though they have never been tamed, they are not so shy but that they may be approached within a moderate distance. Each herd keeps constantly to the same district of forest, near to some river or stream, so that each of the twelve foresters knows the herds which belong to his district. The whole number, at present, is estimated at somewhat above seven hundred. The cows rarely bring forth above one in three years; the calves suck nearly a twelvemonth; they continue to grow for six years, and live for forty.

7. The next wild animal to which we shall advert is the *American Bison* or Buffalo, as it is called (*Bos Americanus*, Gmel.), which, although in some respects resembling the *Aurochs*, is usually distinguished from it. Baron Cuvier compared their skulls, and remarked that the one might almost be taken for the other, there not being greater differences between the *American Bison* and the *Aurochs*, than there is between one *Aurochs* and another. In opposition, it is said that the *American Bison* has fifteen ribs, whilst the European has only fourteen. Regarded externally, there are marked differences, both in appearance and habits. According to Dr Richardson, in his Account of his Arctic Expedition, it is a fierce, treacherous-looking animal, with a disgusting and sinister look; the head and fore-quarter is large, and appearing more so from the long shaggy hair which covers the head and neck, almost obscuring its small bloodshot-looking eye. The horns are small, tapering, and acute, and set far apart. The height at the shoulder, where it has a hump, is upwards of six

feet, whilst its hinder part appears relatively small and feeble: the tail, which is covered with long hair only at the tip, does not extend below the knee, whilst that of the *Aurochs* is covered with long hair throughout, and sweeps the ground. The skin, from its fine wool, makes an excellent blanket, and sells in Canada for three or four pounds, and the wool has been manufactured in this country into fine cloth. Its usual colour is amber-brown; its flesh is much esteemed, and its hump is manufactured into the highly prized pemmican. It wanders constantly from place to place, either from being disturbed by the hunters, or in quest of food. Bisons are much attracted by the soft tender grass which springs up after a fire has spread over a prairie. In winter they scrape away the snow with their feet to reach the herbage. The bulls and cows live in separate herds for the greatest part of the year; but at all seasons, one or two bulls generally accompany a large herd of cows. During a certain season the males fight with great fury, and at that period it is very dangerous to approach them. The *Bison* is, in general, however, a shy animal, and takes to flight immediately on *winding* an enemy, which it does from a great distance: they are less wary when assembled in numbers, and will often blindly follow their leaders, trampling down the hunters posted in their way. It is dangerous for the hunter to show himself after having wounded one, for it will pursue him; and although their gait may appear heavy and awkward, it will have no great difficulty in overtaking the fleetest runner. One of the Hudson-Bay Company's clerks was descending a river in a boat, and having one evening pitched his tent for the night, went out in the dusk to look for game. It had become very nearly dark when he fired upon a *Bison* bull which was galloping over a small eminence, and as he was hastening forward to see if his shot had taken effect, the wounded beast made a rush at him. He had the presence of mind to seize the animal by the long hair on the forehead, as it struck him on the side with its horns, and, being a remarkably tall and powerful man, a struggle ensued, which continued till he was disabled. He then fell, and, after receiving two or three blows, became senseless. Shortly afterwards he was found by his companions, lying bathed in blood, and the *Bison* was couched beside him, apparently waiting to renew the attack, had he shown any signs of life. The principal habitat of this animal at present is the immense country which gives rise to the sources of the Mississippi and Missouri; some generations back they used to be found in Carolina, Kentucky, and Pennsylvania, whence they have retreated. They abound in innumerable troops, sometimes exceeding 10,000. They are not found in the southern parts of the United States, nor in Mexico.

8. North America, in its higher latitudes, is famous for another kind of wild ox known under the name of *Musk Ox* (*Bos Moschatus*, Gmel., or *Ovibos Moschatus* of Dr Blainville). We owe our systematic knowledge of this animal to Pennant, and specimens have long existed in the Museums of Edinburgh and London. Captain Parry encountered it in his expedition, and has supplied satisfactory information respecting it. When full grown, it is about the size of the small Highland cattle. Its flesh is good, but smells strongly of musk. The horns are remarkably broad at their bases, and cover the brow, being in contact with each other; the nose is blunt, the muzzle covered with short hair, the head is large and broad, the legs rather short. The general colour of the coat is brown. On the neck, and between the shoulders, the hair is long and somewhat curled; on the back and flanks it is also long, but lies smooth, and is so long as to hang down beneath the middle of the legs; the tail is so short as to be concealed by the fur. The *Musk Ox* inhabits the barren lands of America lying to the north of the 60th degree of latitude, and ranges over the islands in the neighbouring ocean, without extending to Greenland and Spitzbergen. They frequent a country destitute of wood, rocky and barren, and feed on grass and lichens. They group in herds of thirty or forty, and are hunted by the Indians and fur-traders for the sake of their flesh and hides. Their sense of smell is excellent, whereby they anticipate and avoid danger in an astonishing way. The *Musk Ox* is of a more placid temper than some of its congeners, and an expert Esquimaux does not fear to encounter it, dexterously avoiding its rush, and inflicting wounds which are usually fatal.

9. The only other distinctly recognised species which remains to be noticed, is the *Cape Buffalo* (*Bos Caffer*, Sparman), an animal which has sometimes been confounded with No. 3, but which is a very different animal both in appearance and disposition, and which has never been domesticated or tamed to labour. It is nowhere to be found but in the southern parts of Africa, and is now rare even there, civilisation driving it into more distant and secure retreats. It is characterised by its great dark rough horns spreading horizontally over the summit of the head, latterly with the points turned upwards. These horns are extremely heavy, and measure from five to eight or nine feet, following their curve from tip to tip. The countenance of the animal exhibits a savage and malevolent expression. Its bulk is great, and this is equalled by its activity and strength: its withers are high; its tail resembles that of the common ox, but is shorter; its hide is unusually strong, and is on this account much valued. It is of so fierce and treacherous a disposition, that its attack is dangerous, without caution and ready means of escape. This is

well illustrated by the following history. A party of boors went out to hunt a herd of buffaloes which were grazing on a piece of marshy ground. As they could not conveniently get within shot without crossing a marsh, which did not afford a safe footing for their horses, they agreed to leave them in charge of the Hottentots, and to advance on foot, thinking, that if the buffaloes should turn upon them, it would be easy to retreat by escaping across the quagmire, which, though passable for man, would not support the weight of heavy quadrupeds. They advanced accordingly, and under covert of the bushes approached with such advantage, that the first volley brought down three of the fattest of the herd, and so severely wounded the great bull leader, that he dropt on his knees, bellowing furiously. Thinking him mortally wounded, the foremost of the hunters issued from the covert, and began reloading his musket, as he advanced to give a finishing shot; but no sooner did the infuriated animal see his foe in front of him, than he sprang up, and ran furiously upon him. The man, throwing down his gun, fled towards the quagmire; but the beast was so close upon him, that, despairing of escaping in that direction, and turning suddenly round a clump of copewood, he began to ascend a tree. The raging animal, however, was too quick for him, and, bounding forward with a frightful roar, he caught the unfortunate man with his terrible horns just as he had nearly escaped his reach, and tossed him into the air with such force, that the body fell dreadfully mangled into a cleft of the tree. The buffalo ran round the tree once or twice, apparently looking for the man, until, weakened with loss of blood, he again sank on his knees. The rest of the party, recovering from their confusion, then came up and dispatched him, though too late to save their comrade, whose body was hanging in the tree quite dead.

A TALE OF BOULOGNE.

"Do you know the difficulty of the task you propose to undertake, Otway?" said one of a party of young Englishmen, who were lounging and chatting together in a corner of the most fashionable public room of Boulogne.

"I do not see any particular difficulty in the matter," replied the individual addressed. "The women are women, I suppose, and have all the peculiarities of their sex; it is probable, in sufficient strength and prominence; wherefore, I am free to confess, as they say in a certain house over the water, that my experience does not lead me to anticipate any gigantic obstacles in the way of making the acquaintance of these two ladies, who seem to have excited so much curiosity among you good people, resident at this time, for various satisfactory reasons best known to each, at the town of Boulogne."

Having many of them very especial reasons for a temporary trip across the Channel, the young men laughed heartily at the innuendo conveyed in Otway's words, and the first speaker resumed the conversation. "You depend on that smooth face and those handsome limbs of yours, Otway; but you are a new-comer, otherwise you would know that these goodly gifts of yours will be utterly thrown away in this attempt, seeing that the two fair dames of the chateau never admit visitors to speech of them, and prevent such a thing happening accidentally, by never crossing the threshold of their rickety tenement. All your precious endowments, therefore, Master Otway, would be lost here—vain and profitless entirely. Give up thoughts of this wild-goose adventure in time, my boy, and do not make people laugh at you for your presumption in attempting what others have failed in."

"You but raise my curiosity more and more," said Otway; "and I *will* and *shall* see these mysterious demoiselles." "You will *try*, you mean, to see them," returned the other. "I will both try and succeed," was Otway's rejoinder. "For a wager of a dinner and wine to all here, you find yourself just where you are with these ladies, two months after this date! Will you risk as much upon it, Otway?" "Why, though an Englishman, you know that I am no bet-maker; yet I will take you at your offer, before these witnesses." "Nay, we shall have more witnesses," cried the other gaily; "all at present in this room must share socially in the good wine and viands, which your purse, I fervently hope and believe, is doomed to pay for." As he spoke thus, the bet-proposer turned round to those who, though in the apartment, had not been near enough to hear what had passed, and exclaimed in a loud voice, "Know all here present—" "Stop, stop," cried Otway; "remember, if I seek the acquaintance of these ladies, I shall do it respectfully; and although I have been foolish enough to bet upon the subject, I would not have the feelings of people of honour and repute, as they may be, hurt by such public—" "Phaw!" said the other, interrupting in his turn; "these ladies never speak to mortal creature, and cannot be annoyed by any thing of this kind. Besides, the proceeds of all bets that involve things edible and potable, must be shared in common, according to the laws of our society." "Go on, then, in folly's name," cried Otway, who saw that he might fall under the stigma of stinginess by further opposition. Accordingly, in a few moments the whole club of idle loungers at Boulogne were made aware of the bet, and all connected with it.

Stephen Otway, a young man of independent fortune,

* *Linnæan Society Transactions*, vii.

† *Edin. Journ. of Nat. and Geogr. Science*, iii.

had just completed a rambling tour on the continent, when the scene took place which has been described. On considering what had passed, he had too good a heart as well as head, to be quite pleased with the publicity which had been given to the matter, particularly as persons were implicated in it of whom he knew nothing. But his curiosity had been greatly raised by the account given to him of these persons. Two English ladies, he was told, had recently taken up their abode in an old and long unoccupied chateau, distant little more than a league and a half from Boulogne. At first, they had walked out a little; but when some of the loungers of Boulogne, having heard of their arrival, had presented themselves in the neighbourhood of the chateau, the ladies gave up their strolls, and never showed themselves without the walls of their dwelling. One of the females was elderly, the other young and exquisitely beautiful, and the attire and deportment of both evinced that they were no inferior personages. Such was the report, at least, of the intruders alluded to, who saw the parties once, but never enjoyed the same pleasure again. All inquiries about them in the neighbourhood, and many were made, proved fruitless, except in so far as the peasants of the little hamlet close by, who carried victuals regularly to the chateau, declared the old servant there to have once called her young lady "Miss Blake." Upon this hint the Boulognites made a new trial, and various invitations, duly accredited by lady-signatures, were carried to the English stranger, "Miss Blake," by whom they were all declined verbally, through the mouth of the old servant. The discomfited messengers, after some vain attempts to extract a word from the servant, were fain to return whence they came. These circumstances caused the ladies of the chateau to be the subject of much talk, and the object of much curiosity, part of which was no doubt owing to the idle situation and habits of those who entertained the feeling. What could cause a young and beautiful girl thus to immure herself, could not be comprehended, and guessing but made curiosity keener. Such was the state of mystery in which the matter remained, when Otway came to Boulogne. His romantic and adventurous spirit was at once captivated by the story, and this led to the engagement already described.

Though not quite pleased with that engagement, as has been said, Otway had still curiosity enough to resolve upon prosecuting the adventure, though he also made a determination to desist at once, if he saw any danger of hurting the feelings of the parties chiefly concerned. His first step was to take his drawing portfolio, and visit the chateau. It was an ancient, solitary mansion, dark and gloomy in appearance, and rendered more so at this time, because the autumn had just passed, and the leaves were already beginning to fall from the trees around. Stephen Otway gazed long from a little distance upon the old house and its precincts, about which there was not the slightest sign of life or motion. He went away home that day, calling himself a "fool," and doubting even whether it would not be better to stand the laugh at once, and pay the bet. But the second day saw him again near the chateau, and on this occasion he felt as if rewarded for his trouble. The sounds of a harp, played by a skilful and delicate hand, struck upon his ear, and charmed it so much, that he remained on the spot long after the melody had ceased. It would be tedious to detail the progress of his adventure day by day. Suffice it to say, that he ventured in time to leave his secret stand, and take up a new position, within sight from the chateau. The harp was silent at his approach, but he busied himself so intently to appearance with his drawing, or in reading, that at length his presence did not impede the music. Nay, as day after day went on, his presence seemed to excite less and less alarm, and he saw a female figure flit sometimes backwards and forwards, across the light blinds of the windows. A little ruse enabled him to know whether or not he was the object, meanwhile, of any attention to the inmates of the chateau. He absented himself one day from his usual place, and took up another station behind a tree. To his inexpressible delight, a female figure came several times to the window, and peeped timidly towards the spot where he should have been.

Restless time was running on all the while, and a heavy fall of snow broke up Otway's visitations, telling him, besides, that many weeks of his time had now passed. But, in truth, he had almost forgotten the bet, having removed from Boulogne to a retired country lodging for some time back, and having his imagination entirely occupied with the fair unknown of the chateau, whom he of course clothed with all manner of virtues, mental and personal. As soon as the snow had partially melted, he flew to the old spot. Near to this place, he saw a number of peasants engaged in clearing the snow from a pathway, leading between the chateau and a wood at some little distance. What could be the purport of this? An idea struck him. It might be to permit the ladies to walk; but, then, if they did walk, they must either break their old rules, or walk by night. Otway now remembered having heard it said at Boulogne, among other hints, that the ladies did walk sometimes by night. He resolved to watch by the side of the path.

Night came, and Stephen still kept his place. But he was rewarded. From the point where he stood, he could see by the dim moonlight the front of the chateau, and two figures at length issued from the gate. They came towards the partially open spot near which Otway stood, and which he had chosen as the place where they would most probably make a halt. He had

not deceived himself. The ladies did stand still when they came thither, and one of them, after gazing for a time on the sky, uttered these words: "It is only since the snows have fallen, dear aunt, that this country reminds me of our own England—dear England! Would that I saw it again!" "And what should prevent you, Caroline, from going there to-morrow? Is this a life for one young, rich, and beautiful as you, formed to adorn the world, instead of pining in a solitude?" "You promised, dear aunt, not to speak thus again," replied the younger lady; "but my own foolish exclamation led you to it. Why should I wish for England again? Father, mother, brother, and sisters, all gone—all in the tomb! And my own dreadful irremediable mishap, but for which I might have tasted happiness like others, but for which I might have— But why think or speak of it! No one could love me; no, I must banish such ideas. Let me live alone with my griefs, and with the memory of those I have lost." "I meant not to vex you, dearest Caroline," said the aunt kindly; "but come—the snow is too chill for the feet. It has banished the young artist for some days from our park." "The snow chases away the birds," replied the niece, and Otway was sure she sighed as she spoke the words.

The two ladies turned, and walked away. But they had only gone a few yards, when the younger lady screamed loudly, and, as if instinctively, cried for "help." Stephen sprang from his hiding-place, and rushed to the spot. The aunt had gone a single step off the path while a cloud was on the moon, and had plunged through the snow and thin ice into a deep trench filled with water, by the way-side. Otway attempted to pull her out, but finding some difficulty, he at once stepped in himself, and raised her in his arms, and placed her on the path. As soon as he also was out, he took up the almost lifeless lady again, and saying to the niece, who hurriedly poured forth thanks, that "her friend must be immediately taken home," they set out hastily for the chateau. The old lady was instantly put to bed, and with the active exertions of the niece and the old servant, was restored to life and warmth. Otway, meanwhile, was left in a handsomely furnished apartment, where, after her aunt's recovery, Miss Blake, for such was indeed the lady's name, rejoined him. "Oh, Sir," cried she, while gratitude beamed on her lovely countenance, now for the first time rightly seen by Otway, "you have been our good angel. I owe to you a life as dear to me as my own. But, good heavens!" she continued, as she saw Stephen trembling in spite of himself with cold and wet, "I have been so ungrateful as to forget your condition." Otway would have said something, but the young lady did not wait to hear it, and in a few minutes the old servant came to conduct him to a bedroom, which her mistress insisted upon his immediately retiring to. Our hero, who felt himself really almost unable to stand, obeyed the order, and followed the servant.

A night's rest and good fire did not remove the effects of the adventure from Otway. He felt himself totally unable to rise. But what of that! The "sweetest voice in all the world," as he thought it, came to the door of his chamber, and made inquiries for him, mingled with many regrets that he could not be better accommodated. For two whole days Otway kept his room, and on the third evening he was enabled to rise, and was led by the attentive old servant to a parlour, where he was warmly welcomed by Miss Blake and her aunt. Here Stephen stammeringly and blushing attempted to say something about his love of "moonlight scenery," and also of "drawing," for the ladies had recognised him as the artist who daily visited the chateau. He moreover explained to them the circumstance of his having been on a tour, and having staid for a time at Boulogne on his way to England. Some how or other, Miss Blake blushed also during this explanation. But more easy conversation followed, and Miss Blake played and sang, to her visitor's great delight. He soon found, also, that she possessed a highly cultivated mind, in addition to grace of person and beauty of countenance.

For some days this intercourse continued, Otway's continued weakness forming the plea for his remaining at the chateau. Every time that he saw the young lady to whom he had been thus strangely introduced, he admired her more and more, and his wonder grew stronger as to the "misfortune" or mystery that hung around her—for there was mystery at the chateau. Otway never saw the ladies during the day. They took their meals alone, and it was only in the evening that they met him in the little parlour. Even there, something odd was to be observed; for only a single lamp was kept burning in it, rendering the apartment dusky and dim. The aunt, during her niece's absence, gave an explanation of these things by stating, that since the death of her parents Caroline had been unable to bear the light, through some nervous affection, or peculiarity of constitution. Stephen Otway was but half satisfied with this; yet when he looked on Miss Blake, he could not believe that aught of impropriety could attach to one like her. So modest seemed she, that when she met his eye, her own was ever cast on the ground. Still Otway could not help flattering himself with the hope that she liked him, as he felt that he loved her. Such were his feelings and meditations after he had spent a week at the chateau, and the time had come when he ought to take his leave. One evening at this period, when the aunt was for a short time absent, he ventured to express his surprise that one so fitted to adorn society should fly it. Miss Blake became evidently somewhat agitated, but only replied that the death of her parents had affected her much. Otway thought

such a heart must be a treasure, when enclosed in such a form, and in a few moments he had told her that he loved her, and entreated her to permit him to visit the chateau in future, and to hope that she would be his. Miss Blake showed great agitation. Averting her head, and trembling from head to foot, she faltered forth in broken accents, "Leave me, Mr Otway—leave me, for your peace and my own! I am an unhappy creature—a miserable, unhappy creature! Fly from me!"

The aunt's footsteps were heard at this moment, and soon after her entrance, Caroline retired. She did not appear again that evening, and on the morrow Otway left the chateau, as he had previously announced his intention of doing. He did not go, however, until he had sent a note requesting leave to inquire for the ladies at a future time, which permission he received in reply from the aunt. Stephen left the chateau with his thoughts brooding over one point—the mystery that seemed to surround Miss Blake. For several days did he ruminate on this in his solitary lodging, until the time came when he had to appear at Boulogne, to settle the matter of the bet. But though he had gained his point on becoming acquainted with these ladies, one of them had become far too dear to him, to permit him to make them the subject of further foolery, and he had long resolved to pay the bet, and mislead his Boulogne friends as to the issue. He was pretty sure that none of them would know what had passed at the chateau. So it indeed proved. Stephen gave the appointed dinner; and as some other nine-days' wonder had taken up the attention of the loungers, the ladies of the chateau, to Stephen's great satisfaction, were forgot after the first bumper to the entertainer, in honour of the occasion.

Before Otway left Boulogne again for the country, letters were brought to him from England. One of these was from an especial intimate, who, after giving him news of British matters, went on thus:—"I only learnt two days since of your having come to Boulogne, from our friend Woodley. He tells me of a bet—you didn't use to bet, Otway—which you have taken up, about two ladies who live in a retired manner near Boulogne. I think too well of you, my dear Stephen, to believe you capable of annoying or insulting any lady or ladies, but if I am right in my supposition respecting these persons, I think you would feel especial regret at giving them a moment's pain. Caroline Blake, I think, is one of these ladies, and she is one of the best girls that ever breathed, as well as one of the most lovely and most sensitive. Her sensitiveness, indeed, approaches almost to disease. Her parents, and in truth her whole family, died some time back, through a pestilential fever, and this girl almost killed herself by watching over their successive death-beds. She was left the sole inheritor of an ancient name and a handsome fortune, but, unhappily, in her attendance on the last of her family who died, she also caught the seeds of the infection. She recovered her health, however, and all her loveliness, but alas—" Otway read a few words farther, and the letter dropped from his grasp. He fell back in his chair, and struck his brow with his hand. "Dreadful!" he exclaimed to himself, "dreadful—irreparable loss! Poor Caroline! This then is thy unfortunate secret! And am I so poor a thing as shudder at and forsake thee for what thy very virtues have occasioned! Yet it is a horrid thing!" He shall give no more of the young gentleman's exclamations, but content ourselves with saying that they continued long, so long, that an old crusty fellow, who slept that night below Otway's room in the inn at Boulogne, declared that he could get no rest till morning, for a stamping madman above.

The issue is what we have to do with. On the evening after receiving this letter, Stephen Otway presented himself at the gate of the chateau. He was admitted, and was received by Miss Blake with a blush, which soon passed away, and left her countenance calm and pale. The minds of both the young people seemed to be internally occupied on this evening, and the aunt had the discourse chiefly to herself; but she left the room for a moment, and Otway seized the occasion to resume the subject of his love. "The night is beautiful," replied Miss Blake; "will you walk with me a short way! I was prepared for your recurrence to this subject, and would speak with you. But not here—let me have the free air." She spoke this with a sort of assumed calmness. "Noble girl," thought Otway, "she could, but will not deceive me." The pair were soon ready for the walk. Stephen would have spoken as soon as they left the gate, but Caroline checked him. "Not yet—not yet," she said; "it may be the last time I shall see you! Do not shorten our meeting!" She leant on his arm at the same time, as if she were afraid of their separation being accelerated. They reached the spot, however, where the aunt's misfortune had happened, and Miss Blake stopped short. She struggled in vain for a few moments to speak, but at last compelled herself, by a strong exertion, into calmness. "Otway!" said she, "you say you love me; but you will soon fly from me. I am an unhappy creature, and cannot blame you. See here, Otway! mark this irreparable blemish." As she spoke, she lifted his hand to her face, and placed his finger on one of her eyes. "It is cold, lifeless glass! Now, I know you cannot but feel dismay and horror at me," continued she, averting her head; "fly from me, fly, and seek a more happy mate." "Caroline!" replied Otway, "I knew it, and I knew its cause! I love you still—more fondly than ever, since I have seen this new test of your nobleness of mind!"

These unexpected words so overcame the young lady

that she would have fallen to the earth, had not her lover's arm sustained her. His endearing words soon recalled her to consciousness. And now our story is ended, but we cannot help saying that Otway had never reason to repent of the marriage which followed soon after the events related. We have met his lady often in society, and should never have remarked the blemish in her visage, had she not pointed it out herself on one occasion. Glass eyes are not hereditary. Her children have the most beautiful peepers in the world.

THE COCKERILLS.

THE name of "John Cockerill," as was lately remarked in the present work, comes frequently into notice in connection with the locomotive machines on the Belgian railways, and is otherwise frequently heard of in all parts of the Netherlands, as well as in France and Prussia. This eminent individual, who may be styled the Bonaparte of continental mechanism, is an Englishman by birth and parentage. He was not precisely the founder of his own fortune, though it is owing to his own singular genius that he has attained the rank he now holds. The first important man of his family, was his father, William Cockerill, of whose biography—although once sketched before in the Journal—a few particulars may be here stated.

William Cockerill was, at the outset of his career, a working blacksmith in England, but not one of that order, necessarily the most numerous, to whom limited gifts and limited wishes assign the not unhonoured lot of passing the whole of life in daily toil. Endowed with an understanding which could calculate great results from certain combinations of moving powers, he was constantly bent upon important mechanical designs, which he longed to have the means and opportunity of putting into execution. He was a fine specimen of those intelligent artisans who have been the improvers of machinery in England, and ultimately its principal employing manufacturers—the class to which it may perhaps be said that we owe all the distinction we possess as a manufacturing nation. As often happens, nevertheless, William Cockerill met with little encouragement in the scene of his early labours, and towards the close of the last century, when he had attained middle life, and surrounded himself with a family, he migrated to the continent. The immediate reason for this step has been variously stated, and it is not of material consequence. Along with some other skilful mechanics, he proceeded, by the permission of our government, to St Petersburg, with the view of following out certain plans of the Empress Catherine, for establishing manufactures in her dominions. The death of the empress, and the accession of the madman Paul, ruined his prospects in Russia, and after a time he was fain to make his escape to Sweden. Here, under the protection of the British envoy, William Cockerill was employed as engineer on some public works, which no native Swedes could undertake. Engineering, however, did not suit his genius, and hearing of the manufactures of Liege and Verviers in Belgium, which were flourishing in spite of defective mechanism, he imagined that, if he were in either of these places, he should be certain to succeed as a constructor of machines. Luckily, from his economical habits, he possessed the means of removing from Sweden. He proceeded, first, as we are told, to Hamburg, where he disclosed the plan of his proposed operations to Mr Crawford, the English consul—at the same time stating, "that if he could obtain a small pension from the British government, he would return to England, not wishing to do any injury to his country, by introducing machinery into a foreign one." From what appears as to this overture, we cannot deem it creditable to Cockerill; but it is probable that we do not know enough of the facts to be entitled to speak decisively on the subject. Mr Crawford, it appears, approved of the proposal, and communicated it to the ministry; but no answer being returned at the end of six months, Cockerill proceeded to the Netherlands, there to seek fortune with his own head and hands.

The settlement of this mechanical genius in the province of Liege, was perhaps the most important event in the social history of Belgium. Not only did the country possess abundant supplies of coal, iron, and other elements of manufactures, but the people were generally animated by a keen anxiety to bring all these resources into active service. Of the Liegeois, in particular, who have been for centuries a busy people, it might be said that they required nothing, in order to compete with the English, but a knowledge of the fabrication of those mighty mechanical agents which had been planted in Lancashire and other parts of England. In such circumstances, the arrival of William Cockerill was exactly the most auspicious event that could have happened. He made offers to some extensive woollen manufacturers of Verviers, a town within the province of Liege, to construct for them new machines of his own invention for the carding and spinning of wool, and for other purposes connected with the production of cloth fabrics. The offers were accepted, and William Cockerill forthwith brought his family from England, and settled with them in Belgium. At this time his stock of cash was very slender, and those who ordered machines from him, had to supply him with the necessary metal; but Cockerill's sons

were growing up, and, with the assistance of their hands and his own, he speedily executed all orders, and founded a thriving establishment. The workshop of the Cockerills at Liege became a famous one, and the quantity of machines made for various manufactures was soon very considerable.

In the year 1813, the elder Cockerill retired from business, with a handsome fortune, leaving his two sons, James and John Cockerill, to follow out his trade. They did so for several succeeding years, and at length James also retired with a competency. John, who was now left alone, and who is said to possess the most enlarged mind of them all, erected, in 1815, the first manufactory for steam-engines which had been seen, on a large scale at least, in Belgium. His machines were soon distributed over the whole continent; but this was done far more extensively afterwards, when he erected new iron-works of vast size at the village of Seraing on the Maese, distant a few miles from the city of Liege. The magnitude of this establishment may be conceived from the fact that it keeps in continual motion sixteen steam-engines, of the collective force of nine hundred horse-power, and employs three thousand workmen. This establishment was organised by John Cockerill between the years 1821 and 1823. Yet, immense as are the operations here conducted, numberless as are the railway projects here perfected, and the steam-engines and machines of all sizes and descriptions here constructed, the establishment of Seraing is but one of the many great concerns which John Cockerill superintends, and of which he is wholly or in part proprietor. He still keeps in action the extensive foundry, originally possessed by his father in Liege; holds large shares in mining and colliery establishments; and possesses large cotton-spinning factories, as well as linen-manufactories, where these stuffs are put into all forms, weaving and printing included. He is also the proprietor of a paper manufactory. All these establishments he in a measure superintends in person, but, at the same time, it is especially remarked of him that he takes care to have the best of servants and overseers, sparing no expense in bringing such persons from all countries of Europe to his various works.

Such are the concerns of John Cockerill, and such are the sources of capital and material which lately enabled him to come forward, unassisted and unrivalled, to offer himself as the contracting party with the French government for the laying down of a railroad between Paris and Brussels; perhaps the most stupendous enterprise of the kind ever undertaken by an individual. This remarkable man, if we may trust to the accounts given of him, is not stimulated in his career of enterprise merely by a desire of personal emolument or aggrandisement, but seemingly regards himself, and acts, as one who has a great mission to execute, that, namely, of peopling the world with machines for the spreading of wealth and comfort among its inhabitants. He is said to use his wealth most generously on private occasions. To a young man whose father had once done a service to the elder Cockerill, the present inheritor of that name made on one occasion an advance of machinery to the value of 15,000 francs, in order to establish the youth in the line of business to which he had devoted himself. For this liberal aid he refused all security or guarantee, willing to risk any thing for the gratification simply of his filial gratitude.

To English readers who may not have seen, or even heard described, any of the large iron-works in their own country, the following account, given by a lively French writer of his visit to Mr Cockerill's establishment at Seraing, cannot fail to be acceptable:—

"I had the honour (he proceeded:) to be conducted over the works by one of the principal managers, M. Mauninger, a young German of great merit, grave and laconic in speech, like his principal, but expressing himself with perfect clearness. He was kind enough not to suppose that I knew any thing of practical science, although he knew I was from Paris, where, in my capacity of journalist, I had sometimes been able to guide governments and assemblies. He led me back to the elements of things, and explained to me even matters that were clear, by which proceeding, in my opinion, he showed me a more real mark of esteem than if he had left me in my ignorance, that he might not appear to doubt my knowledge.

In the magnificent establishment at Seraing, one's attention, naturally, is most attracted and captivated by the workshops where the machines are finished. There are three principal ones, each of immense extent; the first for boilers or cauldrons, the second for locomotive-engines, and the third for steam-engines, properly so called.

In the boiler workshop, it is necessary to renounce the pleasure and utility of explanations on the spot. The sharp and piercing noise rends the ear; the hammer strikes incessantly on these vast hollow vessels of wrought iron, till their sides groan and resound like those of the Trojan horse. They are of all forms, not made so at the command of taste or fancy, but to suit the place and purpose for which they may be destined. If circumstances may require that it should be placed in a spot full of angles and recesses, the vessel is so shaped as to fit into these as if cast in a mould. Clay is not more pliable in the hands of the potter than these thick sheets of iron under the intelligent hammer of the workman of Seraing.

I saw the way in which they pierce thick iron-plates, and join two or more of them by means of large-headed rivet-nails, which run in a string along the joints of the

boiler, as thick as the gilded knobs on an antique easy-chair. The piercing is effected by a punchon, fixed in some measure as in a printing-press. Two workmen are employed in the task; whilst one loosens the screw to which is fixed the sort of wimble that bores the hole, the other arranges the iron-plate below the screw at the exact spot where it is to be cut; then both of them take hold of a strap passed around a wheel that gives motion to the screw, and, with a forcible pull, insert the wimble, which immediately cuts out a small circle, like a coin, from the plate. When all the requisite holes are thus formed, and two plates are to be joined together, the nails, or pieces of metal to form the rivets, are heated red-hot in the forge, and placed in this condition in the holes, when two workmen commence to strike on both sides, and continue until the heads of the rivets are flattened and levelled.* No known force could start them from their places, when the operation is thus closed.

But that which astonished me most about Seraing, was the workshop for steam-engines, with its vast dependent compartments, where all the separate pieces are made, which enter into the construction of these machines. One's head turns round in the midst of so many thousand wheels, great, little, and least, which go at all rates and degrees of speed, and which move and intermove by means the most divers. Machines are there as multitudinous and varied as the ends they serve; there is one for every object, or, rather, it is the same object which has a thousand ministers; one saws, another splits, a third cuts, and a fourth planes; there is one to rough-hew the work, another to give it the exact shape, another to smooth, and another to polish it. The chisel, the lathe, the plane, the punchon, the pincers, the hammer, all the instruments of the joiner, the turner, and the smith, operate upon the iron as upon the softest wood, and this without the agency of joiner, turner, or smith; the hand which moves them is a machine; that hand, always sure, always firm, delicate, and nimble, without inequality in its action, and dependent on no passing caprice, never growing dull, weary, or old! Some of these machines fly faster than the eye can follow; others seem not to stir at all, yet move with a pace regular though unappreciable. Come to-morrow, and, sluggish as it seems, it will have finished its task, or be commencing a new one. Certain machines are placed simply on the floor, like moveables that may be transposed at will; others are lodged in hollows more or less deep, or are sunk only half-way down, in order that they may have the exact height necessary to bring them within the compass of the hand. Large alleys between the different ranges of machines, and sufficient separating spaces between each, permit the workman to move about freely, and give him scope to relax his limbs without danger of being entangled by the wheels.

From the top of each main piece of apparatus, through the whole of the work-rooms, straps of leather fly in incessant motion, conducting the power to the parent machine, whence it is distributed to the others. One might say that the whole of these irresistible forces was distributed by ribbons.

It was here that I saw the boldest and most notable application that has ever been made, of a machine whose results are extremely nice and important. The use of this machine is to give such a polish to the inside of cylinders, that, while the piston fits and fills the cavity almost hermetically, it may also glide up and down with the least possible friction, so as doubly to economise the moving power, first, by allowing none of the steam to escape, and, secondly, by opposing the minimum of resistance. The machine mentioned receives the cylinder in a rough state, newly taken from the mould, and presenting those asperities, and that sort of grain, which make cast-iron appear like granite. Nothing can be more simple than the action of the machine: by a combination of wheels, there is pushed forward into the interior of the cylinder a revolving instrument, composed of four or five chisels, of the finest tempered steel, projecting from a strong centre, like the spokes of a wheel; every revolution of this instrument takes a circular chip from the cylinder, and by pushing it forward regularly, the whole interior is made as equal, smooth, and polished, as the blade of a sword. The cylinder which was polished thus at the time of our visit was of immense size, being for an engine of five hundred horse-power. The enormous receptacle destined for a piston twenty feet high, lay immovable upon a piece of mason-work, whilst the wheel, armed with its chisels, coursed its way internally, slicing the cylinder's sides, without noise, without visible motion, alone, without spectator or guide; for this machine has no need of superintendence; give it its task one day, and provided no portion of the moving power be withdrawn, it will end that task by the fixed time; it will deliver the work to you, like a living workman; and should you arrive beyond the period necessary for the completion of its labour, you will find it revolving in air, waiting for a new occupation.

Other machines have more or less need of surveil-

* This, as is well known, is a very noisy process: it may already, however, be considered among the things which are past, or are soon to be so. The ingenious Mr Fairbairn, of Manchester, has recently invented a piece of mechanism, which fixes the nails in perfect silence, with great expedition, infinitely greater certainty of making all tight, and at very much less expense, in consequence of the saving of human labour. It is not unworthy of remark, that this admirable invention for the saving of labour is one of those which might be enumerated as brought about in consequence of difficulties experienced in dealing with workmen.—*Ed. C. J.*

lance and aid. By the side of each stands a workman ready to advance or withdraw the article in course of manufacture, as occasion may require, and to remove from or replace upon the principal wheel the conducting strap, which continues to turn in air by the side of the wheel when not called into action; a disposable force, which a finger applies or takes away. Many of these workmen have their pipes in their mouths, and stand, with folded arms, eyeing with constant attention the progress of the machines, those dear companions of their toil, which relieve them from the weight of the menial labour, and leave to them, as it should be, the parts requiring reflection and intelligence. The men are very diligent, and look on with a keen watchful eye. Most of the work done here requires great delicacy and niceness of finish, and without extreme attention the machine would soon devour the piece which it received only to polish. Man's share in the labour is therefore at once more easy and more worthy of him; to the machine belong the great physical efforts, the indefatigable force, and the toil which would exhaust man; to man are left the conception, the responsibility of foresight, and the surmounting of difficulties. In quitting his work, the workman has those powers spared to him which he can employ usefully at home, in improving his dwelling, and in making repairs which would demand the hand of another, and would cost a part of his wages if he returned from work wearied and exhausted. What is it, besides, that raises in operatives the accursed desire of stimulating liquor, but the crushing weight of physical toil? He who comes from work lively and active, escapes more easily the temptations of the tavern; he loves his house better, from entering it less fatigued; he is the better husband, the better father; he has none of those evil dispositions which an operative brings to his home after exhausting, and more than exhausting, every muscular energy for a master, and which lead him, with something of a pardonable selfishness, to begrudge his family the ample share which they must necessarily have of the means which he has so painfully earned.

Besides that general improvement in the condition of the workman who is employed in connection with machines—an improvement not peculiar to the establishment of John Cockerill—there are other internal meliorations that are peculiar to these works, and solely due to his sagacity and genius, at once inventive, bold, and benevolent. I do not allude to the roominess of the workshops, to their cleanliness, and to the purity of the air, but to other benefits conferred on the operatives, and which were not called for, like these things, or the score of obvious necessity. I allude to such exertions as the robing or clothing-rooms, where the workmen hang up their out-of-door clothes when they come, and their working ones when they go away. Every workman has his place marked by a certain number, and a placard with his name. This is transplanting the habits of the business-office into the workshop. But what struck me most of all, was a large hall in the centre of the works, with a stove in the middle of it, neatly ornamented like most of the Belgian stoves; and upon this stove, morn, noon, and eve, there hangs a kettle filled with warm coffee. It is in this hall that all the workmen meet at certain hours of the day, in the intervals of labour, and take their coffee, men and foremen together, the latter holding a certain moral presidency, which the others willingly acknowledge. They here chat without noise or quarrelling, until the sound of the clock calls every man to his duties again."

FORMATION OF THE VOLCANO OF JORULLO.

ABOUT eighty years ago, the plains of Jorullo, in Mexico, were the scene of one of the most extraordinary and tremendous catastrophes that ever wrought a change upon the face of the globe. The southern portion of North America, from about the twenty-fourth degree of north latitude, across the isthmus of Panama, to the second degree of south latitude, is a tract of country which deserves to be entitled, *par excellence*, the region of volcanos. One great chain of volcanic mountains, with but little interruption, extends over these twenty-six degrees of latitude; but if we include the bendings and curves which the chain or cordillera makes, we cannot estimate the space over which it passes at much less than two thousand miles in length. Many of the craters, which open like enormous cups on the summits of these mountains, remain in a state of constant activity, emitting vapour, and sometimes flames and ashes; others are subject to periodical convulsions; and a third class appear to be altogether exhausted, as no eruption of them has been known to take place. Several of the lofty peaks penetrate far into the region of perpetual congelation; and from their inaccessible summits, mantled with the snows of unnumbered ages, smoke is seen continually to issue—a striking spectacle, rendered still more remarkable by the volcanos occasionally giving forth luminous exhalations. Not a few terrific and disastrous eruptions are on record, but none in its astounding effects is to be compared with that by which Jorullo was formed, and of which the celebrated Humboldt was the first to present an account to Europeans.

Until the year 1759, the present site of the volcano was a fertile plain, well cultivated, and producing abund-

dance of indigo and sugar. It appears to have been a place to which the inhabitants were particularly partial, for the fields were abundantly watered by artificial means, and a plantation was here formed, reckoned one of the largest and richest in the country. In the month of June of the above year, subterranean noises of the most appalling description were heard, accompanied by frequent earthquakes, which, for nearly sixty days, continued to terrify the inhabitants. A short period of tranquillity then intervened, and every thing appeared to be subsiding into its wonted tranquillity, when, on the night of the 28th September, the horrible subterranean peals were renewed, and a tract of ground four miles square swelled up like an enormous bladder to the height of five hundred feet. The affrighted Indians fled to a neighbouring mountain called Aguasarco, and those who witnessed the catastrophe informed Humboldt that flames were seen to issue forth for an extent of more than half a square league, that huge fragments of burning rocks were propelled upwards to an enormous height—whilst through the dense envelope of smoke and ashes, illumined by the lurid blaze of the volcano, the softened surface of the earth was seen to rise and fall like a tempestuous sea. Several rivers had their currents "turned awry," and were precipitated into the fiery gulf, thereby invigorating the flames, probably from the water being decomposed by the intense heat. Thousands of small cones, varying from six to nine feet in height, issued forth from the softened and inflated surface of the ground. In the midst of these ovens, as the natives expressively called them, six large masses sprang up from the bosom of the burning chasm, into an elevation of from thirteen to seventeen hundred feet each. The highest of these hills is the great volcano of Jorullo, which burns continually, and has thrown up upon one side an immense quantity of ashes and scorificious lava. These great eruptions of the central volcano continued without intermission till the month of February 1760, but in the following years they became gradually less frequent. Great numbers of these small cones or ovens still continue to pour forth steam, and emit a subterranean noise, which appears to announce the proximity of a fluid in ebullition. According to the testimony of the Indians who were present at the catastrophe, the heat of these volcanic ovens has suffered a gradual diminution, but Humboldt still found their temperature near that of boiling water. The surrounding atmosphere, too, was heated to such a degree, that, at a great distance from the surface, and in the shade, the thermometer rose as high as 109 degrees of Fahrenheit. "This fact," our traveller remarks, "appears to prove that there is no exaggeration in the accounts of several old Indians, who affirm, that for many years after the eruption, the plains of Jorullo, even at a great distance from the scene of the explosion, were uninhabitable from the excessive heat which prevailed in them." The ashes of this eruption were scattered to the distance of 160 miles. "The traveller is still shown, near the Cerro de Santa Ines, the rivers of Custamba and San Pedro, of which the limpid waters formerly irrigated the sugar plantation of Don André Pimentel. These streams disappeared in the night of the 29th of September 1759; but at a distance of 6560 feet farther west, in the tract which was the theatre of the convulsion, two rivers are now seen bursting through the argillaceous vault of the hornitos (ovens), of the appearance of mineral waters, in which the thermometer rises to 126 degrees Fahrenheit." The Indians continue to call these streams San Pedro, and Custamba, because in several parts of the volcanic ground great masses of water are heard to run in a direction from east to west. We have here, then, a double phenomenon, the formation of the volcano itself, and that of a subterranean river; such, however, have been found in other regions of the globe.

On this catastrophe Humboldt justly remarks, that an event "by which so considerable a tract of country entirely changed its appearance, is perhaps one of the most remarkable physical revolutions in the annals of our globe. Geology indicates parts of the ocean where, within the last two thousand years, several small volcanic islands have been formed; but it gives no other example of the formation from the centre of a thousand burning cones, of a mountain of scorificious and ashes 1695 feet above the level of the adjoining plain, upwards of thirty-six leagues from the sea, and forty-two leagues from every other active volcano." It is remarkable that this new volcano was formed in a direction parallel with the line, running east and west, in which all the elevated summits of the old volcanos are found. And in connection with this curious fact, it is mentioned, that from the lake of Cuicaco in the same quarter of Mexico, which is impregnated with muriate of soda (common salt), and exhales sulphuretted hydrogen, to the city of Valladolid, an extent of forty square leagues, there are a great number of hot wells. From these indications of volcanic action in this particular region, Humboldt infers, that there probably exists here, at a great depth in the heart of the earth, a chasm, in a direction from east to west, and for a length of 137 leagues, along which

the volcanic fire, bursting through the interior crust of the porphyritic rocks, has at different epochs made its appearance. The theory is plausible enough, but as yet the subject of volcanos is involved in much obscurity.

POKINGS IN ETYMOLOGY.

SECOND ARTICLE.

To the examples we have already given of words whose origin appears so obscure that any attempt to trace it will be viewed with scepticism, may be added that of *dust*. The results of Macadamization, as developed in a windy day after a continuance of scorching weather, naturally lead us to consider the origin of the dense cloud produced, and hence to discover the source of its appellation. The Latin verb *aduro* indicates the intense action of the heat in comminuting the particles of the surface so as to render them easily and copiously borne on the wings of the wind. Each particle or mass of particles is manifestly *adustum*, or "scorched," from which participle of *aduro* the word *dust* may be supposed to have proceeded. From the primitive of this verb, namely, *uro*, "to burn," is also plainly derived the *urn* that contained the ashes of the dead.

The verb *atone* has an elegant and truly English parentage, implying that the offending and offended parties are now at one, or reconciled.

The endearing epithet *darling* is of that interesting class of diminutives terminating in *ling*, such as *nursling*, *fountling*, &c., being in fact merely a corruption of *dearling*, or "little dear."

The expressive word *atom*, though appropriated to the ultimate particles or elements into which matter is supposed resolvable, is not itself an elementary word, but beautifully portrays the theory involved in that supposition, namely, that there is an extreme limit beyond which there is no possibility of further division, from the Greek *a*, the privative particle, and *τομή* (*tomē*), "section."

The verb to *curtail*, of French extraction, is remarkably expressive, being an inverted contraction of *tailleur court*, "to cut short."

In the word *journal*, the legitimate offspring of the Latin *dies*, "a day," we have another striking instance of all family resemblance disappearing, since these words have not one letter in common. From *dies* proceeds *diurnus*, "daily," from which, by softening the sound of *di* before *u*, come the French words *jour*, "day," and *journal*. An example of this softening we have in the vulgar pronunciation of *duty* as *joody*. From the same source proceed *journey* (or *journee* in French), which formerly implied the amount of travelling, or indeed of any other labour performed in the course of one day; whence also *journeyman*. Talking of *travel*, and of labour (in old English *travail*), it is obvious they spring from the same French parent *travailler*, thus conjuring up a striking contrast between the pain of ancient, and the pleasure of modern, locomotion.

Who would ever imagine any affinity of descent between the words *torch*, and *torment*, *torture*? Yet it is undeniable that they flow from the Latin *torqueo*, *torri*, *torium*, to *twist*—the former word indicating the convoluted form of the ancient flambeau, and the two latter having a graphic reference to the mental or bodily writhings of their victim.

Few words can boast of a more graphic composition than *effrontery*, from *ex*, "out of," and *frons*, "the forehead." To raise the forehead, and present it fair and open to observation, is the natural language of the feeling of confidence. Any one who, when accused, or under suspicion, can do this, and stand unabashed and unblushing, must either be really innocent, or gifted with a vast amount of hypocrisy, self-command, and assurance. Perhaps, amongst our forefathers, the act might be rendered more expressive if the hair, usually worn over the forehead, were set aside or parted, so as to bring that rarely seen feature into sudden and conspicuous view. It would then be natural to regard the forehead as speaking for the accused—as if an actual pleading proceeded *ex fronte*, out of the brow. Such might be the process of ideas which gave rise to the word *effrontery*.

Often can an elegant illustration of the national character be elicited from the modification of structure which a foreign word experiences on its adoption into the language. It may be thought extravagant to view the expansion of the Latin *cor*, "the heart," into the Spanish *corazon*, as referable to the greatness of heart, and, on the other hand, the contraction of *comedere*, "to eat," into *comer*, as referable to the moderation in eating of the Spaniards; but, even allowing this instance to be overstrained, the principle itself is unquestionable.

The familiar word *ditto*, by which much repetition is saved to many a worthy book-keeper, remains an imperishable testimony to the glory of modern Italy in having taken the lead in the revival of commerce amidst the surrounding barbarism of feudal ascendancy. It is nothing more or less than the Italian for "said," but has now acquired a technical appropriation to mercantile language, which is indebted to the same origin for many other words of equal convenience.

That caricature of humanity, ycleped a *monkey*, can

boast of a dignified ancestry to its name, which is manifestly an abbreviation of *monnikin*, or *mannikin*, "a little man." It is to be hoped that no rational *homunculus*, or miniature of manhood, will grudge it this aspiring cognomen.

The verb to *revolt*, compounded of *re*, "again," and *volvo*, "to turn," is beautifully illustrated by that passage of Scripture which recommends pearls not to be thrown before swine, "lest they turn again and rend you."

Though the origin of *husband* must be known to many, yet to some of our readers it may perhaps be both interesting and instructive to know that the domestic chief is thus dubbed from his being, or at least from his obligation to be, the *band* that unites the *house* together—the bond of union among the family. How desirable that all *husbands* were *house-bands* in reality as well as in name!

The peculiar characteristic of that prince of the finny tribe, the *salmon*, is well indicated by the etymology of its name, which undoubtedly proceeds from the Latin verb *salio*, "to leap," and stupendous are the leaps which this fish occasionally performs.

The word *person* has a singular origin, having, in its Latin form *persona*, implied at first merely the mask invariably worn by the actors of antiquity, through (*per*) which their voices sounded (*sonare*). In process of time the word extended its meaning from a thing to speak through, or mask, to the performer that wore it, and, by an easy transition, since "all the world's a stage," came finally to be applied to "all the men and women" who "are but actors" thereon.

One is tempted to trace the origin of *insult*, coming, as it obviously does, from the Latin verb *insilio*, "to jump upon," to the first recorded case of insult in Roman history, where Remus, to show his contempt for the limited boundaries of infant Rome, leaped over them, thus giving mortal offence to his brother Romulus. At this day, when an Irishman has exhausted all his expedients in the way of picking a quarrel, he spreads his upper garment on the street in the hope of some *insult*, and therefore *insulting*, movement thereon by some other amateur of the shillelah.

The word *surgeon* has deviated remarkably from its parent orthography, namely, the Greek *χειρουργος* (*chei-rourgos*), from *cheir*, "the hand," and *ergon*, "work." It came to us from the French form *chirurgien*, which word, from the peculiar tendency to abbreviation so remarkable in our language, has at last subsided into *surgeon*, leaving the single letter *s* as the representative of *cheir*.

Assiduous has an extraction strikingly descriptive of its meaning, being from *ad*, "to," and *sedeo*, "to sit," and consequently implying the fixity of purpose which urges an individual to sit to his undertaking.

The verb to *prevent* is a striking illustration of the widely divergent and even apparently contrary meanings which the same word may exhibit, when not viewed in reference to its etymology. To *prevent* is the Latin *prevēnio*, and implies literally the action of "coming before." Keeping this origin in view, we shall easily explain the seeming contradiction which is involved in the following and similar expressions which are now obsolete in the language. Thus, in one of the beautiful prayers of the English church, we implore the Lord "to *prevent* us in our humble supplications." And in the 119th Psalm, at verses 147 and 148, we read, "I *prevented* the dawning of the morning, and cried: I hoped in thy word. Mine eyes *prevent* the night-watches, that I might meditate in thy word."

The word *ink* presents, in its formation, not only a historical memento of the original inventors and almost sole users of that fluid, but also another vivid example of the abbreviating power of our language. Its Italian cognomen *inchiostro* (pronounced *inkyostro*), means literally *in a cloister*, and recalls to memory the deep obligations which literature owes to those ecclesiastical retreats in which its vestal fire was so long piously guarded.

The words *edify* and *edifice*, except to the Latin scholar, betray no marks, beyond the mere orthography, of a common origin. The primitives from which they both issue, are *ades* and *facio*, denoting the *making of a house*. The comparison of mental or moral improvement to that process, which commences by laying a secure foundation, and then rearing an upright and durable structure, is, though trite and obvious, of surpassing beauty. There must, nevertheless, be many who use the words daily without knowing their literal meaning, and who would be *edified* to a certain extent if informed that these terms imply a building up or fortification of their minds against evil and for good. A quaint combination of the literal and allegorical meanings may be seen on the doorway of a parsonage near Edinburgh, "Edificamus ut edificemur," "We [the heritors or land-owners of the parish, of course] *edify* (build the manse) that we may be *edified*."

The seemingly coarse and homely name of *kickshaw*, which is recognised by Johnson, and defined by him "a fantastical dish of meat," expresses, in its French original, a mere "*something*." Its plural form *kickshaws*, which is the more legitimate form, is but an Anglicanisation of *quelques choses* (some things), which, from the allowable silence of the *l* in this word, sounds, in English orthography, *kick shoes*. Johnson's definition of the word agrees admirably with its import in that Scottish song in honour of kail brose, where, speaking of our ancient banquets, it is recorded that

"Nae *kickshaws*, nor puddins, nor tairts were seen there,
But a cog o' gude brose was the favourite fare."

Speaking of *brose*, it may not be generally known that this "favourite fare" of our ancestors derives its name from a more learned source than might be expected. It is really the Greek word *βρωσις* (*bro-sis*), "food" (the rejected syllable is being merely the postfix of gender), which again is from the verb *βρωω* (*broo*), "to eat." We may remark, by the way, that this verb is still to be recognised in the English one "to *browse*."

DRINKING USAGES OF ENGLAND.

A NEW and greatly extended edition of Mr Dunlop's work on the Drinking Usages of Great Britain and Ireland,* has just reached us; and the subject being one of great importance as respects the moral and intellectual advancement of the people, we propose bringing it under the notice of our readers.

Mr Dunlop is well known as the president of the Temperance Union of Scotland, and has rendered himself conspicuous by his zealous yet discreet advocacy of a general abstinence from intoxicating liquors. Enthusiastic in the cause he has espoused, he has taken the trouble to collect into the volume now before us, a large array of facts respecting the drinking usages prevalent in all classes of society, and among every order of tradesmen; his object, as it may be presumed, being to shame men out of their intemperate and frequently very silly customs. A few years ago, when the idea of abstinence from all kinds of intoxicating fluids was first announced, it was necessary to explain, by way of preliminary to assaults upon drinking usages, that there were really no nourishing properties in alcoholic beverages—or at least that any slight benefit they conferred, was united to so much that was positively vicious, that they might with great propriety be altogether set aside and rejected. This important truth is now so generally recognised, that few have the temerity to dispute it. The question of abstinence from intoxicating drinks, has therefore, by a sort of tacit consent, been narrowed to the point of mere usage and habit. Wines, spirits, porter, ales—all less or more alcoholic—are drunk "because it is the custom of the country," "because it is the practice, and people would think it strange if you did not offer them the liquor usually given on such occasions," or "because habit has confirmed a love and inclination for them," or some other equally sufficient reason. It is against these sham arguments and dangerous practices that our author has directed his ridicule and censure. The drinking usages of the Scotch, English, and Irish, are each treated in turn, and with no small degree of quiet humour. We pass over the usages of the Scotch working-classes, and also the usages connected with baptisms, marriages, funerals, fairs, markets, &c., as we alluded to these on a former occasion. In one town, we suppose Greenock, he estimates that £26,830 are spent annually by mechanics in seven drinking usages, such as apprentice entries, fines, and bets, pay-night customs, launch bowls, and so forth. Only a very slight reform, as it appears, has taken place with respect to usages of this nature, notwithstanding the establishment of Mechanics' Institutions, and an increasing taste for reading; nevertheless, the case is not utterly hopeless, and we feel assured that firmness on the part of a few steady and intelligent workmen in their respective professions, aided by the countenance of masters to the cause of temperance, would speedily work a surprising change for the better. Mr Dunlop calculates that the sums spent weekly by mechanics alone on intoxicating liquors, chiefly whisky, would soon furnish in every town in the kingdom commodious lecturing-halls, libraries, public walks, and many other means of elegant and necessary recreation, which at present do not exist except on the most limited scale. If it be true, as has been frequently stated, that upwards of half a million of pounds sterling are spent annually in Glasgow in vicious liquors, we cannot doubt that if this single evil were extirpated, the whole aspect and condition of society would be altered.

The drinking usages among the handicraftsmen and tradesmen of England are fully more virulent, and we fear will be more difficult to unsettle, than those of their brethren in Scotland. Some of them are as ludicrous as they are mischievous.

Shipwrights.—The apprentice footing amounts in general to two guineas. The penalty for non-payment is flogging with a handsaw from time to time; and this and other mal-treatment is pursued till the usage money is paid. In some building yards, it is only about a dozen of the oldest apprentices that enjoy this treat: it frequently is the occasion of two or three days' idleness and drunkenness. At launching there is from five to ten pounds given by the owners of the new ship. Besides this, in some cases the apprentices are in use to wait upon and receive drink-money from dealers who furnish articles for the vessel; such as the block-maker, painter, plumber, glazier, joiner, and others. The whole is expended in a supper and drink by the older apprentices, each bringing his sweetheart, or a friend. Disgraceful scenes of drunkenness often occur in consequence of this usage, which frequently end in jail or bridewell. Such methods of amusement and recreation must further have a very deteriorating effect on the female friends of this class of workmen.

A shipwright's apprentice is expected to pay 2s. 6d. for drink-money at his first caulking. The penalties

for non-payment of usage money are various: sometimes the jacket is nailed to the board with large nails, or the clothes or hat mopped with tar. When the foreman, or others connected with the building-yard, keep a public-house, it has frequently been stated to me by operatives that it is ruinous to the men, and contrary to the interests of the master. "In the eyes of such a foreman," say they, "he who drinks most is the best man."

Foundries.—Among engineers the apprentice footing ranges from £1 to £2, 2s. At expiration, or 'loosing,' there is £3 to £4 for a supper and drink to the men; the employer sometimes gives towards this also. To the apprentice footing each man adds 6d., which makes the usage comprehend the whole of the parties, and thus ramifies its power. A journeyman's footing is 5s., to which the other men add 6d. a-piece. This practice is sometimes called 'backing.' Shifting vice or lathe, moving to a better situation in the work, draws 1s. for drink-money; the others 'back' with 3d. each. Coming on Monday with dirty shirt, or unshaved, incurs 1s., backed by the rest at 3d. each. Marriage is 10s. 6d., backed by the rest with 6d. each. A birth 1s. to 1s. 6d., backed with 3d. each. If not of the trade club (in some places), a man pays 10s. for drink, in order to be free of the particular shop. At Liverpool it is usual to fine workmen in the sum of 1s. for drink, who have been, for the first time, a pleasure sail round the black rock in the Mersey.

With some pleasing exceptions, wages are generally paid in this trade on Saturday night, in a public-house; or the men are clubbed together (it is sometimes called 'linked'), and sent to obtain change where they may; which, of course, leads direct to the public-house. If the day of a man's birth can be discovered, he will be pestered continually to give drink. On national saints' days in England, the following drink regulations have place in this and other trades:—On St George's day each Englishman pays 1s., and each Scotch, Irish, and Welshman, 6d. On St Andrew's day, the Scotch pay double; on St Patrick's, the Irish; and the Welsh on St David's. The employer gives what is denominated a way-goose at lighting of candles; the men 'back' this gift, and hold a supper. Brass-money is claimed at Whitsuntide from the brass merchant, and at new year's day from the iron, coal, timber, and tin merchants.

The usages among whitesmiths, blacksmiths, chain-cable manufacturers, and curriers, are equally ridiculous. The following are customary among joiners and carpenters:—"The apprentice footing is £1 to 30s., backed with 6d. each; journeyman's footing, 2s. 6d. to 4s., backed with 6d. or 1s. each. In some cases the 'loosing' is signalled with drink. On the building of a house, the claim upon the owner for 'rearing money' varies from £1 to £5. All the men who have been employed previous to putting on the roof, enjoy this festive occasion, but not those whose work comes afterwards, such as plasterers. Each man backs the rearing pot with 1s. The men next claim certain sums, varying according to local custom, from the lath-render who has furnished for the house, and from the stone-mason, brick-merchant, and lime-merchant. These last sums are obtained in the manner above stated, denominated in some places 'kicking'; and they are drunk the day after the rearing pot has been disposed of, in order that the parties may enjoy 'a hair of the dog that bit them.' Those who happen to spoil work, called in cant language 'buttoning,' will be informed upon by the others, unless they bribe with drink (mug the witnesses). On obtaining a new bench or station in the work, 4s. for drink must be paid; this is given to benchmen exclusively. Unless an apprentice pays something for drink at making his first window sash, or other difficult operation, he will not be assisted in his work, and no explanations regarding business will be given to him. In the same way drink is demanded in the wheel-wright trade, at the first fastening of spokes in the centre of a wheel. If fines be delayed to be paid, they will be added to according to the period of delay. At marriage, and at birth of a child, 6s. to 10s. is demanded for drink, with backing from each. Wages are generally, though not universally, paid on Saturday night; many do not receive their own net wages, but are 'linked with others.' Sometimes, according to one informant, ten to twenty men are clubbed together, with bank-notes to obtain change where they may: nothing can exceed the tyranny and folly of masters in this respect. On non-compliance with drink fines, or footings, the clothes or tools of the individual will be pawned (put up the spout); he will be 'sent to Coventry'; and otherwise maltreated. New tools and clothes must be 'wetted.'

Besides what is above stated in building houses there are also, in general business, Christmas-boxes demanded from the nail-maker, timber-merchant, and ironmonger. National saints' days are the period of a drinking bout, according to rule. If any man inform on another to the master (called 'sucking' the master), the case is brought before the trade club and decided; if any penalty ensue, it is generally a drink fine. If an apprentice neglects to watch the fire properly, he incurs a drink fine. When a man is made foreman, he must pay 6s. for drink. One leaving a candle in the workshop, without asking some other to take charge of it, incurs a drink fine of 1s. In many cases, the smaller fines are not drunk till they amount to £1, when a 'spree' takes place. Dirty shirt and long beard on Monday, incur drink fines. One informant had not only to pay fines, but was struck and

* London, Houlston and Stoneman, 1 vol. 1838.

maltreated for not partaking of the liquor. If fines and footings are not paid, tools are hid; particularly the special tools required at the time. This is called 'making an old woman of one.' If the recusant acquaints the master, the fine is doubled. There is an occasional way-goose, but it is not universal. The same informant mentions, that if fines and footings were not paid, after all other schemes fail, a strike would ensue, and the employer be forced to dismiss the operative. As we before had occasion to state, with regard to the regulations of various trades in Ireland and Scotland, there is here a tribunal for the purpose of trying all questions which infer drink fines. A man is said, under these circumstances, to be tried under the strong beer act. Sometimes the court is formed of men in the same workshop, at other times of persons selected from various shops. One informant has seen a man fined in four gallons of ale, and a foreman in eight gallons, on such an occasion."

The author next describes the usages among coopers, sawyers, tailors, coachmakers, watchmakers, and some other classes of artisans. Among tailors, "the penalties for non-compliance with drinking usage are various. One is being 'sent to Coventry,' sometimes called being 'made a dog.' This is a most uncomfortable state for a tailor to be in. All manner of jeering and ill treatment is considered justifiable, nay, a matter of duty to the trade, in this case. The culprit has broken a law of the business; he has aimed a blow at the social indulgences of all the tailors in the queen's dominions. It is therefore obligatory on every man to resent this as an injury done to his individual self. No maltreatment is too severe for such a case. In the language of the shop, 'waste meat and bones are thrown to dogs.' This is such a pitiable state of debasement and excommunication from every good office, that, besides paying up all fines and footings, there is sometimes 5s. imposed as a special amercement, before the convict can be reinstated into 'pitcher law.' And, seriously speaking, it is perhaps difficult in modern times to point out a more grievous state of persecution than a man is hereby subjected to. The sleeve lining of a 'dog' is twisted and sewed up; triangular holes are cut in the rim of the hat; the man's clothes are sewed up in different forms, to look like a bundle of rags; candles are put out quickly at dismissal of the shop, and he cannot put himself to rights till he arrive at home. The seams of clothes and pockets are ripped open—an informant has known money thus lost—clothes are secreted and 'put up the spout' (pawncd). The master, in all these cases, can give no relief. The unfortunate non-conformist, wearied out with a series of insult and injury, must at length yield to the influence of drinking usage; the young are led to consider drinking as a necessary business and duty of life, and are soon as inexorable as their neighbours in exactness to support the system; while the wretched men whom this wretched tyranny has compelled into habits of inebriation, find it impossible to retrieve their character, or alter their conduct, amid the unconquerable craving of a vitiated appetite, seconded by the invincible pressure of perpetual and systematic compulsion."

The custom among printers of holding "chapels," which has been often described, still exists in most parts of England, greatly to the demoralisation of the trade and the injury of the master. Mr Dunlop alludes to the chapel usages of printers, but appears to be unacquainted with the heights to which they are sometimes carried. We have been informed by a respectable London printer that he dares not buy ink to be used in his establishment, unless his workmen are on good terms with the ink-manufacturer. For every new cargo of ink, the men expect a present of money from the maker, which is spent in drink. If the maker do not give enough, or should refuse to give any thing, complaints are immediately raised that there is sand in the ink, and that it will not work. In other words, the property of the master is sacrificed in revenge for the ink-maker's refusal to accommodate himself to the usages of the trade. We are not aware that this odious practice prevails generally among the printing trade in England, but that it exists to a certain extent, is placed beyond a doubt by what has been mentioned to us, as above.

A glance at the widely-spread drinking usages of England, of which the foregoing are a mere scantling, cannot fail to impress the conviction that all the ordinary means of social improvement now in operation, must prove next to unavailing, unless these usages be in the first place attacked, resisted, and utterly extirpated. It is a positive disgrace to the section of temperate and intelligent individuals who are to be found in every branch of trade, that they should thus submit to the tyranny imposed upon them by their fellow-workmen—a tyranny more iniquitous than that ever attempted to be established by any civil power on the face of the earth.

We shall return to this subject.

THE ALPINE HORN.

Amongst the lofty mountains and elevated mountain valleys of Switzerland, the Alpine horn has another use besides that of sounding the far-famed Ranz des Vaches, or Cow Song, and this is of a very solemn and impressive nature. When the sun has set in the valley, and only the snowy summits of the mountains gleam with golden light, the herdsman who dwells upon the highest habitable spot, takes his horn and pronounces audibly and loudly through it as through a speaking-trumpet, "Praise

Lord God!" As soon as this sound is heard by the neighbouring huntsmen, they issue from their huts, take their Alpine horns, and repeat the same words. This frequently lasts a quarter of an hour, and the name of the Creator resounds from all the mountains and rocky cliffs around. Silence at length settles over the scene. All the huntsmen kneel and pray with uncovered heads. In the meanwhile, it has become quite dark. "Good night!" calls the highest herdsman again through his horn. "Good night," again resounds from all the mountains, the horns of the huntsmen, and the rocky cliffs. The mountaineers then retire to their dwellings, and to rest.

FIRST GRIEF.

[BY JAMES HEDDERWICK.]

They tell me, first and early love
Outlives all after-dreams;
But the memory of a first great grief
To me more lasting seems;
The grief that marks our dawning youth
To memory ever clings,
And o'er the path of future years
A lengthen'd shadow flings.
Oh, oft my mind recalls the hour,
When to my father's home
Death came—an uninvited guest—
From his dwelling in the tomb!
I had not seen his face before—
I shudder'd at the sight;
And I shudder still to think upon
The anguish of that night!
A youthful brow and ruddy cheek
Became all cold and wan—
An eye grew dim in which the light
Of radiant fancy shone.
Cold was the cheek, and cold the brow—
The eye was fix'd and dim;
And one there mourn'd a brother dead,
Who would have died for him!
I know not if 'twas summer then,
I know not if 'twas spring,
But if the birds sang on the trees,
I did not hear them sing;
If flowers came forth to deck the earth,
Their bloom I did not see—
I looked upon one wither'd flower,
And none else bloom'd for me!
A sad and silent time it was
Within that house of woe,
All eyes were dull and overcast,
And every voice was low!—
And from each cheek at intervals
The blood appear'd to start,
As if recall'd in sudden haste,
To aid the sinking heart!
Softly we trode, as if afraid
To mar the sleeper's sleep,
And stole last looks of his pale face,
For memory to keep.
With him the agony was o'er,
And now the pain was ours,
As thoughts of his sweet childhood rose
Like odour from dead flowers!
And when at last he was borne afar
From the world's weary strife,
How oft in thought did we again
Live o'er his little life!
His every look—his every word—
His very voice's tone—
Came back to us like things whose worth
Is only prized when gone!
The grief has pass'd with years away,
And joy has been my lot;
But the one is oft remember'd,
And the other soon forgot.
The gayest hours trip lightest by,
And leave the faintest trace;
But the deep, deep track that sorrow wears,
No time can e'er efface!

—Scotsman newspaper.

INCLEDON AND THE LOIN OF PORK.

In the course of travelling together, Mr Incledon and my husband differed in few things more than in their tastes in eating. Mr Mathews liked the simplest fare; Mr Incledon was always in search of an appetite, and therefore was very fastidious about the wherewithal to tempt it. On one occasion, at some town where they stopped only to change horses, Incledon, according to a habit in which he indulged, sought out the larder, and seeing a small undressed loin of pork displayed through a glass window with other delicacies, he fell deeply in love with it, and immediately applied coaxingly to the landlord (a portly independent sort of person, with his hands in his waistcoat pockets), to be allowed to purchase it to carry onwards. Mine host abruptly refused; "he could not sell it—he should want it for his dinner customers," &c.; but in proportion as the landlord seemed unrelenting, Incledon's anxiety became stronger. He asked what the joint would be charged to his dinner customers, and then held out the sum with an addition; but the sulky landlord was inexorable. The epicure increased his temptation, until at last he offered double the worth of it; and Mr Mathews, ashamed of the childish behaviour of his *chum*, left him with the landlord to settle the important matter as they might, and walked on, telling the servant to wait for Mr Incledon with the carriage, and overtake him on the road. In a short time he saw it approaching with Mr Incledon, who, after my husband had seated himself, and the horses were proceeding, took out a handkerchief from a pocket of the carriage with

some appearance of mystery, and deliberately placing it upon his knees with evident satisfaction, opened it, and revealed the coveted little loin of pork! "Well," said his friend coldly, "what, you prevailed at last; how did you manage to coax that surly fellow out of it?" Incledon twinkled his eyes: "Charles Mathews," said he, with something of solemnity, "I did not prevail. My dear boy, the man was a brute. I offered him all the silver in my pocket. I had set my heart upon the thing, my dear Charles Mathews. I couldn't have ate any thing else, my dear boy; so what do you think I did? Don't be angry, Charles (and here he looked like a child who knew he had done wrong, and dreaded the punishment for his fault), don't be angry; a man like yourself can have no idea what I feel, who want little delicacies to keep up my stamina. My dear Charles, the man was unfeeling." In this way did Incledon prepare his companion for the truth, and deprecate his wrath. The fact was, he had watched the landlord's absence, entered the larder unperceived, and bore away the tempting prize, leaving the already proffered double its value in its place. —*Life of Charles Mathews, by his widow.*

PROGRESS OF NATIONS IN AMERICA.

In the newer American states it is customary to celebrate the day on which the settlement of the district or town, or whatever it may be, took place. The fiftieth anniversary of the settlement of Cincinnati was lately celebrated, this being now a town of 50,000 inhabitants, exporting annually seven or eight millions of dollars' worth of agricultural produce, and having often forty or fifty steam-vessels lying at one time at the wharves. The whole territory was purchased at the beginning for forty-nine dollars. One old man attended the celebration, who had himself made the roof of the first house shingled in the place. A Mr Tappan, whose age is about sixty, and who was lately chosen one of the Federal Senators for the state of Ohio, resides in a large town called Ravenna, where he was the first man to cut down a tree. This state, in forty years, has acquired a population of a million. Florida is now about to apply for admission as a state into the Union. For this she must show a population of 50,000, which it is expected she will be able to do next year. Next year, also, two more territories, called Iowa and Wisconsin, which began to be heard of in America last year, and are as yet totally unknown in Britain, are expected to be in a similar condition, and to make the same application. The United States will then be twenty-nine in number, instead of thirteen, as in 1775; and the stars on the national banner must be numbered accordingly. An additional illustration of the mushroom progress of all things in America, is obtained from the fact that the steamers on the western waters of the States have increased from 234 to 600 in the short space of five years. The States have now 800 steamers in all, of 155,000 aggregate tonnage, the largest being a vessel of 860 tons (!) which runs between New York and Natchez. —*Collected from a letter in the Athenæum, dated "Boston, January 16, 1839."*

RATIONALE OF PROPERTY.

Why, it has been asked, should man be allowed to appropriate more than is necessary for his support? We ask, what support is meant? The momentary satisfying of his hunger by shooting a deer or plucking a fruit? Is he allowed to shoot several deer and dry the meat for the winter? Is he not allowed to cultivate a tree which shall give him fruit for certainty, so that he may not be exposed again to hunger, the pain of which he knows already? May he not cultivate a patch of land to have corn for his children? If he has slain a buck to satisfy his hunger, is he allowed to appropriate the skin to himself and call it his own? If the industrious fisherman sails to the bank of Newfoundland to appropriate to himself the unappropriated codfish, has he no right to catch as many as he thinks he and his children shall want for the whole year? But they cannot live upon codfish alone: may he not take so many codfish as to exchange part of them for other food, for clothing? Does supporting his family not include the sending of his children to school? May he not catch some more to save the money he may obtain for it, that, should he perish at sea, his wife and children may not suffer from want or become a burden to others? Where does the meaning of support stop? Why should it apply to the satisfying of physical wants only? There are wants far higher than these, the wants of civilisation. We want accumulated property; without it, no ease; without ease, no leisure; without leisure, no earnest and persevering pursuit of knowledge, no high degree of national civilisation. Aristotle already lays it down as the basis of high civilisation to be free and have leisure. —*Lieber's Manual of Political Ethics.*

THE TURNSPIT.

Louis XI. of France once took it into his head to visit the kitchen, and see what was going forward. He there found a little fellow about fourteen years of age, busily engaged in turning the spit, with pork meat. The youth was handsomely formed, and of so engaging an appearance, that the king thought him entitled to some better office than the humble one which he then filled. Addressing him, Louis asked whence he came, who he was, and what he earned by his occupation. The turnspit did not know the king, and replied to his interrogatory without the least embarrassment, "I am from Berny, my name is Stephen, and I earn as much as the king." "What then does the king earn?" rejoined Louis. "His expenses," replied Stephen, "and I mine." By this bold and ingenious answer he won the good graces of the monarch, who afterwards promoted him to the situation of groom of the chamber.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
St PAUL.

THE LANDLORD AT HOME.

IN the prosperous county of Wexford—my own dear county—there is to be seen much that will rejoice the hearts of all who desire the improvement and happiness of Ireland. It has but little natural beauty to boast of. We have certainly one or two fine rivers, and, besides a number of hills, one mountain—a genuine mountain—"the Mountain of Forth," the great magician of my youthful imaginings. I remember when I used to climb the flowery ascent at the back of my home, turn my eyes towards that time-honoured mountain, and, with childish sagacity, foretell, by the clouds either hanging above or resting on its summit, whether or not the day would be fair.

No sea to me ever looked so beautiful as that which bounds the county Wexford, particularly that portion of it which extends from the long thin tower of Hook to the capacious harbour, where the shifting sands are as variable as a lady's humour. The Saltee and Keerogue Islands are set like emeralds in its crystal waters, which chafe and fret against the dark rocks that in winter frown to scorn the mariner's craft, and send his treasures "full fathom five" to mingle with the silver sands of their creeks and foaming bays. The fine sea scenery is beheld to great advantage from the mountain I have mentioned—that dark rocky mountain, behind whose crags, and in whose crevices, shelter scores of hardy mountaineers; fine specimens of the animal creation, but rather fond of having their own way, and not inclined to render obedience to any code of laws that would at all interfere with "their own sweet will." Still they are brave, honest, and hospitable, and look quite as picturesque to my fancy on that noble mountain as brigands on the finest Italian crags that ever were painted. I remember once having achieved the highest peak of Forth, and I do not think I ever beheld a landscape that delighted me so much as on that day. In the immediate valley to the right, the fertile barony of Bargo, as remarkable for its agricultural as its antiquarian riches, spreads its corn-fields and verdant meadows, and innumerable castles in various stages of decay, showing that it must have been both valuable and debateable ground in the "good old times," and giving the scene an air of feudal grandeur and magnificence that filled me with dreams of the past. The park, superb woods, and turrets of Johnstown Castle, told their true and happy tale of present good, for the flag streamed gaily from the highest tower, giving token that the landlord was—where a patriot ought to be—AT HOME, dwelling on his own land—the fountain of blessings to his people. Many other abodes, of small extent in comparison to Johnstown, are also inhabited by the landlords of the soil, and to this I attribute the county's prosperity and peace. The silver sea that bounded the land on the right was speckled with fishing-boats: occasionally the broad sails of a stately merchant ship would float along like a sea-queen, and the soft, white, cloud-like streak of an arriving or departing steamer tell of that rapid commerce which the good folk of the barony know how to turn to advantage. I was enchanted with the scene, and expressed my admiration warmly; when suddenly a bold, brown, ragged fellow, with the frame of a Hercules and the grace of an Apollo, came up to us, and, evidently delighting in my delight at the glorious expanse of land and water, flung off his coat at my feet, and said, "The rock is damp and could, my lady; ah, thin, stand upon that; sure it would be bad manners of the mountain to do ye any harm, and you so played with the fine ould craythur."

I vowed in my heart of hearts never to say a word against the mountaineers, and all for the sake of Dan'el Devereux, who, with many others, had built

his hut of the mountain's granite, and paid no rent for that or his mountain garden to any one; thanks to his gallantry, I would not, even if the law gave me the right, ask either Dan'el or any of Dan'el's people for rent or tithe. I should very much like to transport certain of my friends to the peak of the mountain of Forth, where I lingered from noon till evening; and after admiring the glory of the sea, and the fertility of the land-view, descend with me into the valley, and there behold, on the estate of one particular LANDLORD AT HOME, as much peace, safety, and comfort, as are to be met with in any part of England.

I hear dozens of persons exclaiming against Irish dirt! Irish mismanagement! Irish this and that! and I exclaim against these things myself. I know they exist to a frightful degree, and to a frightful extent; but my heart beats high and proudly at the knowledge of what good and patient management can effect with the Irish peasant. I say patient management; without patience and temper no system of improvement will work well in Ireland. Paddy would worry the angels with his prejudices, and unless you laugh with him, he is apt to become muleish; but, *get at his heart*; convince him by deeds, not words, that you seek his good, and he will show his gratitude by trying to please you. Here is my proof:—An estate unencumbered, bringing in to the possessor several thousands a-year, spent by himself in the country, the money as it were returned to the tenant, with the rich interest of protection and kindness. Three hundred labourers constantly employed on this estate. A school-house, beautiful to look at, and useful in its construction, built and supported without any regard to expense, at the gate leading to the princely domain; the master, a man qualified in every respect for his occupation; no religious distinction made, and none thought of, either by the learned or the learner. Cottages built in the midst of flourishing gardens; roses and woodbines clustering round their windows; the landlord doubling the amount of whatever prize his tenants may receive from agricultural societies, as encouragements to good conduct. No wild pigs, no beggars, no dunghills, no fear, few whisky-shops, little quarrelling, very little idleness; clean, healthy, well-dressed children; the prettiest girls and "neatest boys" in Ireland. You ask of the landlord's and landlady's religion: both are members of the church of England; some of their servants are Catholics, some Protestants. I never heard the sound of religious difference in their household, where I have spent some of the happiest days of my life; the Catholic priest seconds all their plans for the improvement of the country, and by night and by day their house is open to relieve either sorrow or sickness; there are no traces of extravagance in their arrangements, though the park is full of deer, and the merry horn frequently calls forth the stag-hounds to the chase; but little is spent in vain entertainment, though great is the outlay of actual benevolence; every new improvement is tried at home before it is adapted to cottage use, and Paddy sees the good with his own eyes before he is called on to adopt it: this is especially necessary, for my countrymen love "ould ways," and I doubt much if my beneficent friends would be as honoured as they are, were it not that the people know "that they are come of a good ould stock—none of yer musharoon gentry." This is not an Irish Utopia of my own creation; it is, to use an Irish phrase, "to the fore;" any one sceptical as to the possibility of Irish civilisation may go to Wexford, and drive in half an hour to Johnstown Castle, where he can see what I have described; and more—for the proprietors have introduced amongst the mechanics, as well as the agriculturists, a hitherto unknown taste, by fitting up certain rooms in the castle with oak carvings after the antique, which would do no discredit to our best artists in that way, and prove what can be done not only in the country, but by the countrymen themselves, when there is a kind and liberal spirit to draw

forth and foster their abilities. How trite is the observation that "Rome was not built in a day!" Neither are the Irish to be won round to neatness, and order, and comfort, and "all that sort of thing," in a day.

A few years ago, a *posse comitatus* of the peasantry were sitting and lounging and idling away some fine hours of a sunny Sunday round the door of a public house near one of the entrances to the deer-park in the neighbourhood I have mentioned; there was Michael Gabbett the smith; Jeremiah Mackay, his wife, and daughters; Gerald Murphy, Phil Dwyer, and a certain Anty O'Toole, the belle and beauty not only of the parish of Rathaspeck, but of a much larger district. Some were sitting on the stone fence, others were shouldering the old piers, that, truth to tell, looked as if they could not bear a great deal of rough usage, though they had stood many a storm. Abel Connor, a handsome, fine-looking fellow, half mason half farmer, was evidently bent on making himself agreeable to the pretty Anty, who, to do her justice, seldom flirted more than a very pretty cheerful-hearted girl might flirt in all propriety. She did not think there was a great deal of harm in teasing Aby, because Aby not only was handsome, but thought himself so—a piece of impertinence, which women are bound to punish as an encroachment on woman's prerogative. The truth was, he thought no girl in the county could or would refuse him—a delusion by no means confined to handsome men. Anty O'Toole had a great deal of good practical sense, and a taste and desire, not beyond her means, but beyond, or what was called beyond, her station; this taste had grown upon her, and had originated in one or two causes; the principal one being, that she had resided a good deal in the houses of the resident gentry, and had learnt to contrast the thoughtless and reckless extravagance of some, with the prudence and good conduct of others.

"I'll tell you what it is," said Michael Gabbett, who was a regular whisky-shop orator—and, by the way, as the greater number of my readers do not know what a whisky-shop orator is, I will pause a moment in my tale to describe him. Be it remembered, that while beer stupifies its inordinate consumers, whisky renders them emaciated; and, accordingly, our orator has a lean, yellow, haggard look; his lips are thin, his teeth discoloured; and even when he declaims coolly, which is seldom the case, there is a tremor and twitching about his mouth, that speaks of habitual intoxication, though the fever may not then be in its strength. His eye at such times has nothing in it; it is not sober, but dull and bleared; its natural fires have been long extinguished, and it is only after strong libations that those *spirit-lamps* blaze up, with a fierce and unearthly light, that renders the cadaverous aspect of his countenance still more fearful. His brows are shaggy and loose; his hair prematurely grey; his beard unshaven, for his hand is so unsteady that it cannot perform the necessary task; and as he has lost credit even with an Irish barber, he cannot always pay for the operation. His stockings sit loosely on his shrunk legs—for the grass is not yet green on the grave of his broken-hearted wife, and his little shoeless girl is unable to knit him new ones; his blue long-tailed coat hangs awkwardly from his shoulders, and one of the skirts bears the mark of having been nearly torn off; the tie of his faded neckerchief is never straight; his waistcoat has been green, but now it is grey, and the buttons are almost all departed; the strings at his knees are either knotted or vanished, and his hat leans more to one side than the other; the binding is worn off the edge, and the band has been replaced by a piece of cord, in which his pipe is stuck jauntily, and, it may be, one or two speeches he has cut from a worn-out newspaper are also folded under it. When he reads, he sits on the table of the shebeen shop, while his auditors lounge (an Irish peasant seldom stands erect) or crouch around him; his legs dangle

LIBRARY U.C. RIVERSIDE

from the table, though, sometimes, animated by his energy, he makes them emulate the action of his arms; and what he reads now, having often read before, he interpolates with various passages of his own. After this, he declaims much too long upon subjects which are forbidden in my pages, and which I think it would be better were less thought of elsewhere. Such was Michael Gabbett—such was not Abel Connor; and when Anty O'Toole looked at the contrast, she vowed in her heart of hearts, that, if there was any chance of Abel's ever being such a man, why—she'd die before she'd marry.

This particular evening Michael was not very tipsy; he was only half so, and was sitting on the step of a style leading into the park. He had just put up a tattered newspaper, and commenced—"I'll tell ye what it is: there has been what is called a long minority on this estate, and there is a noble, a very great fortune intirely; but, ye see, the master and the mistress have been to furrin parts; and though they staid away a very little while, yet it's very sartin they are full of new improvements; there's a fine flash-my-eye school-house building. I—don't—like—that."

"Why don't you like it?" inquired the pretty Anty with dancing eyes; "why don't you like it, Michael?"

"I've my reasons, Miss Anty O'Toole; miss, I've my reasons; and, having my reasons, Miss Anty, I'm reasonable; and, being reasonable, Miss Anty, I don't feel bound to talk rason to a woman who's always unreasonable. That's logic; aint it, boys?"

"It's a sin you warn't a schoolmaster instead of a smith," said old Molly Mackay, for Michael had a great reputation amongst the old people for wisdom.

"It was indeed, Mrs Molly Mackay, ma'am, a grate pity and a sin. I never took right to the smithy."

"That's the reason ye're so seldom in it, I suppose, Mister Gabbett," said the saucy Anty.

The lazy smith rolled his lack-lustre eyes on the bright girl.

"Why do ye say that hard word, Miss Anty?"

"Because it's talked of through the country that you might have had a chance of the work of an iron gate for the mistress's school, if you could be depended on; but you couldn't."

"The country talks folly; I wouldn't do the gates. I'm a patriot and an honest man, and I've my reasons for—not—liking—the—school."

"And what's in the reasons you have, sir, if a poor uninstruited girl like myself might make bould to ask, Mr Gabbett? What's in them? Sure the children are to be educated, and have tickets given them, which, at the end of the quarter, if they are well conducted, will gain them clothes; and learning is a fine thing. Why, I am told that even if the boys have a talent for *mathematicks*, they are to be let learn them." And Anty looked round triumphantly.

"And who's Matthew Matticks, to set up for a teacher?" inquired Michael Gabbett contemptuously.

"It's not a man, but a—learning," answered Anty; "a learning of great advantage to such as can get round it. A thing to make people think; and, for any thing I know to the contrary, get them both to, and through, and out, of the College of Dublin."

"Oh, ye get grate larning, ov course, at the big houses, miss; but I wonder what Father Sinnott will say to it? Do you go to your duty, Miss Anastasia?"

"Thank ye for nothing, Misther Michael. Ye're not my father confessor, any way; and I hope I'm not content with only GOING to my duty; I try to do my duty. And as to Father Sinnott, he's as glad of the school as ourselves."

Michael Gabbett made a very peculiarly ugly face, accompanied by an expressive twist of his mouth, and a comical blink of his eye, which always assisted his eloquence, because every one laughed at it. But Anty did not laugh; she grew angry.

"Father Sinnott is glad of it," she said with dignity; "and if you don't believe me, here he comes himself: ask him."

As soon as the priest appeared, every one arose; Michael Gabbett even stood up; the little children needed no bidding, but curtsied to "his reverence," and drawing near their mothers, looked at him with silent respect.

That good old priest is now in his grave, and I am sorry for it; though I hear his successor is a kind man also. If so, Rathaspeck has been greatly favoured—a good priest and a good landlord; good clergymen, too; a good school, and all manner of good examples. No wonder the people prosper! But to return to that good old man and his flock. After the usual interchange of prayers and blessings, Anty, curtsying and blushing, approached the priest.

"Well, Miss Anastasia, and when am I to say the words for you, eh? But it's Abel that ought to make the bargain, Anty, not you. I wont bargain with you; you'd be trying to come over the priest with your bright eyes and sweet smiles to get a bargain, you deluder!" The assembly laughed, and exclamations of "Long life to him; what a hearty* man he is! God bless him; he's a fine gay† old gentleman!" were heard among the crowd.

"It isn't that, yer reverence, at all," blushed Anty still more deeply; "only, if you please, I said that your reverence would be glad of the school our landlady's building on a corner of the park, and Michael Gabbett said you would not."

"Without wanting to fight Abel Connor, on account of contradicting his sweetheart," answered the orator, "that's not thrue, yer reverence; I appeal to the people!"

"If you did not say it, Michael, you made an ugly face," said Anty, "and that was worse. You made a face at his reverence."

"Oh fie, Anty! Oh! oh! oh! Anty!" echoed around and about.

"Never mind," laughed the good-natured priest, taking a huge pinch of snuff, one half of which settled itself in the folds of his ample waistcoat; "I appeal to all here if my friend Michael could make an uglier face than the one he's forced to put up with working-day and Sunday."

"But the school, father, if you please, sir," persisted Anty, like a cat or a woman, sticking to her point.

"My good people, I'm sure the school, in the hands it's in, will be a blessing to the country. The gentry that's doing it are of a good old stock."

"I beg yer reverence's pardon, but an ould stock doesn't like grafting," said young Mackay, who was following, at a humble distance, in the steps of the public-house orator.

"Oh, then, look at his manners," exclaimed the ready Anty, "to interrupt a priest!"

"Where would he get manners," answered Father Sinnott, "or grace! I haven't seen him at my foot for many a day; and I'll tell you what, my nate boy, you'd be the better for grafting, that you would; only, Peter, I'm afraid what would be in the old stock would poison the graft." This raised a laugh at Mackay's expense, who shrunk behind the group; but Connor, who was exceedingly out of temper at something Anty had whispered him, exclaimed, "Aint we to complain at not being allowed to till the ground our own way! I do think it's cruel hard that we're obliged to pay for the land, and yet must farm it exactly in the way that the master or mistress pleases."

"And cows stall-fed, and supervisors appointed to see what we have, and do, in our own houses, reporting every thing at the castle!" exclaimed the orator.

"As to the land, Abel," answered Father Sinnott, "throw up the bit you have when you please; you knew the conditions when you took it, and there's scores will be glad to get it. I don't understand the house-feeding or the green crops, Michael, but you'll find them spoken of in Mister Martin Doyle's books; and as to the gentlemen employed by the mistress to look at the cabins, you know that where misery exists, it is relieved; and where industry and cleanliness are found, they are rewarded. I'm glad," added the priest laughing, "they have not visited me; no one would think there was a smith in the neighbourhood, and the priest's gate wanting a latch; no one would think, Abel Connor, there was a mason nearer than Wexford, and the step to the priest's door rooted into marbles by the pigs." After these, and a few more priestly admonishments, mingled with excellent advice, the venerable man intimated to his sleek fat mare that she was to proceed, which she did at a pace something between a shuffle and a walk.

Anty O'Toole knew that the priest's words would make their impression, and, wishing a kindly good evening to "the neighbours," she set out by a short cut across the park on her way home. Abel Connor had walked a little way down the road with young Mackay, and the first intimation he received of her flight was from seeing her crossing the hill in the distance with a swiftness which emulated that of the fawn. Abel sprang over the fence, and was soon out of hearing of the laughter of his companion. He did not overtake the runaway until she was by the bank of one of those enchanting streams where the water is so pure, the grass so soft and green, the trees so luxuriant, that it might be imagined the chosen spot for the fairies' revels that haunt the sylvan spring. It was bewildering in its extreme of loveliness; the most beautiful spot in this most beautiful park—the most beautiful at all events, but one, towards which Anty was hastening.

"Is it going up to the ould church of St Kevin you are, Anty? Well, it's I that am glad of it, for I'll be the longer in yer company. Oh, you will dear, to run me such a race!" said the hunting lover.

"I never asked you either to come or run," replied Anty; "and, indeed, maybe you had better not come, for you will hear what will not please you. God be good to us! but the ancient ruin does look beautiful! and the shine and glitter of the setting sun, how bright it is, coming through the trees upon the ivy and the grey ould stones, and turning it all into fairy gold and silver, just the way youth, and hope, and all that, shines every thing to their own colour for a while, until it turns! It is doing it now; you see the colour is fading while I speak; there—there—and now the ivy is green, and the stones are grey, and the brightness of the gold and silver is gone; and by and bye the moon will rise, and then that will be like the ease, and silence, and quiet of the sleeping graves."

"What's over ye, Anty?" exclaimed Connor, seizing her hand. "I never heard you talk this way before. Sure ye're not angry with me for the thrife of temper I showed above there. I did not mean it, only your people are all for improvements, and that like, and the Connors stick to the old ways."

"I'm not angry with you, Abel, but I'm sorry for you, that's all. I wonder a knowledgeable boy like you would set the back of yer hand* against improvements, and ye seeing the good of it. There isn't a thing the

master or mistress proposes, that has not been tried and known to prosper in their own place; but that you should turn against me with a set of such poor cray-thurs, ignorant both of the laws of God and man! Oh, Abel, I did not expect it from you, and you that know so much better!"

"Anty!"

"Now, don't talk so fast, Aby; you always have the talk to yourself; but it's no use now, none in the wide world. I've made up my mind—"

"Darlin', Anty—"

"It's no use, Abel; none in the world—I'll never be tied to a boy that won't be convinced; nor I wont be tied to a boy that consorts or *oomrades* with Michael Gabbett, or any of those lounging people that we left there below. Leave me now, for I'm going to say a prayer at my poor mother's grave, and tell her I haven't forgot the promise I made her."

"And what was that, Anty?"

"To see what a man was made of before I married him. And now, once for all, Abel, let every thing be over betwixt us, or make up yer mind to wait two years."

"What!"

"Two years, Abel—no less; by that time maybe I might have some chance of seeing what you are made of; by that time we shall know whether the changes are improving or not; they've been going on some time already; if we come together now, we'd do nothing but quarrel about them. Be easy, now; there's no use in running into contention or poverty. I'll see what you are by that time, any way, and you'll see what I am; and as to living with a man, and not agreeing with him, like Poll Shea and her husband, I'll never do it—so that's enough. Ye're free of yer promise from this moment; as to me, I never gave you one."

Abel stormed and prayed, and I suppose swore; but Anty was determined, and the lovers parted, not exactly understanding whether or not they were lovers any longer.

It was evident to all who wished the improvements in progress to prosper, that the peace, comfort, and prosperity of the neighbourhood, were greatly increased by the fact of Michael Gabbett's having been suffocated in a pool of stagnant water outside his own door. He had wound up an oration that very Sunday evening touching the advantages of old times and old customs, until, owing to the combined influences of strong whisky and weak reasoning, the company, at first admiring, became uproarious, then very tipsy, and, finally, so really intoxicated, that he, after blinking home in the moonlight that shone so peaceably on the ruined church, stumbled over some stones, and his face sank in the stagnant pool. It is worthy of record, as connected with this unfortunate man, that the last words he said when leaving his companions were, "I'll have my own way; I'll have no new improvements; I'll—never let—an improvement near me—or mine!" He had resisted all advice to remove the pool, that, like a treacherous and unworthy friend, destroyed him at the last. What rendered it still more remarkable was, that the typhus fever broke out amongst the poor parentless children of this bad man, and spread only in those cottages which had withstood all attempts at purification in the way of whitewashing and cleanliness. This was so practical an evidence of the effects of neglect and its consequent ruin, that the greatest murmurers were silenced; and the excellent agent, who had ever gone hand in hand with his excellent friends in improvement, seized upon every little occurrence to work out the great object of showing the peasants not only how they could be benefited, but how they could benefit themselves. Instead of shrinking from the "inspection" of the state of their cottages, and its subsequent report, when rewards of merit were bestowed by the hands of their "own" mistress, if the report was favourable, they learnt gradually, some of them so gradually that it would try the patience of a saint, but still they *did* learn to look forward to these rewards with pride and pleasure, and to feel the approbation of "the landlord at home" a reward of almost as much value as the "shining siller," or sometimes "gold," which they received. Mrs Mackay herself was heard to confess "that it was a fine thing to see her bits of grandsons getting genteel learning and purty bits of clothes now and again out of the school, and to have the master on the spot, without any pride in him, to ask a favour of, which was sure to be granted, God bless him! And the mistress, so active, and kind, and good, only mighty fond of having every thing done regular; but, somehow, when things war done as she ordered, they turned out best." This was a great deal from Mrs Mackay, who was a professed grumbler.

But still the way was by no means clear for our perseveringly domestic landlord. One morning the lady visited one of those pretty cottages, whose building she had herself planned, and whose flowers and culinary plants had been supplied from her own garden; the cottage consisted of four rooms,* two below and two above, the floor of the lower rooms composed of strong lime cement. Now, it had occurred to the sapient occupier of the cottage that he would rather thrash his corn in that room than in the shed; and as the ceiling interfered with the action of the flail, and Paddy could

* My friends have, however, found that the peasants are more comfortable in two-roomed cottages, with sheds, &c. at the back, than in four-roomed ones, which seem almost too much for them to attend to.

* Cheerful.

† Happy.

* Anglice—set your face against.

not conveniently remove it, why, according to ancient practice, he scratched a wise thought out of his "coolan," and dug a deep hole in the floor; and in this hole was he thrashing away right merrily to the tune of "the Rakes of Mallow," when his fair young landlady entered! This is only one of scores of similar little annoyances which landlords, bent on *home Irish improvements*, meet with—the Irish are so fond of making a thing serve any purpose but the one it was intended for; fond of giving their pigs, poultry, and cattle, abundance of air and exercise at their neighbour's expense; an almost unconquerable aversion to plant trees, though the landlord offers to register them in the planter's name, by which means they become his property. Fortunately for the Johnstown peasantry, their bad habits are firmly resisted, but resisted with the most inconceivably good temper, which certainly is as a halo round the inhabitants of that fine old castle: the reward to such benevolent hearts, even now, is great.

"We know," said an old farmer to me one day, "that it's for our good; for sure they're in it themselves, to see and understand the difference."

To return to Abel Connor: he declared loudly and strongly his determination not to be put upon by any woman; and for what?—just that he would not farm according to other people's fancies, and liked a bit of fun: that was the worst any one could say of him. And this was certainly true: he made love to half a dozen girls at least, and all at the same time. This was very shocking, at least so all the girls said, except the particular one to whom he chanced to be making love at the time when it was declared "shocking" by the others; but, somehow, though he talked every fine Sunday evening as much nonsense to the fair sex as an Irishman can talk, and that truly is a great deal, still he made no direct offer of his hand and heart to any. Anty continued to improve and earn money—earn money and improve; and many said they believed, after all, that Abel Connor would do more at the new farming than at his trade. Despite his gaiety and self-confidence, the death of the orator had made a great impression on him, although the mortification occasioned by Anty's conduct rendered him for a time susceptible of little else than what he called her injustice; but frequently the fact stared him in the face, that Michael Gabbett had scorned improvement, and lost his life in consequence of his attachment to the stagnant pool at his own door. Whenever he felt himself inclined to grumble at the new change, the vision of the suffocated whisky-shop orator would rise before him, and, somehow or other, he had so sobered down before the expiration of eighteen months, that he felt half inclined to forsake all others, and return to his first affection; but pride prevented him. Anty's good conduct had recommended her to the favour of the lady of the castle; and though he longed most ardently for one of the pretty new houses he was assisting in building, and had saved enough to stock and plough, being moreover convinced that plans which worked so well for others must work well for him, still he was obstinate.

Now, I confess that my friend Anty was to the full as obstinate as her old lover; and so they went on, she peeping at him through the pearl edge of her straw bonnet whenever she saw him at mass, and he peeping at her through the great trees of the park, or through the battlements of the new old castle that flank the beautiful lake; and there and every where did Abel wander to see if Anty "would speak first;" his heart, poor fellow, had returned to its first affection; it was asserted that he flirted less than any other young tradesman or farmer in the neighbourhood, and very likely that was true, for they flirt a great deal; but still, though the two years were expired within a day or two, the "first word" had not been spoken. Abel was hardly called upon to give up idle acquaintances, for the very idle were no longer tolerated by the peasants, who were now able to enjoy the sweets of industry, and certainly every thing that had been fairly tried had fairly succeeded.

It was again a fine sunny Sunday evening; and a young woman, after decking a grave in the old park churchyard with the sweet tribute of flowers, and having said the necessary number of prayers, was sitting upon the green mound, her head rested against the grey gravestone, and her tearful eyes were bent upon the simple inscription and rude cross engraved thereon.

"I have tried him, that is, he has tried me, mother dear," she said, holding that soothing though imaginary converse with the dead, which is so sweet a consolation to the living. "I have tried to see what he was made of, and sure he's mighty like the rest of the boys, only may be better, and turned to your heart's content to the improvements; and sure I thought the heart would burst in my bosom when my mistress asked me only on Thursday last if I had any thoughts of marrying; for if I had, there was a new house ready for me."

"And what did you answer, Anty?" inquired a voice seldom heard, but well remembered.

Abel and Anty did not separate that night in anger; they knelt together, and exchanged promises, and walked lovingly by the mill-pond stream towards the domain.

"I'd rather," said the lover, as, after much explanation and love-talk, they paused to look at the noble pile to which wings and towers in admirable taste have been added; "I'd rather that castle was on the top of the Mountain of Forth, as an example to the country, than sink down in a valley."

"Sure it is as well where it is; has as fine a moral influence—the people, I mean, that's in it," answered Anty, who, with all her goodness, if she had been "a lady," was fond enough of hard words to merit the distinction of a "blue stocking."

"MORAL INFLUENCE!" repeated Abel; "I dare say that's the right sort of thing; but I'd have the advantage of every sort of influence given to such people. The castle, I tell you, should be on the top of the mountain in its glory."

"The glory of their good deeds will go higher than that," said Anty.

"I know—to heaven!" replied the young man.

"But, for all that, I'd have him a lord on earth."

"They'll be saints in heaven," said the girl.

"I tell you, Anty, *avoureen*, I know nothing can make them holier nor happier, barring it was seeing the whole country as prosperous as their own estates; but for the sake of the example, you know—the example, don't you see?"

"The example—that converted you; it wasn't love of me you know, Aby—there's Judy —"

"Now hush, Anty! By the powers, I'll go to the priest to-night to get the blessed words said at once; I've passed my vocation, and —"

"You ought to go the first six months over again; you behaved badly at first, Abel."

"Ah, whisht, *cora machree*! sure I knew the obstinacy was in you, and that you would not give in. Now, Anty, I see the good of every thing you used to say; and if you'll only, in a humble way, take pattern of the mistress —"

"Oh, Abel! but I'll try, in a humble way, as the wren said, when she tried to fly after the eagle, if you will take pattern by the 'Landlord at Home.'"

Note.

It has been often and truly said, that the best feelings are the most difficult to express, and I believe I must confess myself more at home with fiction than with facts: perhaps this is the reason why these stories have cost me more time and more anxiety than all my others put together. The cause has kept my heart beating as long as the pen was in my hand. In this story I have failed the most; failed to express the deep and earnest sense I entertain of my friends' virtues—failed to depict their usefulness—failed to do justice to their *practical patriotism*. I would, with Abel, that they enjoyed all earthly distinction, not because it would gratify them—they are above such wants and wishes—but because of the example which, the more it is known, the more it will be imitated. In the story I refrained from mentioning their name, lest I should wound that sensitive delicacy which confines them almost too closely within their own domain; but I saw only this morning that other travellers have named Mr and Mrs Grogan Morgan as examples of all that could be desired in *landlords at home*. I have often looked on the grim old portrait of one of their ancestors, and could almost fancy the stern features smiled in approbation of their good deeds. Hamilton Knox Grogan Morgan is a lineal descendant of the great Scottish Reformer.

A. M. H.

MR. A. FORBES'S NEW WORK ON THE CALIFORNIAS.

At a time when all the more recently discovered portions of the globe are attracting the deepest attention in Britain and other countries of the Old World which require free outlets for their redundant population, the Californias, or California, an extensive region on the Pacific shores of North America, appears not undeserving of a share of notice from the patrons of emigration and enterprise. The Californias, as the country is usually termed, from its internal division into Upper and Lower California, have hitherto been but imperfectly known in Britain, but ample information on the subject has recently been supplied by a work from the pen of Alexander Forbes, Esq., a gentleman who has obviously enjoyed the most liberal opportunities of acquiring a knowledge of the matters of which he treats.* Being still abroad, or having been so recently at least, the author has had the assistance of his brother, Dr John Forbes, in putting the work into a fitting shape for publication, and to the same editor's care the volume is indebted for some additions that increase its value and completeness.

The name of California was originally given to a tract of country extremely well marked in its boundaries by nature. It consisted of a long, narrow, peninsular neck of land, running parallel with the North American mainland, and separated from it by a narrow gulf, which received the name of the Gulf of California. At the top or northern extremity of the gulf, the neck of land is united to the continent. When an additional tract of country came to be included under the same general name, the title of Old or Lower California was given to the territory described. New or Upper California is continuous with, and stretches northwards from, the Lower country, to which it bears

precisely the same relation, in point of position, that the wide part of a funnel does to the narrow neck or pipe; that is to say, from the point where the peninsula joins the mainland, the Californias extend their bounds, and embrace a large part of the coast and continent. The whole of the Californias, thus shaped, lie between 23 and 32 degrees of north latitude. The Pacific Ocean is the boundary of the whole on the west, the Gulf of California and the Mexican or Indian territory on the east, and on the north the natives or Indians occupy the boundary lands.

Mr Forbes devotes much, perhaps too much, of his work to an account of the discovery, early history, and colonisation of these countries. It is sufficient here to say, that a squadron sent out by Cortes in 1534, discovered Lower California, and that about thirty years afterwards the coast of Upper California was explored also by the Spaniards. The two regions became nominally provinces of Mexico, and numerous expeditions were fitted out by the Mexicans to colonise Lower California, and to procure from it some of the gold and pearls in which its coasts were believed to abound. But all these expeditions failed in their object; not through the opposition of the natives, but through the insuperable barrenness of the country, which would not sustain settlers, at least at the outset. It was only in the beginning of the eighteenth century that the peninsula was really colonised, and on that occasion the feat was accomplished by a body of Jesuit friars, who established various missions in the country, converted and baptised the natives, got the whole of the lands under their management, and became rulers of all, secularly as well as religiously. The Jesuits were expelled in 1767, but other friars succeeded them, and the system they established remains in full force up to this hour. In like manner, so late as the year 1768, Upper California was colonised by missionary priests, and the same system established there.

So much for the general history of the Californias, and for the circumstances which have made them what they are. Mr Forbes gives but a limited space in his pages to Lower California, admitting it to be a land afflicted with "indomitable barrenness," and to have scarcely a redeeming point about it but its pearl fisheries. Even these fisheries, when the experiment was tried under the very ablest management, and with the advantage of a diving-bell and apparatus of the most perfect kind, proved aught but a profitable concern to the London Company which in 1825 laid out large sums on an attempt to fish the gulf. Upper California, however, is a country of a totally different natural character. It is much larger than Old California, "presenting a superficies equal to many of the most extensive and powerful kingdoms of Europe. That part of it which is at present occupied by the missions and settlers, is about five hundred miles in length, and the breadth from the sea to the first range of hills may be stated at an average of forty miles, which will give an area of twenty thousand square miles, and about thirteen millions of English statute acres." The surface of the country is very generally diversified by hill and plain, covered in parts by fine old forest oaks and other kinds of woods, and the soil is in some places of a light sandy character, yet far from sterile; in others, of the richest loam. All travellers in this country have been struck with its fertility and beauty, but especially with its fertility. Vancouver was alike struck with the quality, quantity, and variety of its vegetable productions, including "apples, pears, plums, figs, oranges, grapes, peaches, and pomegranates, together with the plantain, banana, cocoa-nut, sugar-cane, indigo, and a great variety of the necessary and useful kitchen herbs, plants, and roots." In addition to these valuable recommendations, Upper California, having its situation between the tropical and northern zones, possesses one of those temperatures removed from extremes, such as mankind have always found most suitable and agreeable. Streams and springs are not sufficiently abundant, but, by digging, water can be got in most places. The farther from the Pacific, the finer the land and its capabilities are said to become.

This rich country, capable (among other advantages) of becoming, Mr Forbes thinks, one of the most productive of wine-countries, is at present inhabited, at least towards the coast, by missionaries, by a scanty Creele or Spanish population, and by converted Indians (mixed and unmixed), to the very small number, in all, of 23,000 persons. Of these, the proportion of the Indian population amounts to above 18,600. The whole population are in a measure dependent upon,

* California: a History of Upper and Lower California, &c. By Alexander Forbes, Esq. London, Smith, Elder, and Co.

and reside in and around, the mission-stations, with the exception, only, of those dwelling at three towns or villages, which exist independently of the missions, and which owe their origin to old soldiers retired from service with grants of land. Besides these free towns, there are four forts or *Presidios*, placed along the coast, and dividing the country ostensibly into so many military districts, though the force at these forts has ever been contemptible, and though all the use the soldiers ever were put to, was to pursue and to bring back to the missions such of the Indians as chose to run away after conversion. The missions, and the missions alone, have all the good and evil of this country at their door, to use a familiar expression. They are now twenty-one in number (says Mr Forbes, whose statements we are at present following, though our space, unfortunately, will not permit of the use of his own words), and about 19,000 of the whole population are connected with them. These missions being all on the same plan, a description of one of them will give a complete idea of the whole social economy of California.

The average number of residents at each mission amounts to about 900 persons, consisting of a few Franciscan friars, several Creole families, and Indians. Sometimes the houses of the missions are in regular rows, and built of brick, but, generally, the majority of the population, or Indians, live in rude huts of their own making, constructed of rough poles, set up in a conical form, and covered with dry grass. To each mission, a tract of land, of about fifteen miles square, is attached for the purposes of husbandry, and there are granaries and store-houses at the mission for the reception of the produce. "The church (says Mr Forbes) is of course the main object of attraction at all the missions, and is often gaudily decorated. In some of the missions where there is good building-stone in the vicinity, the external appearance of the sacred building is not unseemly: in other missions the exterior is very rude. In all of them the interior is richer than the outside promises." The character of the race for whose ostensible benefit these missions were established, has not yet been adverted to, but a few words may fill up the deficiency. The Californian Indians have ever shown themselves to be a weak race, physically as well as mentally, low in the scale of being and civilisation, unconquerably slothful and filthy, and, in short, a people as different from the Red men of the opposite coast, as one race can be from another. Captain Beechey thus describes the first instruction of a band of natives by a blind Indian, chosen for the task. The tutor made his blanketed pupils kneel, and told them to repeat each word he said. "The speaker then began: 'Santissima Trinidad, Dios, Jesu Christo, Espiritu Santo'—pausing between each name, to listen if the simple Indians, who had never spoken a Spanish word before, pronounced it correctly, or any thing near the mark. When they had repeated these names satisfactorily, their blind tutor, after a pause, added 'Santos'—and recapitulated the names of a great many saints, which finished the morning's tuition."

To the end, these poor beings may be said to know nothing more of their new faith than a few names and forms, and even these are with them things of rote. As for any change in their moral nature, that is out of the question. But, once baptised, they have an undefined impression that a spell has been laid upon them, and that it would be fatal to retract or fly; and, moreover, to speak the truth, the life which they lead at the missions suits their lazy habits but too well. The course of life at the missions is thus described. "The Indians, as well as the missionaries, rise with the sun and go to mass. While this is in progress, the breakfast is prepared, the favourite *atole* or pottage, which consists of barley-flour, the grain being roasted previously to grinding. It is cooked in large kettles, and every cottage sends for the allowance for all its inmates, which is carried home in one of the bark baskets. Any overplus that remains is distributed among the children, as a reward for good behaviour, particularly for good lessons in the catechism [in which all education lies, or nearly so]. After breakfast, which lasts about three-quarters of an hour, they proceed to their labours, either out of doors or within. At noon the dinner is announced by a bell, and the Indians, quitting their work, go and receive their rations as at breakfast-time. The mess now served is somewhat of the same kind as the former, only varied by the addition of maize, peas, and beans; it is named *pozzioli*. After dinner they return to their work, from two to four or five; afterwards they attend evening mass, which lasts nearly an hour, and the day is finished by another supply of *atole*, as at breakfast." Agricultural labours, in-doors and out-of-doors, wool-combing, manufacturing a coarse clothing for the Indians, carpentry-work, and other employments in rude forms, are those which occupy the natives. "All the girls and widows are kept in separate houses during the day while at work, being only permitted to go out occasionally, like boys at school. The unmarried of both sexes, *adults* as well as children, are carefully *locked up* at night in separate houses, the keys being left in the keeping of the Fathers; and when any breach of this rule is detected, the culprits of both sexes are severely punished by whipping, the men in public, the women privately."

Alluding to these restraints, and to the severe penalties attending any attempt to escape, Mr Forbes says, "it is obvious from all this, that these poor people are in fact slaves under another name," and

that "the mission system tends most powerfully to keep up and to aggravate the natural defects in their character, and to frustrate all prospect of true civilisation, and all rational improvement." Mr Forbes's further observations on this subject, at the close of his chapter on Missionary Establishments, are convincing, and well worthy of an attentive perusal.

Hides and tallow are the principal articles of export, though the country might richly supply a thousand others. But the system of pasturage is one productive of the least possible toil to man, and of course it is here the favourite system. Much might be made, nevertheless, out of a trade even in the two articles mentioned, as, in 1831, Upper California contained, exclusive of animals running wild, 216,727 black cattle, 32,201 horses, 153,455 sheep, with inferior quantities of goats, mules, asses, and swine. Wheat, also, of which the country produced 7557½ quarters in the same year, is also, to a very small extent, an article of export. Barley, maize, beans, and peas, are also cultivated over the land. Such are the sources of income in Upper California, but how miserably limited and scanty these are, according to our author's clear statements, in comparison of the sources that might be drawn upon! Wine, brandy, olives, hemp, flax, with a numerous train of valuable vegetables which have been proved to be most congenial to the soil, and all the manufactures for which the herds of domestic cattle present the material, might be forthcoming at the will of man. Nature has done her part, and man's care and skill are alone wanting. And how lamentably these are wanting in the present state of things, may be still more forcibly shown by a single anecdote. *Sea-otters*, creatures with most valuable skins, abound on the coasts, and in the rivers of Upper California, and at one time the Indians, when unmissionised, hunted these creatures actively. Even in the time of Perouse, ten thousand skins were got in a year at one port, Monterey. But growing indolence had in 1824 reduced the whole national produce in this article to two thousand skins, and Captain Beechey relates that, at the same period, when he visited the country, "the inhabitants were actually buying other skins of the Russians at twenty dollars a-piece, while the animals were swimming about unmolested in their own harbours!" Beavers, also, are numerous in California, and might be the source of much revenue. The interior lands contain, also, many wild animals, among which the lion, tiger, and bear, are the most formidable, though they do not seem to be so numerous as to molest the wild Indian tribes. Buffaloes, stags, roes, foxes, hares, rabbits, wild-cats, &c., are likewise found. The coasts and rivers swarm with varieties of fish.

We have been thus particular in describing this country and its capabilities, for various reasons. The simple communication of novel information, a motive always in operation with us, and which Mr Forbes's book has fortunately turned up to gratify, is one reason; but a more particular one rests on the fact, that "there have been some thoughts of proposing to the Mexican government that it should endeavour to cancel its debt to England—which now exceeds fifty millions of dollars—by transferring California to the creditors." It is true, that, in 1836, the inhabitants of Upper California rose in arms, put down the Mexican soldiery in the presidios or forts, and declared the country independent. Mexico stormed and threatened great things, but the matter ended in smoke, and California has ever since gone on as it pleased. In reality, it cannot be said to have a government at all, and, from the mission system, where each village is an independent place, it does as well without as with one. But, in spite of this seeming emancipation, the transfer by Mexico to such a power as Britain would be alike unopposed and unopposable, unless some point of etiquette with regard to Old Spain stood in the way. Such a transfer, however, at this time of day, is not likely to take place after all, although hard cash might be considered by all men a fair enough equivalent, and although nothing but good would probably follow to the Californians. But Russia, which has a settlement (Bodega) in dangerous proximity to California, and the United States, whose mighty tide of population is perpetually rolling inward and southward, may not be so scrupulous, and may take the land without any trouble about transfers. These are Mr Forbes's sentiments, and he seems to think that such a sovereignty as that of the East India Company in Hindostan, might be established in California with the highest prospect of good to all parties. Were this to take place, the country would indeed become an object of deep interest to Britain and its shifting population. But there are circumstances, independently of this purchase, and the considerations attached to it, which render California worthy of serious attention at the present time. If the proposed railroad be carried across the Isthmus of Panama, and steam navigation be established on the Pacific coasts of the Americas, California will come in for its share in the new commercial enterprises that must result therefrom, and British mercantile settlements may dispel the deep lethargy in which it at present rests. Fortunately, there are good harbours on the Californian coasts, and Captain John Hall describes that of San Francisco, in particular, as being "one of the best and most interesting in the world, from its security and magnificence." Those of San Pedro, Santa Barbara, San Juan, and San Diego, are also good.

Such are the natural characteristics, and such the

natural capabilities, of a country which circumstances may yet make of importance to British commerce and enterprise. We gladly recommend the work of Mr Forbes to our readers, as presenting a most complete view of the subject under the author's consideration. Nor would it be just to omit notice of the Appendix, where the editor has introduced some interesting papers regarding the Californian harbours and steam navigation in the Pacific.

OCCASIONAL NOTES. NEWSPAPERS.

In every newspaper, weekly, daily, or of whatever period, there are two or three columns at the end, devoted to matters so completely destitute of general interest, that many persons, we seriously believe, who have been in the way of reading the news all their days, never once looked attentively at a single line of that portion of any one sheet that ever came into their hands. If any gentleman, struck by a momentary feeling of curiosity, were to cast his eyes to this quarter of any particular print which he might chance to be reading, just to learn what kind of stuff it is, in such small type and of such intensely arithmetical aspect, which is always put into these last columns, and which he has so long contrived to avoid even glancing at, he would discover that the matter in question consists of a great variety of short and crabbed allusions to vessels seen in the Cattegat—to the prices of barley and beans—to the briskness of cotton and the flatness of flax—to the deadness of heifers in Smithfield, and the vivacity of pearl-shells at Quebec—and to many other things expressed in a most mysterious way, as "Riga P.T.R. 45.10.46.0," and "Lard. firk. 62.0. a.66.0." There are people writing in a most decisive way from Archangel about tallow, and gentlemen of Jamaica as much as saying that it is all up with sugar for the ensuing season, not only in that island, but also in Trinidad. Of course there must be parties, such as merchants and farmers, to whom these matters are interesting; but the number of such persons must be small. To the great bulk of the public, who purchase or look into newspapers solely for general information, the intrusion of such special kinds of intelligence, designed only for some one-hundredth part of the community, is a piece of impertinence. It is making the mass pay for what only the few want, and taking up room which might be filled with much greater satisfaction to the many. Let the people, we say, who wish to know about the state of markets and the sailing of vessels, have their own papers filled with those matters alone; but do not let every body's newspaper be crowded with what only one or two in a thousand care for. All that families, and the public at large, wish for in the form of prices current, are the weekly charges for bread, flour, coal, butcher meat, &c., by retail; because these they can understand and apply to their own particular cases; yet, strange to say, these they rarely obtain on a methodic comprehensive plan in the newspapers.

The heaviest item, however, of cumbersome matter in most newspapers, is the advertisements. It is not unusual to find two out of four pages of a newspaper filled with advertisements, one-third of which consists of announcements of quack medicines. Striking off, therefore, two pages for advertisements, and half a page for market tables, we have only a page and a half of readable matter, and sometimes the quantity is much less. Now, we take leave to say that this is too bad. Advertisements are very well in their way, and often serve a useful purpose, but the cost of their circulation ought in fairness to be borne by those who seek to profit by them, not by those who buy papers for the sake of general intelligence. Newspaper proprietors seem to be of a different opinion; at least they always seem more anxious to make their papers pay by means of an increase of advertisements, than by an extended circulation through literary merits. We should like to see a newspaper attempt to support itself solely by that for which it is bought by its customers, namely, general public intelligence. Such a paper, if started in a proper field of publication, and otherwise well conducted, could scarcely, we think, fail to secure a large share of success.

It is unnecessary to point out the impropriety of admitting quack-medicine advertisements on any terms into the columns of a newspaper, for on that point the public are long ago agreed, and the continuance of the practice (let it be abolished by general consent) reflects extremely little credit on the taste or moral feelings of the publishers. Scarcely less objectionable is the too frequent practice of admitting paid puffs of articles of merchandise. As regards puffs of books—generally

trashy novels—this practice has become a vile blot on the face of some of our otherwise most respectable newspapers, and for the sake of common honesty should be relinquished. Being calculated to mislead—indeed the design is to deceive—it is paltry in the extreme, and admits of no species of excuse.

In North America, where the press is less hampered by fiscal regulations, and where there is a more venturesome originality than with us, there are many newspapers and periodicals devoted to distinct sections or orders of persons, and also to the discussion of particular questions. Thus, there are papers for clergymen, papers for schoolmasters, papers for men of science, papers for merchants, papers for lawyers, papers for agriculturists, &c., together with hosts of papers of a miscellaneous character. Latterly, we have seen symptoms of this kind of division of labour in the English metropolitan press, which now affords distinct newspapers on military and naval subjects (*Naval & Military Gazette*), on gardening, on farming, on railroads, and some other topics. This is a signal improvement in the ordinary mode of conducting newspapers, to which it is gratifying to advert. But the field is large, and much remains to be done. If publishers, instead of wasting their energies in imitations, would cast about in their minds, they might with little difficulty perceive that there are important sections of people, and also particular professions, who have as yet no regular channels of peculiar intelligence, and have to depend entirely upon chance for information deeply affecting their interests. Perhaps these rough hints may be of use in stirring the inventive faculties of our friends in the publishing world.

GOLFING—THE COCK OF THE GREEN.

AMONGST the grotesque portraits engraved by John Kay of Edinburgh, there was one entitled "The Cock o' the Green," representing an old man, whose real name was Alexander McKellar, engaged in playing at golf on Burntsfield Links, in the neighbourhood of the Scottish capital. In the curious and amusing work in which Kay's engravings have been republished with illustrative letter-press,* we find a learned and at the same time droll account of the game of Golf, introductory to an equally whimsical notice of the said Alexander McKellar. The article is here, with the obliging concurrence of the publisher, presented in a somewhat abridged form:—

The game of golf (*Scottice, goff*), is a pastime,† although not entirely unknown in England, more peculiar to Scotland, and has long been a favourite with the citizens of Edinburgh. In the Teutonic, or German, *kolbe* signifies a club; and, in Holland, the same word, pronounced *kolf*, describes a game—of which the Dutch are very fond—in some respects akin to the Scottish pastime of golf.

At what period this amusement came to be practised in Scotland, is not precisely known; but from the circumstance of *foot-ball* being prohibited by a statute in 1424, in which no mention is made of *golf*, while it is specially noticed in a later enactment, 1457, the presumption is, that the game was unknown at the former period, and, consequently, that its introduction must have been about the middle of the fifteenth century.

Early in the reign of James VI. the business of club-making had become one of some importance. By "ane letter" of his majesty, dated Holyrood House, 4th April 1603, "William Mayne, bower, burgess of Edinburgh," is made and constituted, "during all the days of his lyf-time, master fledger, bower, club-maker, and speir-maker, to his Hieness, alsweill for game as for air," and in 1618 the game of golf appears to have been so generally in practice, that the manufacturing of balls was deemed worthy of special protection.

From this period the game of golf took firm hold as one of the national pastimes, practised by all ranks of the people, and occasionally countenanced by royalty itself. "Even kings themselves," says a writer in the *Scots Magazine* for 1792, "did not decline the princely sport; and it will not be displeasing to the Society of Edinburgh Golfers to be informed that the two last crowned heads that ever visited this country, used to practise the golf in the Links of Leith, now occupied by the society for the same purpose.

"King Charles I. was extremely fond of this exercise; and it is said that when he was engaged in a party at golf on the Links of Leith, a letter was delivered into his hands, which gave him the first account of the insurrection and rebellion in Ireland; on reading which, he suddenly called for his coach, and leaning on one of his attendants, and in great agitation, drove to the Palace of Holyrood House, from whence next day he set out for London."

"The Duke of York, afterwards James II., was not less attached to this elegant diversion. In the years 1681 and 1682, being then Commissioner from the King to Parliament, while the duke resided at Edinburgh, with his duchess, and his daughter the Princess Anne (afterwards queen), a splendid court was kept at the

Palace of Holyrood House, to which the principal nobility and gentry resorted. The duke, though a bigot in his principles, was no cynic in his manners and pleasures. At that time he seemed to have studied to make himself popular among all ranks of men. Balls, plays, masquerades, &c., were introduced for the entertainment of both sexes; and tea, for the first time heard of in Scotland, was given as a treat by the princesses to the Scottish ladies who visited at the Abbey. The duke, however, did not confine himself merely to diversions within doors. He was frequently seen in a party at golf on the Links of Leith, with some of the nobility and gentry. "I remember," says Mr Tytler of Woodhouselee, "in my youth to have often conversed with an old man, named Andrew Dickson, a golf club-maker, who said that, when a boy, he used to carry the duke's golf-clubs, and to run before him and announce where the balls fell." Dickson was then performing the duty of what is now commonly called a *fore-caddie*."

At this time Burntsfield Links, now a much frequented field, does not seem to have been used for golfing. It formed part of the Burrowmuir, and perhaps had not been cleared. The usual places of recreation were Leith and Musselburgh Links—the former more especially of the Edinburgh golfers. In a poem entitled "The Goff" (by Thomas Mathison, at one period a writer in Edinburgh, but subsequently minister of Brechin), first published in 1743, and again by Mr Peter Hill in 1793, the locality is thus alluded to:—

North from Edina, eight furlongs and more,
Lies that famed field on Forth's sounding shore;
Here Caledonian chiefs for health resort—
Confirm their sinews by the manly sport.

The author then goes on, in a lively strain, to describe some of the "chiefs"—the "cocks o' the green" at that period:—

Macdonald and unmatched Dalrymple ply
Their ponderous weapons, and the green defy:
Rattray for skill, and Corse for strength renowned,
Stewart and Lesly beat the sandy ground;
And Brown and Alston, chiefs well known in fame,
And numbers more the muse forbears to name.
Gigantic Biggar here full oft is seen,
Like huge Behemoth on an Indian green;
His bulk enormous scarce can 'scape the eyes;
Amazed spectators wonder how he plies.
Yea, here great Forbes,* patron of the just—
The dread of villains, and the good man's trust;
When spent with toils in serving human kind,
His body recreates and unbends his mind.

The oldest golfing associations, or clubs, are the "Edinburgh Burgess" and "Burntsfield Links" Golfing Societies, instituted in 1735. The "Edinburgh Company of Golfers," under the patronage of the city, originated in 1744. An act was passed by the Town Council, on the 7th of March, "appointing their treasurer to cause make a silver club, of L.15 value, to be played for on the Links of Leith, the first Monday of April annually. Except in the years 1746 and 1747, the club was regularly played for; and as a further encouragement, the society themselves gave two annual prizes—the one, a silver cup, value ten guineas, on which were engraved the winner's name and coat-of-arms, with a suitable inscription. The other prize was a gold medal, given to the best player at golf, and worn on the breast of the conqueror for a year, and as many years after as he might be able to maintain his superiority.

In 1768, about twenty-two members of the society having subscribed L.30 each, they built what is called the "Goff-House," at the south-west corner of Leith Links, wherein the company might hold their meetings, social as well as connected with business. The company not being a corporate body, this property, feued from the city of Edinburgh, was "vested in Mr St Clair of Roslin, Mr Keith of Ravelston, and Mr W. Hogg, junior, banker, for behoof of the whole subscribers."

In 1800, the "Honourable Company of Golfers" was incorporated by a charter from the magistrates; and for more than twenty years afterwards, the meetings of the club—which could boast of the most illustrious Scotsmen of the day amongst its members—continued to be regularly held at Leith. Latterly, some alterations having been made on the Links, and the play-ground ceasing to be attractive, the stated meetings of the club were given up about seven years ago; and it was ultimately deemed advisable, or rather became necessary, from the state of the funds, to dispose of the Goff-House and furniture. This was accordingly done; and it is much to be regretted that various pictures of old members, and other articles, connected, it may be said, with the history of the club, were not reserved. These were sold for trifling sums, and, in many instances, to parties unconnected with the society, from whom they cannot now be repurchased. About three years ago, however, through the activity of some of the old members, the stated meetings were revived on Musselburgh Links; and a great accession of young members having taken place, the Edinburgh Golfing Company is once more in a flourishing condition.

The Links, or Commons, being free to all, there are innumerable players unconnected with any of the golfing societies, and many who resort to Burntsfield Links occasionally for amusement and exercise, are accom-

modated with the loan of clubs by the maker, for a trifling remuneration.

The handle of the bat or club is straight, generally about four feet and a half in length, and usually made of ash, or hickory, which is allowed to be better. The curvature, made of thorn, is affixed to the bottom, faced with horn, and backed with lead:—

Forth rush'd Castalia, and his daring foe,
Both arm'd with clubs, and eager for the blow.
Of finest ash Castalia's shaft was made;
Pond'rous with lead, and fac'd with horn the head;
The work of Dickson, who in Letha dwells,
And in the art of making clubs excels.

The ball is a little one, but exceedingly hard, being made of leather, and stuffed with feathers. There are generally two players, who have each of them his club and ball.* The game consists in driving the ball into certain holes made in the ground, and he who achieves this in the fewest strokes, obtains the victory. The golf lengths, or the spaces between the first and last holes, are sometimes extended—where the ground will permit, such as at St Andrew's—to the distance of two or three miles; the number of intervening holes appears to be optional, but the balls must be struck into the holes, and not beyond them: when four persons play, two of them are sometimes partners, and have but one ball, which they strike alternately.

It is no unusual thing for a player to have along with him eight or ten clubs, of different forms, adapted for striking the ball in whatever position it may be placed.† These are usually carried by a boy denominated a *caddie*; and the players are generally preceded by a runner, or *fore-caddie*, to observe the ball, so that no time may be lost in discovering it. Bets of a novel nature, which set the ordinary routine of the game entirely aside, are occasionally undertaken by the more athletic. An amusing and difficult feat, sometimes attempted from Burntsfield Links, is that of driving the ball to the top of Arthur's Seat! In this fatiguing undertaking, being a species of steeple chase, over hedges and ditches, the parties are usually followed by bottle-holders and other attendants, denoting the excessive exertion required.

When confined to its proper limits, the game of golf is one of moderate exercise, and excellently calculated for healthful recreation. In the west of Scotland it is comparatively unknown. One cause for this may be the want of commons, or links, sufficiently large for the pastime to be pursued to advantage. In Glasgow, a golf club was formed some time ago; but we understand the members were under the necessity of breaking up, in consequence of having been prohibited the use of the green, part of which is preserved with great care for the purposes of bleaching. In Stirling two or three golfers may occasionally be seen playing in the King's Park, but the game has evidently ceased to be popular there. An attempt was recently, very injudiciously, made to stop the players by the tacksman, but ineffectually. About Edinburgh, Musselburgh, Perth, St Andrew's, and other districts, where no restraints exist, golf maintains a decided superiority, and seems at the present time to be followed with new spirit. Indeed, the game was never more popular. In addition to the old clubs in the districts already mentioned, another has been recently established at New Berwick, the meetings of which are numerous attended. St Andrew's, however, has been denominated the *Doncaster* of golfing. A great many of the nobility and gentry of the neighbouring counties are members of the club, which bears the name of the tutelary saint, and the autumn meeting may be said to continue for a week, during which the crack players from all quarters of the country have an opportunity of pitting their strength and skill against each other. On these occasions, the Links, crowded with players and spectators, present a gay and animated scene. Two medals are played for—the one belonging to the club, and the other a recent gift of King William IV., which was competed for at last meeting (1837) for the first time, and attracted a very great assemblage of the best golfers. At the ordinaries in the evening, the parties "fight their battles o'er again," and new matches are entered into. The day on which the king's medal was played for, terminated with a ball, given by the club, which was numerous and fashionably attended. In London, a society of golfers still exists, principally composed, we believe, of Scotsmen, called the "Blackheath Golf Club," which was established prior to the year 1745.

ALEXANDER M'KELLAR, the "Cock o' the Green"—whom the print represents as about to strike the ball—was probably one of the most enthusiastic golf-players that ever handled a club. When the weather would at all permit, he generally spent the whole day on Burntsfield Links, and he was frequently to be found engaged at the "short-holes" by lamp-light. Even in winter, if the snow was sufficiently frozen, he might be seen enjoying his favourite exercise alone, or with any one he could persuade to join him in the pastime.‡ M'Kellar thus became well known in the neighbourhood of the green, and his almost insane devotion to golf was a matter of much amusement to his acquaintances. So

* It is almost indispensable for a player to have at least two clubs, a long one for driving, and a short one for putting near the hole; and on Links such as St Andrew's, where there are many sand-holes, or bunkers, as they are termed, a club with an iron head (differing in form from the heads of the wooden clubs) is required. Of these iron clubs there are various kinds, adapted to the different situations of the green.

† By the rules of the game (with certain exceptions) the ball must be struck where it lies.

‡ When snow happens to be on the ground, a red ball is used.

* Two volumes, quarto. Henry Paton, Edinburgh, 1838.

† A description of the implements—club and ball—used in golf, will be found in the middle of the article.—*Ed. C. E. J.*

* Duncan Forbes, Esq., Lord President of the Court of Session. It is reported of this great man that he was so fond of golf as to play on the sands of Leith when the Links were covered with snow.

thoroughly did he enter into the spirit of the game, that every other consideration seemed obliterated for the time. When victory chanced to crown his exertions, he used to give way to his joy for a second or two by dancing round the golf hole. M'Kellar, however, was not a member of any of the clubs; and, notwithstanding his incessant practice, he was by no means considered a dexterous player. This is accounted for by the circumstance of his having been far advanced in years before he had an opportunity of gaining a knowledge of the game. The greater part of his life had been passed as a butler, but in what family is unknown, nor indeed does it matter much. He had contrived to save a little money; and his wife, on their coming to Edinburgh, opened a small tavern in the New Town. M'Kellar had thus ample leisure for the indulgence of his fancy, without greatly abridging his income, and golf may be said to have virtually become his occupation; yet no perseverance could entirely compensate for the want of practice in his younger years.

His all-absorbing predilection for golf was a source of much vexation to his partner in life, on whom devolved the whole duty of attending to the affairs of the tavern. It was not because she regretted his want of attention to business, for probably he would have been allowed to appropriate a very small portion of authority in matters which she could attend to much better herself, but she felt scandalised at the notoriety he had acquired, and was not altogether satisfied with the occasional outlay to which he was subjected, though he never speculated to any great amount.

No sooner was breakfast over than M'Kellar daily set off to the green, and ten to one he did not find his way home until dusk; and not even then, if the sport chanced to be good. As a practical jest on the folly of his procedure, it occurred to his "better half" that she would one day put him to the blush, by carrying his dinner, along with his nightcap, to the Links. At the moment of her arrival, M'Kellar happened to be hotly engaged; and, apparently, without feeling the weight of the satire, he good-naturedly observed, that she might wait, if she chose, till the game was decided, for at present he had no time for dinner!

So provoked at length was the good dame, that she abhorred the very name of golf, as well as all who practised it; and to her customers, if they were her husband's associates on the green, even a regard for her own interest could scarcely induce her to extend to them the common civilities of the tavern.

What betwixt respect for his wife, and his fondness of golf, M'Kellar must have been placed in a rather delicate situation; but great as the struggle might be, all opposition was eventually overcome, and he determined to enjoy his game, and be happy in spite of frowns, lectures, or entreaties. One thing alone annoyed him, and that was the little countenance he was enabled to give his friends when they happened to visit him. At length an opportunity occurred, apparently highly favourable for an honourable *amende* to his long-neglected acquaintances. Having resolved on a trip to the kingdom of Fife, where she calculated on remaining for at least one night, his "worthy rib" took her departure, leaving him for once, after many cautions, with the management of affairs in her absence. Now was the time, thought M'Kellar. A select party of friends were invited to his house in the evening: the hour had arrived, and the company were assembled in the best parlour—golf the theme, and deep the libations—when (alas! what short-sighted mortals are we!) who should appear to mar the mirth of the revellers, but the golf-hating Mrs M'Kellar herself! Both winds and waves had conspired to interrupt the festivity; the ferry had been found impassable, and the hostess was compelled to return. What ensued may be imagined. The contemplated journey was postponed *sine die*; and M'Kellar internally resolved to make sure, before giving a second invitation, that his spouse had actually crossed the ferry!

Happening to be at Leith one day, where his fame as a golfer was not unknown, M'Kellar got into conversation, in the club-maker's shop, with a number of glass-blowers, who were blowing very much about their science in the game of golf. After bantering him for some time to engage in a trial of skill, a young man from Burntsfield Links opportunely made his appearance. "By gracious, gentlemen!" exclaimed M'Kellar, whose spirit was roused, "here's a boy and I will play you for a guinea!" No sooner said than a match of three games was begun, in all of which the glass-blowers were defeated. The "Cock o' the Green" was triumphant; and, not waiting till the bet had been forthcoming, he ran to the shop of the club-maker, announcing the joyful intelligence—"By gracious, gentlemen, the old man and the boy have beat them off the green!"

By way of occupying his time profitably on the *seventh*—the only day in the week he could think of employing otherwise than in his favourite amusement—M'Kellar was in the habit of acting as door-keeper to an Episcopal chapel. On entering one day, old Mr Douglas Gourlay, club and ball maker at Burntsfield, jocularly placed a golf ball in the plate, in lieu of his usual donation of coppers. As anticipated, the prize was instantaneously secured by M'Kellar, who was not more astonished than gratified by the novelty of the deposit.

It was at the suggestion of the late Mr M'Ewan and Mr Gourlay that Kay produced the etching of the "Cock o' the Green." Going out purposely to the Links, the artist found him engaged at his usual pastime, and succeeded in taking an accurate and characteristic likeness. When informed what Kay had been doing,

M'Kellar seemed highly pleased. "What a pity," said he; "by gracious, had I known, I would have shown him some of my capers!"

In 1803, although pretty far advanced in life, M'Kellar continued to maintain his title of the "Cock o' the Green" for a considerable time. He died about twenty-five years ago.

SKETCHES IN NATURAL HISTORY.

CATTLE, TAME AND WILD.

SECOND ARTICLE.

AN extraordinary degree of attention has lately been directed to what are called the WILD CATTLE of Britain. During the past session, 1837-8, a paper was read upon the wild ox of Scotland, to the Royal Society of Edinburgh, by a celebrated anatomist, which was printed in the Quarterly Journal of Agriculture of the Highland Society of Scotland, for the month of December last; and another communication on the same subject appeared in the last number (March 1839) of the same periodical, from the pen of Mr Patrick, a clergyman resident at Hamilton. At the last meeting of the British Scientific Association, again, Mr Hindmarsh read a communication "On the Wild Cattle of Chillingham Park," including an account of these animals drawn up by their present proprietor, the Earl of Tankerville, which communication has been published in a late number (December 1838) of the "Annals of Natural History," and was ably noticed in our valuable contemporaries the *Athenæum* and *Penny Magazine*: whilst the recent works on this fascinating study—Mr Bell in his "British Quadrupeds," the *Naturalist's Library* on the "Ruminants," and Mr Swainson in *Lardner's Cyclopædia* (vol. 72), not to name other and older works, have given them a marked and ample consideration. Nor is the cause of all this attention of difficult discovery. So long as oxen supply our daily food, and an important portion of our habitual dress, so long will every thing connected with them possess the highest agricultural and commercial interest. Besides, the study of these wild cattle creates a kind of antiquarian and chivalrous, not less than a literary excitement, and the scientific questions involved, connected with the intermixture of different species—the propagation of hereditary peculiarities, and many others—yield not in importance to the grounds of interest already specified. For the entertainment of our readers, we shall, in this article, supply a description of the animals as they occur at Cadzow in Lanarkshire, usually called the *Hamilton breed*, and at Chillingham Park, near Wooler in Northumberland; and shall, in another, consider how far their appearance and habits, together with the light thrown upon them by history, enable us to come to any satisfactory conclusion concerning their origin and true character. The accounts, though not altogether such as naturalists might desiderate, are yet tolerably ample.

The *Chase*, as it is called, of Cadzow, where the Hamilton cattle (from belonging to the Duke of Hamilton) are confined, was formerly a park or forest attached to the royal castle of Cadzow, where the ancient British kings of Strathclyde, and subsequently the kings of Scotland, used frequently to reside, and hold their courts. The oaks with which the Park is studded over, are evidently very ancient, some of them being supposed to have been planted by David first Earl of Huntingdon, about the year 1140, and many of them are of enormous size. The Chase is altogether of princely dimensions, amounting to between 1500 and 1600 Scottish acres, and presenting a prospect never witnessed by a stranger without mingled feelings of admiration and delight.

The number of cattle at present kept in the Park is upwards of sixty; a number regulated by the supply of food which their appointed range naturally supplies. They are usually denominated the *white cattle*, and are described as being of a dun-white colour; the inside of the ears, the muzzle, tongue, and hoofs alone, being black, the fore part of the leg, from the knee downwards, being mottled with black: the cows seldom have horns. Their bodies are thick and short, their heads round, and their limbs stout. The number of ribs is thirteen, though fourteen is stated occasionally to have occurred. When the calves are off the markings above described, they are either entirely black, or entirely white, or black and white, but never red or brown. Having been from time immemorial exposed without any covering to the rigours of the climate, they are exceedingly hardy; and having never been caught or subjected to the sway of man, they are remarked to be peculiarly wild and intractable. Their affection for their young is excessive; when dropt, they carefully conceal them in long grass or weeds, among some brushwood or thickets, and approach them cautiously twice or thrice a-day for the purpose of suckling them. On these occasions it is not a little dangerous to approach their place of retreat, the parent cow being seldom at a great distance, and always attacking any person or animal that comes near it with the utmost resolution and fury. The young calves, when unexpectedly approached, betray great trepidation, by throwing their ears back close upon their necks, and lying squat down upon the ground. The young, consequently, are withdrawn from the flock by stealth, when only a day or two old; they are approached when slumbering; their mouths are instantly stopped, otherwise their cry would attract the dam, and she, by loud

bellowing, would bring the whole flock to the spot, which would furiously attack the intruder.

The cattle are seldom seen scattering themselves indiscriminately over the pasture like other breeds of cattle, but they are generally observed to feed in a compact flock. The method with which they gather their daily food is not a little remarkable. It is no random occupation, but seems conducted by a rare instinct, which appears greatly blunted, if not lost, in domesticated animals. At different periods of the year their range is different, but they are always found about the same part of the forest at the same hour of the day. In the height of summer they always bivouac for the night near the northern extremity of the forest: from this point they start in the morning, and browse to the southern extremity, and return at sunset to their rendezvous. They are very chary of being approached by strangers, and seem to have a power of smelling them at a great distance. When any one comes near them unexpectedly, they generally scamper off at a little distance to leeward, and then turn round in a body to smell him. In these gambols they invariably affect circles, and when they do make an attack—which is seldom the case—should they miss the object of their aim, they never return upon it, but run straight forward, without venturing to look back. The bulls are seldom ill-natured; but when they are so, they display a disposition more than ordinarily savage, cunning, pertinacious, and revengeful. "A poor bird-catcher," says Mr Patrick, "when exercising his vocation among the 'old oaks,' as the Park is familiarly called, was attacked by a savage bull. By great exertion he gained a tree before his antagonist made up to him, where he had an opportunity of observing its habits. It did not roar nor bellow, but merely grunted; the whole body quivered with passion and savage rage; and it frequently attacked the tree with its head and hoofs. Finding all to no purpose, it left off the vain attempt, began to browse, and removed to some distance from the tree. The bird-catcher tried to descend, but his watchful Cerberus was again instantly at his post, and it was not till after six hours' imprisonment that the unfortunate man was relieved by some shepherds with their dogs." On another occasion, "a writer's apprentice," who had been at the village of Quarter on business, and who returned by the "oaks" as a near cut, was also sadly beleaguered by one of these brutes. He was attacked in a summer evening near the northern extremity of the forest, was fortunate, however, in getting into a tree, but was watched by the bull, and kept in durance throughout the whole night, and till near two o'clock of the afternoon of next day.

The only method of slaughtering these animals is by shooting them. When the keepers approach them for this purpose, they seem perfectly aware of their danger, and gallop away with great speed in a dense mass, so that a carpet might cover them, preserving a profound silence, and generally keeping by the sides of the fields and fences. The cows which have young, in the mean time, forsake the flock, and repair to the places where their calves are concealed, where, with flaming eyes, they seem resolved to maintain their ground at all hazards. These retreats are, of course, always avoided. When the object of pursuit is one of the larger bulls, it becomes a very hazardous employment, some of them receiving a great many bullets before they are killed. When thus fretted, they usually become furious, and, owing to their great swiftness and prodigious strength, they are then objects of more than ordinary dread.

We turn now to the Northumberland breed, and will take our account (as of the foregoing animals) strictly from those who were original observers.

Chillingham Park, in the words of Lord Tankerville, is undoubtedly a very ancient one. From a copy of the Endowment of the Vicarage, extracted from the Records of Durham, and referring to a period as early as the reign of King John, about the year 1220, the vicar, it would appear, was to be allowed "as much timber as he wanted for repairs, of the best oak, out of the great wood of Chillingham," the remains of which wood, Lord Tankerville adds, were extant in the time of his grandfather. The most ancient part of the castle appears to have been built in the next reign, that of Henry III., since which time it has been held without interruption by the family of Grey. At what time, or by what process, the Park became enclosed, it is impossible now to determine; but it is reasonable to suppose that in order to secure the cattle, wild and tame, recourse was had to the enclosure, "probably at an early period." The Park includes between fifteen hundred and eighteen hundred acres; combining, besides good pasture, a range of wild and rocky moor, interspersed with abundant wood and cover for shelter, approximating it, as near as any enclosure can do, to the wild nature of their original habitation. The herd at present amounts to about eighty, consisting of twenty-five bulls, forty cows, and fifteen steers, and no sight can be more beautiful than to see them retreating, in regular order, into their forest sanctuary. In form they are beautifully shaped; their back is straight, their legs short, their horns of a very fine texture; their skin is thin, so that some of the bulls appear to be cream-coloured. The eye and eyelashes, and tips of the horns, alone, are black; the muzzle is brown, the inside of the ears red or brown, and all the rest of the animal white. Even the bulls have no manes, but only a little coarse hair upon the neck. Their cry is peculiar, more like that of a wild beast than that of ordinary cattle. They fight for supremacy, until a few of the more powerful subdue the others, who afterwards sub-

mit to the rule of superior physical strength. If by accident a bull get separated from the herd for a day or two, his restless relation seems to be forgotten, for on his rejoining it a fight ensues, and the conflict continues until the previous amicable understanding is re-established.

The following particulars concerning the habits of this breed are supplied by the noble proprietor. They have pre-eminently all the characters of wild animals. They hide their young, feed in the night, basking or sleeping during the day; they are fierce when pressed; but, generally speaking, very timorous, moving off on the appearance of any one, even to the greatest distance. Yet this varies very much in different seasons of the year, and according to the manner in which they are approached. "In summer," says his lordship, "I have for several weeks at a time not got a sight of them, retiring on the slightest appearance of any one, into a wood which serves them as a sanctuary. On the other hand, in winter, when coming down for food into the inner park, and being in contact with people, they will let you almost come amongst them, particularly if on horseback. But then they have also a thousand peculiarities. They will be feeding sometimes quietly, when, if any one appears suddenly near them, particularly coming down the wind, they will be struck with a sudden panic, and will gallop off, running one after another, and never stopping till they get into their sanctuary. It is observable of them, as of red-deer, that they have a peculiar faculty of taking advantage of the irregularities of the ground, so that on being disturbed they may traverse the whole park, and yet you hardly get a sight of them. Their usual mode of retreat is, to get up slowly, set off in a walk, then a trot, and they seldom begin to gallop till they have put the ground between you and them in the manner described. When they come down into the lower part of the park, which they do at stated hours, they move like a regiment of cavalry, in single files, the bulls leading the van, as in retreat they take the rear. Lord Ossulston was witness of a curious way in which they took possession of some new pasture recently laid open to them. It was in the evening about sunset. They began by lining the front of a small wood, which seemed quite alive with them, and of a sudden they made a dart forward altogether in a line, and charging close by him across the plain, they spread out, and after a little time began feeding."

The following anecdote, also supplied by Lord Tankerville, is illustrative of their noble, though savage bearing. "A bull being doomed to death, one of the keepers proceeded to separate it from the rest of the herd: this the bull resented, and having been frustrated in several attempts to join the others, by the keeper interposing, the bull made a rush at him, and got him down; it then tossed him three several times, and afterwards knelt down upon him, and broke several of his ribs. No person being present but a boy, the only assistance at hand was a deer-hound, which immediately attacked the bull, and by biting its heels, withdrew it from the man, and eventually saved his life. The bull, however, never left the keeper, but continually watched him, returning from time to time afresh to toss him. In the mean while, information reached the castle, when all the gentlemen sallied forth with their rifles. One good marksman, being planted behind a fence, at the distance of twenty-five yards, fired repeatedly at the animal, but it was not till six or seven balls had actually entered the head, and one of them the eye, that the bull at last fell. During the whole time it never flinched, nor changed its ground, merely shaking its head as it received the several shots. On another occasion, Lord Ossulston had a narrow escape from a bull which had been wounded and separated from the herd. It attacked him on horseback, and at the first onset overthrew and gored the horse to death."

Another incident, which is often quoted as illustrative of their native wildness, is thus stated by Mr Bailey. "The writer of this narrative found a hidden calf, two days old, very lean and very weak; on stroking its head, it got up, pawed two or three times like an old bull, bellowed very loud, retired a few steps, and bolted at his legs with all its force; it then began to paw again, bellowed, stepped back, and bolted as before; but knowing its intention, and stepping aside, it missed me, fell, and was so very weak, that it could not rise, though it made several efforts. But it had done enough; the whole herd were alarmed, and coming to its rescue, obliged me to retire; for the dams will allow no one to touch their calves, without attacking them with impetuous ferocity."* Mr Bailey adds, "The mode of killing (lately practised) them, was perhaps the only modern remains of the grandeur of ancient hunting. On notice being given that a wild bull would be killed upon a certain day, the inhabitants of the neighbourhood came mounted, and armed with guns, &c., sometimes to the number of one hundred horse, and four or five hundred foot, who stood upon walls, or got into trees, while the horsemen rode off the bull from the rest of the herd, until he stood at bay, when a marksman dismounted and shot. At some of these huntings, twenty or thirty

shots have been fired before he was subdued. On such occasions, the bleeding victim grew desperately furious, from the smarting of his wounds, and the shouts of savage joy which were echoing from every side. From the number of accidents which happened, this mode has seldom been practised lately."

It has been stated of the Chillingham cattle, "that the calves are occasionally taken from the cow, and brought up with the domestic herd of the neighbouring farmers, and that they grow up quite gentle, and precisely like other cattle;"† and again, in the Naturalist's Library, that a few years ago a fine ox of this herd was fed to a large size, and was quite tame and gentle; and it is added, that the present keeper of the Park at one time possessed a cow, which he had taken when a calf, in consequence of the death of its mother: it was gentle, and was milked like the other cows, and bred freely with the common bull. Precisely the same report has been made of the Cadzow breed; in the words of the Quarterly Journal, "they may be easily domesticated."

One circumstance should by no means be omitted in our consideration of both these herds, namely, that there is a certain tendency in the young to be "off the markings," as it is called, that is, to differ more or less in appearance from their parents; and all such are in both localities destroyed. This, of course, maintains them in an artificial state, preventing any thing like the true type from appearing, and effectually contributes to preserve but one uniform appearance.

Upon a careful review of the several accounts of these two breeds, the naturalist cannot, we think, but demur to the conclusion, often so decidedly drawn, that they are very distinct and different from each other. The anxiety of the partisans of these several herds to maintain their exclusiveness, is quite amusing. Thus the noble author states that the breed at Hamilton "in no degree resembles those at Chillingham;" while Mr Brown, chamberlain to the Duke of Hamilton, says, "the Hamilton breed of wild cattle differs in many respects from any other known breed." Mr Patrick is quite indignant that this should be regarded as a degenerate breed, and Dr Knox, backed by Mr Plummer, comes forward as their champion, declaring they have maintained their weight and other good qualities. Notwithstanding this apparent anxiety to reach an opposite conclusion, we venture humbly to assert that there can be little or no doubt that they are one and the same breed. It is true there are some differences. Those at Cadzow, compared with the Chillingham herd, are stated to be more robust in the form of their bodies; their colour is dun-white, with black ears, muzzle, and hoofs; whilst the others are said to have marks of higher breeding, being, at the same time, of the same general colour, sometimes cream-coloured, with black muzzle, and the whole of the inside, and about a third of the outside, red. Without at all insisting upon a fact stated by Mr Bewick, "that about forty years ago some of the Chillingham cattle had black ears, and that the keeper accordingly destroyed them," and on another mentioned by Major H. Smith, that the breed at Burton Constable in Yorkshire (destroyed by a murrain at the middle of last century) had the ears and tip of the tail black, we affirm that these differences sink into nothingness in comparison of the diversities seen in domestic breeds, which are yet regarded as one species, and upon the whole are so insignificant, that, far from establishing a distinct species, they cannot with propriety, in our apprehension, be considered as sufficient to constitute even a variety.

Besides Cadzow and Chillingham, it would appear that this breed is likewise maintained in some other localities in England, as formerly in Scotland. That of Chartley Park in Staffordshire, belonging to Lord Ferres, is best known; and here the breed is acknowledged closely to resemble that in Northumberland. This park is a very ancient one, which formerly belonged to Devereux, Earl of Essex; and the belief is, that the cattle have been there from time immemorial. Lynn Park, in the neighbouring county of Cheshire, has been named as another retreat; but no additional facts are to be gleaned from the scanty information which has been supplied from these sources.

THE ORIGINAL OF PAUL AND VIRGINIA.

It often happens that an insignificant circumstance, an obscure fact, an unexpected occurrence, gives birth to the most happy conceptions. Fables and other fictions are in general the reflection of truth, a little heightened in colour, indeed, from the prismatic medium through which they have been transmitted. Imagination even of the wildest description must, like a bird, touch earth before it commence its flight. It is a natural and useful curiosity which prompts men to investigate the point from which genius sets out, for the purpose of measuring its flight, and of judging the height to which it has soared. Sometimes it condescends to admit us to its confidence, convinced that it can lose nothing by the disclosure, and this has very frequently been the case of late years—witness Scott and others. But much oftener genius only presents us with the finished edifice, carefully removing every trace of the scaffolding and other materials by which it had been reared; much oftener does it designedly efface its steps, and hide from us the path which it has taken from the real to the ideal world. Rousseau has left us in ignorance whether

his *Héloïse* was a pure fiction, and Saint Pierre, his friend and disciple, has designedly cast a mysterious veil over the historical parts of his beautiful pastoral. Time, however, which discovers most things, has at length lifted that veil. It is now more than a century ago that one of the French East India Company's ships was lost off the Isle of France, now called the Mauritius. Of the numerous crew on board, only nine men were saved, and they gave an account of the shipwreck before the tribunal of the island. The papers containing their depositions, after being buried amongst the local records for nearly a hundred years, were brought to light by the commandant of the island whilst it was under the dominion of France. The wrecked vessel was called the *St Geran*, and it was on board the *St Geran* that Saint Pierre has placed the sublime and touching circumstance of the death of Virginia. It is interesting to observe how the tradition, which was preserved in the Isle of France, has become, in the hands of a great writer, the foundation of so admirable a work. A young lady was, in fact, on board the *St Geran*, and perished there, together with a young naval officer, who resolved to share her fate. The ridiculous scruple of the captain of the vessel, who refused to strip off his clothes, saying that it was not consistent with his rank to reach the shore without his uniform, and that he had papers in his pocket, the possession of which he could not part with, has been transferred by the author to the heroine of the shipwreck, and has furnished one of the most forcible and original situations of his prose poem. By substituting the enthusiasm of a female for the susceptibility of a seaman, he has rendered the fiction more morally true than the truth itself—he has certainly made it much more consistent with every-day human nature. This is a striking example of the power which a superior mind possesses of transferring the events of the world to the dominion of imagination, and of becoming as much a creator as is compatible with nature and vraisemblance.

THE QUESTION OF IRON OR WOOD STEAMERS.

THE remarkable success which has attended the steam navigation of the Atlantic, has had the effect of raising the most sanguine anticipations regarding the future powers of steam-vessels. For one thing, much is expected from the employment of iron instead of wooden vessels. The introduction of iron steam-ships is, however, a thing of a very critical nature, and must be maturely considered. The public should be made fully acquainted with the result of practical experiments in the sailing of iron vessels, and particularly in their endurance of tumultuous seas, before giving its confidence to any project of this nature. Scientific and practical men, through the public press, should likewise canvass the subject in all its important bearings. A writer in the *Athenæum* (Jan. 5, 1839) has opened the question with the ability usually displayed in that print. A few of his observations are well worthy of attention.

"What (he asks) are the peculiarities of iron as a material for steam-ships, that give it a preference over timber? Timber has, first, its principal strength only in one direction. From the reedy, fibrous, vesicular structure of the vegetable, it resists a distending force with great strength along the fibres, but offers a very slender opposition to any force that would tear the vegetable fibres asunder, so as to split or splinter it. To remedy this evil, there must always be two sets of timber in transverse directions. The planks of a ship are laid with their fibres in one direction, and the timbers are laid with their fibres at right angles, for the purpose of giving strength laterally, and binding them together. But iron plates are nearly equally strong in both directions, so that if we conceive a plank of wood obtained of strength equal to iron lengthways, and a second plank procured of the same size, with fibres in the lateral direction, the one plate of iron would have nearly the same tensile strength as both united. If, therefore, we substitute for the planking of the vessel a shell of iron, the cross-timbers become unnecessary, their place being supplied by the lateral strength of the metal.

The next peculiarity of iron is the perfection and strength of its joinings. To make a wooden ship water tight, its parts are severely strained—in caulking its planking, a very acute wedge-shaped tool struck by a mallet forces the oakum between the planks, which only retain it by a strain; and from the disunion of the planks a vessel begins to leak whenever she encounters a heavy gale. The rivetting of the iron plates effects a thorough union of them of such a nature as to render the joints closer than those of the newest ship, and instead of remaining detached, like planks, they become integral parts of one homogeneous whole, equally strong in every direction. A well-built iron vessel is almost bottle-tight.

The facility with which iron can be formed into any shape, and made of any size, is its next recommendation. Timber must be selected with much care and at great expense, in order to suit those parts of the vessel where it is to be placed, and the form of the vessel is in some measure trammelled by the shape of timber that can be readily obtained for the purpose. It is also out at great expense, rendering what remains of comparatively little value. On the other hand, every scrap of iron can be wrought up to any required form, and not a pound be lost, but be made available to any purpose, while all the plates, and knees, and bolts, and straps, have that form given to them by which they are kept in their place. Facility, economy, strength of construction, appear then to favour the iron.

Diminution of danger from fire may perhaps be regarded as not one of the least advantages of iron ships.

From the great tensile strength of iron, from the perfection of its joinings, and from the absence of transverse timbers, it follows that the hull of an iron vessel will both be abundantly strong and tight, although only of half

* It ought to be added, to Lord Tankerville's credit, that he has recently requested several public bodies (the British Museum, and Royal College of Surgeons, Edinburgh, as we have heard) to accept of the carcass of an animal of this breed for scientific investigation; an offer which, we understand, has been gladly accepted.

† Agricultural Report of Northumberland, by J. Bailey and G. Culley. Major H. Smith attaches this anecdote to Dr Fuller, and so precisely in the same words, that its true origin is not doubtful. To the same author we owe the succeeding particulars, sometimes ascribed to Mr Bewick.

* General View of the Agriculture of Northumberland, &c., p. 124.

† Quarterly Journal of Agriculture, ix. 376.

the weight of a timber vessel; hence the difference may be supplied in cargo, engines, and fuel, or a great saving of space effected.

Finally, if surface condensation be adopted, the cold surface of the vessel exposed to the water may be used for a condenser, by having an inner lining or jacket over the part so used, sufficiently stayed asunder at small and frequent intervals.

All, however, that we have said as likely to follow from the extensive introduction of iron vessels, must be received with great caution; and if very great precautions are not adopted in anticipating the many peculiarities of the metallic ships, serious evils will be the consequence.

For example, an iron vessel once met with the following accident:—Going along at full speed, something gave way about the engine—the piston-rod and piston went right down through the bottom of the cylinder and the bottom of the boat, into the sea, leaving its place of exit for the entrance of water: by an extraordinary coincidence, another steam-vessel was alongside at that instant, and all were saved! Such an occurrence as this in the middle of the Atlantic or the Bay of Biscay would be rather awkward. Again, an iron vessel touched by accident a stone of considerable size, which perforated her bottom, and she went down instantly—this is rather quick work. These facts are sufficient to point out the necessity of extreme caution in suddenly adopting the metallic ships on the large scale, and lead us to direct our attention to their structure, so as to avoid those dangers to which they may be peculiarly liable. Further, the rapidity with which iron ships are corroded by the action of salt water, is a point of interesting research. On this subject the experiments of the British Association, carried on under the direction of Mr Mallet, of Dublin, may be advantageously consulted.

With the view of preventing danger from accidental and local injury to the shell of the vessel, the system of water-tight compartments, already partially adopted, must be carried out to its greatest extent. The subdivision of the hold must be carried to a greater extent than any thing we have yet heard of; so that if by any chance water do find its way into the hold, it shall only fill a small part of the vessel. To do this will be most difficult about the engines. These partitions will, however, have another very great advantage, in the strength and stiffness they will give to the hull of the vessel; it will become like the shell of the nautilus, capable of resisting an enormous external force. We have seen an iron vessel, whose length was ten times her beam, hung on two blocks at her extremities, without sensible flexure in the middle, and without any further means of internal support than her frequent partitions of iron plate.

But there is another point of primary importance, which will give much trouble, if not properly provided for, and it is this—the great weight of engines and boilers placed about the centre of the length of the vessel. These produce a depression at the centre, which is resisted sufficiently in a timber vessel, by the great depth of the keelsons, and of the bottom of the vessel, but which the thinness of the iron plate will not enable it to withstand. Further, the small quantity of matter in the hull renders it very subject to motion from the action and reaction of the steam and piston in the cylinder. We have noticed the centre of one of the finest iron steam-ships rising and falling and twisting under the action of the engine, in a manner both unpleasant to the passenger, and very injurious to the shell of the vessel. These and similar evils are only to be guarded against by such a system of framing and tying as the Americans adopt in the very slender hulls of their river boats, and whereby the strain of the machinery becomes 'self-contained,' that is to say, is wholly counteracted by the strength of its own framing, and whereby the whole buoyant part of the vessel is made to contribute its own portion to the support of those strains which necessarily result from driving a vessel, from a single point within it, with great force against a resisting medium."

Since the above was put in types, we learn that an iron steam-vessel, the Ironsides of Liverpool, 262 tons, has made a transatlantic voyage from that port, and returned. She sailed from Liverpool to Pernambuco, which lies in latitude 8 degrees south, in forty-seven days, mostly in very tempestuous weather, and the voyage back was made in thirty-six. This looks well; but we are of opinion that, until vessels for goods have experienced an ample trial, it would be rash to start any for passengers.

EMPLOYMENT FOR THE UNHAPPY.

THE unhappy are indisposed to employment: all active occupations are wearisome and disgusting in prospect, at a time when every thing, life itself, is full of weariness and disgust. Yet the unhappy must be employed, or they will go mad. Comparatively blessed are they, if they are set in families where claims and duties abound and cannot be escaped. In the pressure of business there is present safety and ultimate relief. Harder is the lot of those who have few necessary occupations, enforced by other claims than their own harmlessness and profitability. Reading often fails. Now and then it may beguile; but much oftener the attention is languid, the thoughts wander, and associations with the subject of grief are awakened. Women who find that reading will not do, will obtain no relief from sewing. Sewing is pleasant enough in moderation to those whose minds are at ease the while; but it is an employment which is trying to the nerves when long continued, at the best; and nothing can be worse for the harassed, and for those who want to escape from themselves. Writing is bad. The pen hangs idly suspended over the paper, or the sad thoughts that are alive within write themselves down. The safest and best of all occupations for such sufferers as are fit for it, is intercourse with young children. An infant might beguile Satan and his peers the day after they were couched on the lake of fire, if the love of children chanced to linger amidst the ruins of their angelic nature. Next to this comes honest, genuine acquaintanceship among the poor; not mere charity-visiting, grounded on soup

tickets and blankets, but intercourse of mind, with real mutual interest between the parties. Gardening is excellent, because it unites bodily exertion with a sufficient engagement of the faculties, while sweet, compassionate Nature is ministering cure in every sprouting leaf and scented blossom, and beckoning sleep to draw nigh, and be ready to follow up her benignant work. Walking is good: not stepping from shop to shop, or from neighbour to neighbour, but stretching out far into the country to the freshest fields and highest ridges, and the quietest lanes. However sullen the imagination may have been among its griefs at home, here it cheers up and smiles. However listless the limbs may have been when sustaining a too heavy heart, here they are braced, and the lagging gait becomes buoyant again. However perverse the memory may have been in presenting all that was agonising, and insisting only on what cannot be retrieved, here it is first disregarded, and then it sleeps; and the sleep of the memory is the day in paradise to the unhappy. The mere breathing of the cool wind on the face in the commonest highway, is rest and comfort, which must be felt at such times to be believed. It is disbelieved in the shortest intervals between its seasons of enjoyment; and every time the sufferer has resolution to go forth to meet it, it penetrates to the very heart in glad surprise. The fields are better still; for there is the lark to fill up the hours with mirthful music; or, at worst, the robin and the flocks of fieldfares, to show that the hardest day has its life and hilarity. But the calmest region is the upland, where human life is spread out beneath the bodily eye; where the mind roves from the peasant's nest to the spire town, from the schoolhouse to the churchyard, from the diminished team in the patch of fallow, or the fisherman's boat in the cove, to the viaduct that spans the valley, or the fleet that glides, ghost-like, on the horizon. This is the perch where the spirit plumes its ruffled and drooping wings, and makes ready to let itself down any wind that heaven may send.—*Miss Martineau's Deerbrook.*

POINTS WHERE A PATIENT MAY JUDGE FOR HIMSELF.

FIRST, the patient may almost always safely choose a temperature for himself; and inconvenience in most cases, positive harm in many, will be the effect of opposing that which he desires. His feeling here is rarely, if ever, that of theory, although too often contradicted by what is merely such. It represents in him a definite state of the body, in which the alteration of temperature desired is that best adapted for relief, and the test of its fitness usually found in the advantage resulting from the change. This rule may be taken as applicable to all fevers, even to those of the exanthematous kind; where, with an eruption of the skin, the balance between the outer and inner surfaces of the body, and the risk of repression, might seem, and actually are, of greatest importance. In whatever stage the eruption be, if the patient expressly seeks for a cooler atmosphere or cooling applications, they may be fully conceded to him without fear of ill result, and under the guidance chiefly of his feelings as to the time during which their use may be continued. Except in some cases of vitiated sensation from nervous disease, I have scarcely ever known the judgment of a patient practically wrong on these points; and in this case of exception the error itself is of very little consequence.

Secondly, in the majority of instances of actual illness, provided the real feelings of the patient can be ascertained, his desires as to food and drink may safely be complied with. Whatever be the physical causes of the relation (and they are yet beyond our research), the stomach itself is the best expounder of the general and more urgent wants of the system in this particular. But undoubtedly much care is needful that we be not deceived as to the state of the appetites, by what is merely habit or wrong impression on the part of the patient, or the effect of the solicitation of others. This class of sensations is much more nurtured out of the course of nature than are those which relate to the temperature of the body. The mind too becomes much more deeply engaged with them; and though in acute illness they are generally submitted again to the natural law, there are many lesser cases where enough remains of the leaven of habit to render every precaution needful. With such precautions, however, which every physician who can take schooling from experience will employ, the stomach of the patient becomes a valuable guide—whether it dictate abstinence from or recurrence to food—whether much or little in quantity—whether what is solid or liquid—whether much drink or little—whether things warm or cold—whether sweet, acid, or saline—whether bland or stimulating to the taste.

As respects limitation of food, indeed, the "tempestiva abstinencia" is often with the patient himself an urgent suggestion of nature, especially in cases where fever is present. It is a part of the provision for cure which we hold in our hands; and if not sufficiently regarded, all other remedies lose greatly of their value. Here, then, we are called upon to maintain the cause of the patient, for such it truly is, against the mistaken importunities which surround him, and which it sometimes requires much firmness to put aside.

It is not wholly paradoxical to say that we are authorised to give greatest heed to the stomach when it suggests some seeming extravagance of diet. It may be that this is a mere deprivation of the sense of taste; but frequently it expresses an actual need of the stomach, either in aid of its own functions, or indirectly, under the mysterious law just referred to, for the effecting of changes in the whole mass of blood. It is a good practical rule in such cases to withhold assent, till we find, after a certain lapse of time, that the same desire continues or strongly recurs; in which case it may generally be taken as an index of the fitness of the thing desired for the actual state of the organs. In the early stage of recovery from long gastric fevers, I recollect many curious instances of such contrariety to all rule being acquiesced in, with manifest good to the patient. Dietetics must become a much more exact branch of knowledge, before we can be

justified in opposing its maxims to the natural and repeated suggestions of the stomach, in a state either of health or disease.

Thirdly, as regards exertion of body, posture, continuance in bed or otherwise, the sick may generally be allowed their own judgment, provided it is seen to be one dependent on bodily feelings alone. And so equally with respect to fresh air, methods of exercise, and times of repose. In these things, as on points of diet, suggestions, founded on careful notice of the feelings of the patient, and watchfulness as to the effect of the first trials, are all that is required from the physician; and more than this often does mischief. I have often witnessed the ill effects of minute interference in such matters; whether arising from excess of caution, or from the mischievous spirit of governing every thing by medical rule and authority; without appeal to the feelings of the patient, even where these may securely be taken in evidence.

The most important exception to this rule is in certain nervous and dyspeptic disorders of a chronic kind, where it is needful to urge bodily exertion upon the patient, in contradiction to his own sensations, and sometimes even where the first trials are seemingly unsuccessful. With moderate care in observation, the tests of fitness here are so sensible, that there can be little chance of any error leading to injurious consequences.

As respects mental exertion during illness or convalescence, much more caution is needful. Here the patient is usually less able to estimate his own power, and is more entirely at the discretion of those around him. The present condition of life among the higher classes produces as much of evil from excesses of moral and intellectual excitement, as from those of the stomach; and it is equally difficult to place watch and reasonable restraint upon them. In these instances, and they are of constant occurrence, the judgment of the physician, as well as firmness in his manner of interference, are urgently required. But in ordinary cases, and under more tranquil modes of life, he may leave much to the discretion and feeling of power in the patient himself: with the simple injunction that this feeling should be duly consulted before any change is made.—*Dr Holland's Medical Notes and Reflections.*

THE THREE SONS.

I have a son, a little son, a boy just five years old, With eyes of thoughtful earnestness, and mind of gentle mould. They tell me that unusual grace in all his ways appears, That my child is grave and wise of heart beyond his childish years.

I cannot say how this may be, I know his face is fair, And yet his chiefest comeliness is his grave and serious air: I know his heart is kind and fond, I know he loveth me, But loveth yet his mother more with grateful ferrency. But that which others most admire, is the thought that fills his mind;

The food for grave inquiring speech he every where doth find. Strange questions doth he ask of me, when we together walk; He scarcely thinks as children think, or talks as children talk, Nor cares he much for childish sports, doats not on bat or ball, But looks on manhood's ways and works, and aptly mimics all; His little heart is busy still, and oftentimes perplex With thoughts about this world of ours, and thoughts about the next.

He kneels at his dear mother's knee, she teacheth him to pray, And strange, and sweet, and solemn, are the words which he will say.

Oh! should my gentle child be spared to manhood's years, like me, A bolder and a wiser man I trust that he will be; And when I look into his eyes, and stroke his thoughtful brow, I dare not think what I should feel, were I to lose him now.

I have a son, a second son, a simple child of three; I'll not declare how bright and fair his little features be; How silver sweet those tones of his when he prattles on my knee; I do not think his light-blue eye is like his brother's, keen, Nor his brow so full of childish thought as his hath ever been; But his little heart's a fountain pure of kind and tender feeling, And his every look's a gleam of light, rich depths of love revealing. When he walks with me, the country folks, who pass us in the street,

Will shout for joy, and bless my boy, he looks so mild and sweet. A playfellow is he to all, and yet, with cheerful tone, Will sing his little song of love, when left to sport alone. His presence is like sunshine sent to gladden home the earth, To comfort us in all our griefs, and sweeten all our mirth. Should he grow up to riper years, God grant his heart may prove As sweet a home for heavenly grace as now for earthly love; And if, beside his grave, the tears our aching hearts must dim, God comfort us for all the love which we shall lose in him.

I have a son, a third sweet son, his age I cannot tell, For they reckon not by years and months where he has gone to dwell.

To us, for fourteen anxious months, his infant smiles were given, And then he bade farewell to earth, and went to live in heaven. I cannot tell what form is his, what looks he weareth now, Nor guess how bright a glory crowns his shining seraph brow. The thoughts that fill his sinless soul, the bliss which he doth feel, Are numbered with the secret things which God will not reveal. But I know, for God hath told me this, that he is now at rest, Where other blessed infants be, on their Saviour's loving breast. Whate'er befalls his brethren twain, his bliss can never cease; Their lot may here be grief and fear, but his is certain peace. It may be that the tempter's wiles their souls from bliss may sever,

But if our own poor faith fall not, he must be ours for ever. When we think of what our darling is, and what we still must be; When we muse on that world's perfect bliss, and this world's misery:

When we groan beneath this load of sin, and feel this grief and pain, Oh, we'd rather lose the other two, than have him here again.

FACTS ON FEASTS.

THE extravagant niceties of the great in the days of the Roman empire, are universally familiar—as, for instance, the killing of six hundred ostriches by Helio-gabalus for the sake of their brains to make a single dish—the laying up of ninety thousand sesterces by Apicius to be expended in feasting, and his killing himself for fear of want when the sum was reduced to ten thousand—and many others to the like effect. It were desirable, while we exclaim against these deifiers of the palate, that we took some thought as to particular and general revivals of the same worship in our own day. As to particular revivals, hear the following passage from Meg Dods's amusing cookery book, respecting a Mr Rogerson, "an enthusiast," she says, "and a martyr." "He, as may be presumed," says the sage Mrs Margaret, though we should like to see fact instead of presumption, "was educated at that university where the rudiments of palatic science are the most thoroughly impressed on the ductile organs of youth. His father, a gentleman of Gloucestershire, sent him abroad to make the grand tour; upon which journey he attended to nothing but the various modes of cookery, and methods of eating and drinking luxuriously. Before his return his father died, and he entered into the possession of a very large monied fortune, and a small landed estate. He was now able to look over his notes of epicurism, and to discover where the most exquisite dishes and the best cooks were to be procured. He had no other servants in his house than cooks: his butler, footman, housekeeper, coachman, and grooms, were all cooks. He had three Italian cooks, one from Florence, another from Sienna, and a third from Viterbo, for dressing one dish, the *doce piccante* of Florence. He had a messenger constantly on the road between Brittany and London, to bring him the eggs of a certain sort of plover, found near St Maloes. He has eaten a single dinner at the expense of fifty-eight pounds, though himself only eat down to it, and there were but two dishes. He counted the minutes between meals, and seemed totally absorbed in the idea, or in the action of eating; yet his stomach was very small—it was the exquisite flavour alone that he sought. In nine years he found his table dreadfully abridged by the ruin of his fortune, and himself hastening to poverty. This made him melancholy, and brought on disease. When totally ruined (having spent £150,000), a friend gave him a guinea to keep him from starving; and he was found in a garret soon after, roasting an ortolan with his own hands. We regret to add, that a few days afterwards this extraordinary youth shot himself."

Though we may hope that few carry gastronomy to the degree of phrenzy shown by ill-fated Mr Rogerson, we know only too well how much more than a rational portion of time, thought, and income, is devoted by many of the wealthy amongst us to the affairs of the stomach. Through the fostering patronage of this part of our community, the profession of a cook has risen to a degree of importance which those of medicine, law, and divinity, scarcely rival. A doctor does well if he clears five hundred a-year in the country, or eight hundred in a town. Out of six hundred highly educated advocates at the Scottish bar, one makes above three thousand a-year, two make between two and three thousand, six will make above one thousand, other twenty will make something, and the rest will either have joined the ranks of the gentlemen who are not anxious for business, or be vainly endeavouring to get a guinea case for once and away. Honest assiduous country curates and Scotch ministers are thought well off with their two hundred a-year; and the average income of the whole of the clergy of Great Britain is not three hundred a-piece. What, under these circumstances, are we to think of head cooks whom nobles hire at a thousand, yea, even fifteen hundred a-year!—a set of gentlemen who only, moreover, direct the procedure of the kitchen, or at most

cook one or two of the principal dishes—after which they retire from business for the day. What are we to think of the individual who makes a thousand a-year in London by preparing salads—calling in his coach, at one house after another, to dress that one dish, and pocketing his guinea for each cast of his art! Every one has heard of the cook who declined an offered engagement in Dublin, not from the inadequacy of the salary, for that was ample, not from any dislike to the gentleman offering the engagement, for he was all that even a cook could wish in the way of master, but—because there was no opera in Dublin! This and similar stories may seem only good jokes to many simple people; but they are real, every one of them. Even in our own poor northern soil, we could point out, within twenty miles of the spot where we are inditing these lines, a nobleman who gives his cook five hundred a-year, a house in his park, and the use of a gig! There is not a preceptor to the children of a noble or landed family in the country, who would not think himself paid like a prince with a third of the money, leaving the gig entirely out of the question.

If luxury were carried to a great height only amongst men who can afford to give these enormous fees to their cooks, we might pass it over amongst the many other extravagances naturally flowing from needlessly large fortunes. But luxury is not confined to such men. There are many of the middle ranks, possessing incomes not exceeding those enjoyed by some cooks, who entertain their friends occasionally in a style of almost overpowering splendour. Indeed, amongst all who are in the least above pecuniary difficulties in this country, and, we fear, many besides who are not so, DINNER now amounts to something of a truly formidable nature. General allegations are fruitless and rapid: let us come to particulars. It is not uncommon, then, for an individual realising perhaps a thousand a-year by trade, to present his small parties of friends with a dinner of the following nature. First, the table exhibits a particular kind of soup at each side, and a particular kind of fish at each end. These being partaken of, and removed, the board is spread anew. A roast of beef is placed at one end, and a joint of lamb or mutton at the other; at one side is a turkey or pair of fowls; at the other a ham or tongue. Four smaller dishes of nameless things, that nobody ever looks at or tastes, occupy symmetrical situations on other parts of the table. This is the high noon of the dinner. When all have eaten of one or more dishes, a new shifting of the scenes takes place, and, lo! the board is spread once more with novelties. Pastry, puddings, and game, now solicit the fading appetite of the guests; and one or all of these are partaken of by most. In the meanwhile, during each pause in eating throughout the evening, gentlemen have been asking ladies to drink wine with them; and a great quantity of sherry, hock, or some light product of the French vintage, has been swallowed. Champagne, also, insinuated by attentive waiters at proper intervals, has, with its provokingly hasty effervescence, called upon the guests for its quick dispatch. After the third course has been removed, a fourth makes its appearance, consisting of cheese, salads, and other trifles; the cloth is now withdrawn, or one cloth is withdrawn, leaving another fresh and clean underneath, whereon speedily appears a range of new dishes, containing fruits, creams, ices, and so forth, all duly attended by the proper wines. Even after all this, fruits are left on the table, to be partaken of during the two or three hours of wine-drinking, which at a moderate computation must follow every formal dinner, wherever British manners prevail. The solemnity, for so it may well be called, concludes with tea and coffee in the drawing-room. We acquire a forcible view of the immense luxury of this mode of satisfying the taste of a few friends, when we take into consideration the duties which the preparation of such a dinner imposes upon the lady of the

house. In the first place, the feast is to be schemed or mapped out in her labouring imagination. The various foods and pastries and fruits are to be bought or ordered. A cook under her direction works first one day at the soups and some of the dessert articles, then another at the remaining dishes. The articles of crockery, crystal, cutlery, and napery, required for the table, are to be taken from their receptacles, scrupulously cleaned, and then laid down in the order in which they are to be used. The great number of these articles required for a dinner party is in itself sufficient to give a startling idea of our progress in luxury. It was lately computed by a friend of ours, who attended a dinner where the guests were twenty-four in number, that, of dishes, plates, glasses, knives, forks, spoons, and other articles of the like nature, required to make up the whole artillery of the feast, or what in theatrical phrase might be styled the *properties*, there were no fewer than TWO THOUSAND—all of which had to be previously cleaned and marshalled under the eye of the silk-decked dame who sat, to all appearance so unconscious of drudgery, at the head of the table. Add to all, the anxiety of mind which this poor lady must undergo as to the exact performance of all their proper duties by cooks and servitors, and the not-breaking-down of any of her finely adjusted arrangements, and we shall scarcely refrain from pitying those who take so laborious a way to make themselves and a few friends happy for a few hours.

When from a private dinner party we transfer our view to one of a public nature, the luxury of our manners takes a still more striking form. We do not allude to those alimentary preparatives to long set speeches which Englishmen are most apt to recognise under the name of a public dinner, where no man gets above two things, and neither of them what he wants, and where even the things he gets are the most execrable of their kind, and totally out of season. We refer to entertainments such as the London trading corporations give annually, or such as gentlemen occasionally give in taverns when wishing to make a particularly handsome acknowledgment to some people for something—in short, downright, deliberately designed treats. Dazzling splendour and almost bewildering variety mark all such affairs. First there are the usual courses of soups and of various kinds of fish—next a course of what the French style *entrées et ros*, consisting (we shall suppose a company of thirty) of a dozen different dishes, most of them dressed with the nicest care, and disguised beyond the recognition of all common palates. Next may come a course of *ros et entremets*, comprehending game, lamb (if new and expensive), and such light matters. Then, again, is the dessert of ices and fruits—the whole being relieved by libations from at least half a dozen kinds of wine. The natural effect of such a variety of tempting viands and liquors, is, that the greater number of guests eat and drink much more than nature requires or will well admit of, and are ill, or at least uneasy, in consequence. The excess, when coolly viewed, appears quite startling. We wish to think and speak with delicacy; yet we cannot help adverting, and we cannot advert without some degree of loathing, to the foul confusion of edibles and potables which each of the guests at such a feast must carry away with him at its close, so much in contrast with the elegance and order in which the same articles were presented at the beginning, and so utterly inconsistent with that simplicity of living which nature calls upon us to observe.

Perhaps the whole subject could not be better summed up than in the words of William Bellenden, Archdean of Moray, who, about three hundred years ago, wrote a history of his native country in his native language, and in that work took occasion to remark upon the new manner of living of *Scottis and the auld*, giving the case against the moderns hollow. William's ideas are broad, plain, and downright, and his style of expressing them is richly quaint beyond almost all we

LIBRARY U.C. RIVERSIDE

know of in old native literature. He certainly describes something more approaching to gluttony than any thing we have experience of now-a-days; yet as a general diatribe against the excesses of the table, it is invaluable for its force and spirit, while neither is it altogether inapplicable to a portion of the presently existing society.

He commences with a beautiful picture of the simplicity of living which prevailed among "our elders," who, he says, "howbeit they wer richt virtewis baith in weir and peace, wer maist exercit with temperance; for it is the *fontane of all virtue*. They wer of temperat sleip, meit, and drink, and sic refectionis as wes preparit with litill laubour or cost. Their breid wes maid of sic stuf as grew maist easlie on the ground. Their vittallis wer nocht sifit, as we do now, to mak thaim delicius to the mouth, bot wer all ground togedder under ane forme. The flesche maist frequent among thame, wes othir wild flesche, won on the fellis be thair hunting, quhillk maid thaim of incredible strenth; or ellis it wes of thair awin tame bestial, especially beif, as we do yit in our dayis. * * The common meit of our elders was flesche; nocht for the plente of it, bot erar* because thair landis lay oftymes waist, throw continewal exercition of chevalry, and for that caus thay leiffit maist of flesche. Thay disjunit airly in the morning with *small refection*, and sustenit thair lifis thairwith quhill the time of sowper; throw quhillk thair stomok was *nevir surfeitly chargit, to empesche thaim of uthir besines*. At the sowper thay war mair large; howbeit they had bot ane cours. Quhen they kest thaimself to be mery, thay usit maist aqua vite; nocht maid of costlie spices, bot of sic naturall herbis as grew in thair awin gardis. The common drink that thay usit was aill; and in time of weir, quhen they lay in thair tentis, thay usit bot water. * * Attoure thay had ay with thaim ane gret vessell, wrocht full of butter, cheis, mele, milk, and vinacre, temperit togidder; be quhillk thay saiffit thair lifis mony dayis fra extreme hunger, soukand the jus and humours thair of, quhen na vittallis, throw incursionis of ennimes, might be found."

This picture appears to us quite beautiful: now observe the opposite character of the men of the author's own day. "Bot now," says he, "I belief nane has sic eloquence, nor fouth of langage, that can sufficiently declare, how far we, in thir present dayis, ar different fra the virtue and temperance of our elders. For quhare our elders had sobriete, we have ebriete and dronkinnes; quhare thay had plente with suffeience, we have immoderat cursis with superfluite; as he war maist noble and honest, that culd devore and swelly maist: and, be extreme diligence, serchis sa mony *de-figat cours*, that thay provoke the stomok to ressave mair than it may sufficiently degest; throw quhillk we ingorge and fillis our self, day and nicht, sa full of metis and drinkis, that we can nocht abstene quhill our wambe be sa swon, that it is unabil to ony virtewis occupation. And nocht allanerly† may surfet dennar and sowper suffice us, above the temperance of our elders, bot als to continew our schamefull and immoderit voracite with duple dennaris and sowparis; throw quhillk the body is involtit with sic clowdis of fatnes, that, howbeit it be of gud complexion be nature, it is sa opprest with superflew metis and drinkis, that it may nother weild, nor yit ouir‡ the self; bot, confessand the self vincust, gevis place to all infirmities, quhill it be miserably distroyit, as apperis be sindry experience. For mony of our pepill, in remot and maist cauld region, are strikin oftymes with maist vehement fever, thair inwart bowellis blesand as thay war in ane ithand fire; quhillkis cumis of sic spicery and uncouth droggis, brocht out of remot cuntreis in this region. Utheris of thaim ar sa swolfin, and growin full of humours, that thay ar strikin hastily deid in the poplexy; and, howbeit thay recover for ane schort time efter, thay ar bot ane deid pepill; levand, and buryit in sepulture, havand bot ane shadow of life. The young pepill and barins, following thair unhappy customis of thair faderis, gevis thaimself to lust and insolence, havand all virtuous occupation and craftis in contemptioun; and, because thay ar lang customit and hanit thairwith, quhen time occurs of weir to defend the cuntre, thay ar sa effeminat and soft, thay pas on hors as hevvy martis;§ and ar sa fat and growin, that thay may do na thing in compare of the soverane manheid of thair elders."

With such a portraiture of gluttony before his eyes, the reader will be almost prepared to sanction a revival of the treatment with which inordinate eaters and drinkers were visited in the days when the generality were temperate. According to Belleden, "All dronkatis, glutonis, and consumers of vittallis, mair than was necessar to the sustentation of men, wer tane, and first commandit to swelly their fowth of quhat drink thay pleist, and incontinent thairafter was drownit in ane fresche river (!)"

The subject is worthy of a few concluding words from ourselves; but these must be of a serious nature. To speak the plain truth, we think with pain of the selfishness implied by such over-indulgences as those described, even where there is ample wealth to command them; for how many that starve could be succoured from the very superfluities of a modern banquet! It may be said that the luxuries of the rich do good to the poor, by creating employment. They certainly have this beneficial effect; but those who use the argument do not recollect that the amount of benefit produced by any distribution of money depends expressly on the nature of the employment on which it is spent.

* Rather.

‡ Overseas, or superintend.

† Only.

§ Dead cattle.

Funds expended in calling into existence some rare delicacy for the palate, or in inducing a farmer to part with his lambs before they are a month old, do little for the good of the poor, compared with what might be effected by the distribution of the same sums amongst tradesmen whose industry tends largely to the comfort of mankind. But, even passing from this question, it seems to us as if there were an impious disregard of the well-being of our fellow-creatures, in enjoying so large a proportion of the good things of the world, and making so merry over that inordinate share, by however fair means it may have fallen to us, when we well know how full the world is of want, and every pain and woe, which the very part that hurts ourselves might help to relieve, or which we at least should not mock if we lived more nearly by the golden rule of moderation. To a right feeling, it would appear, we think, but a sad enjoyment, which we knew, if under public observation, would be beheld with envy, longing, and howlings of indignation, by half-fed and half-cold thousands. Our philosophy on this point will probably appear absurd; and yet, strange to say, it is in perfect accordance with the whole strain of a Book much professedly revered, though we suspect seldom read aright.

WALKS IN THE BRITISH MUSEUM.

EGYPTIAN ROOM.

Third Notice.

It has been mentioned that convenient knives, for domestic and peaceable purposes, were a class of articles in which ancient Egypt was comparatively deficient. The people used no such instruments at table, and forks were equally unknown to them. The custom of eating with the fingers alone, however, it is well known, continues almost universal in the East up to this day, and we have seen an amusing account given of the distress of a high-bred European lady, whom the existing ruler of the very country under consideration had invited to dinner, and whose plate, in his desire to do her particular honour, he heaped with *pilau*, elegantly clutched from the main dish by his own vice-regal fingers. But we find ample proof, in the relics to be seen on the shelves of the Egyptian room, that the ancient dwellers on the Nile were by no means ill supplied with other table conveniences. In case R and others, there occur great varieties of spoons, the most of them found or recovered by the indefatigable Salt. Wood and metal are the most common materials of which these articles are composed. As to the forms of the spoons, we have here again a striking indication of that insuperable taste of the Egyptians for the fanciful and grotesque, which must have made their houses perfect museums of oddities, combining the elegant and the ludicrous almost in equal degrees. The bowls of the spoons are mostly of a circular and oval shape, but others are angular or nearly triangular, while others, again, stretch out into long narrow points. The handles, however, are the remarkable portions of these instruments, being carved into all sorts of animal shapes, real and imaginary, snakes and fishes, sphinxes and mortal men. It is to be feared that the taste of the Egyptians was too irregular to permit them to use uniform sets of these articles, otherwise we might have had some hopes of the discovery of a complete dozen, which would be invaluable. The handles of the Egyptian spoons are generally long in proportion to the size of the bowls, as our own are.

Beside these spoons are various cups, bowls, and saucers, of the kind used for drinking and other such purposes. The common material of these is earthenware, but many are formed of metal, alabaster, marble, and other substances of a finer kind. Their forms differ considerably with regard to depth and other peculiarities, and, no doubt, they were intended for and applied to uses corresponding to these different shapes. Spoons of polished ivory or burnished metal, and bowls or cups of alabaster or marble, would make a most respectable figure on a convivial board; and in looking at some of these articles, we are again necessitated to come to the conclusion, that, enlightened and domestically comfortable as we think ourselves, there have been tolerably enlightened and domestically comfortable people in the world long before us.

Turning for variety's sake from the side cases of the Egyptian room to the upright stands in the centre, which have top-cases secured by glass-plates, we find in these an immense collection of all kinds of jewellery, used for the adornment of the person. The enduring nature of the material has tended to the preservation of these relics in such quantities; and, really, rating it at the mere value of the bullion interspersed through it, the collection is of great worth. Finger-rings, earrings, necklaces, chains, and similar ornaments, are here in profusion, the component material being usually either the precious metals or the precious stones. To describe the forms of these articles is scarcely possible. The rings are mostly of gold, and vary in shape from the smooth plain hoop to the winding serpent, or to the circle with a broad signet, covered with hieroglyphics. In few instances, indeed, is any ring devoid of some fantastic animal figure, or without hieroglyphics. Of the ear-rings, which are commonly formed so as to hook together, nearly the same thing may be said. There are examples, also, of rings of silver, as well as of ivory and variously-coloured artificial substances, seemingly porcelain and glass; which articles appear to have been the adornments of the

poorer orders. The necklaces are exceedingly curious, consisting in some cases of continuous links of wrought gold, and in others of gold intermixed with precious stones or imitations of them, of a great variety of hues. Some of these necklaces are both massive and long, and once decorated, we may be sure, no mean persons. Other necklaces are chiefly of glass beads, closely resembling modern things of the same order. Of course, all sorts of shapes, known and unknown, appear on and about these necklaces and rings. But of all such figures, by far the most predominant is that of the venerable idol of Egypt, the *scarabæus* or *beetle*. There are actually whole cases of these beetles, or of gold and stones wrought into their forms, and these articles seem to have been suspended by chains, or otherwise worn about the person. A modern taste is utterly at a loss to conceive how any feeling but disgust could have been excited by having these crawling creatures or their resemblances stuck about one. At the same time, many a beau and belle of our day would be glad to display some of these rings and necklaces about their bodily frames, grotesque as are the disposition and invention of the figures thereon.

Numbers of the glass or artificial beads, and similar relics of Egyptian art, display such perfect imitations of precious stones, such as the amethyst, that excellent judges have declared our modern artists to be decidedly inferior, in this respect, to those of antiquity. The ingenuity of the Egyptian artists discovered the art of carrying colours, lines, or devices, laid on the exterior of glass, through the whole body and substance of it. This operation, on which the power of imitating precious stones in glass may be said to depend, was accomplished only through consummate patience, and the utmost nicety of handling; for it was by forming the imitative glass in parts, and uniting or cementing them together, that the desired object was attained of making an exterior streak or figure of any hue run through the body of the article. Suppose, for example, it was desired to make a coloured eagle appear equally on the exterior, interior, and in the very heart of the substance. The eagle, or the properly coloured glass representing it, being separately formed at first, required to be put into the substance of the article in layers or laminae, and these were fixed in their place by means of some flux. By breaking beads thus formed, these facts have been distinctly ascertained. The delicacy of workmanship requisite in such operations, must have been beyond conception. But on this point we have now said enough, although the subject is far from being an uninteresting one, particularly when we consider that this appears to be one of the points on which the world has made a retrograde movement.

The general subject of painting naturally occurs after such remarks on glass-painting, and we turn to case W of the Egyptian Room, where we find some small withered-looking slips of reed and wood, with a few small pots and coloured articles, known to be paints and painting implements. Several long, pointed, pencil-looking pieces of wood (without any thing, if we remember aright, like a brush among them), together with the aforesaid pots, which were not unlike modern articles for the same use, and several dull-hued pieces of blue, green, red, yellow, black, and white matter, are almost all that we have before us in connection with the art of painting among the Egyptians. The paints alluded to, or at least those used by the Egyptians generally, have been chemically examined in this country, and the green has been found to derive its origin mainly from oxidised copper; the blue from a species of pulverulent glass; the red to be an earthy bole; the black to be bone-black; the white a species of chalk; and the yellow an iron ochre. Alas! however, if we had reason to triumph for our friends of antiquity in the matter of the imitative glass, certain it is that the art of painting, considering that art as nature's imitress, was not one of the departments in which the Egyptians had attained to real excellence, although this arose, most certainly, from inveterate national prejudices rather than want of capacity. In outline-drawing they often excelled, but as for perspective, light and shade, or any harmonious blending of colours, these were things unknown to them, or never aimed at. Hence every painted relic of the country—and the number of such relics, exclusive of the fixtures in the tombs, is immense—presents the broad and glaring primitive colours unmixed and unsoftened on all occasions. The tops of the mummy-cases in the Egyptian Room will show this partly to the visitor, and if he examines copies of the Theban paintings, he will be more fully satisfied. Before leaving the subject of painting, it ought to be noticed that there is in the room of antiquities a small terra-cotta bottle or jar, very narrow in proportion to its length, and having a handle so formed, as seemingly to be intended for carrying on the thumb. This is understood to be a painter's water or gum-water bottle, from which he diluted his paints in the pot, as they required it. When we remember the carriage by modern painters of the palette upon the thumb, there seems a coincidence between the two applications of the little member, that shows how early and readily men in all

* There are in this part of the room two small paintings on wood, called portraits, which are from Egypt, but are held to be of the later or Grecian era. They cannot be regarded, therefore, as specimens of Egyptian art, but if they were, they are such odd-looking chalky affairs, and the faces so little flattering to mortality, that no nation could be adjudged portrait-painters on their account. But, after all, age must be taken into consideration.

situations hit upon the plans most convenient and suitable for their purposes.

Relics of writing implements occupy the same shelf with the preceding articles. We find among these one or two rather long, but slender and pointed reeds, which constituted the pens of three thousand years ago. The tablet or inkstand, also, is a sort of box with divisions, the ink being probably held in a bottle or little earthenware article. What was the exact nature of the ink commonly employed, it might be difficult to say. Diluted black paints might be used, or possibly some dye manufactured much like ours, for other circumstances prove that the people of Egypt were not unacquainted with the properties of the acids, and of the metallic oxides, in changing and producing colours. The paper of Egypt is no matter of conjecture. Visitors to the Museum are not usually allowed to examine the papyri, which are things too delicate for the handling of the uninitiated. But it is right, nevertheless, to give some account of these papyri, which, with the exception of the sculptured and painted records, are the only written memorials which have descended to us from that distant age. These papyri are composed of the heart of the stalks of a marsh-plant called the papyrus, which grows to the height of fifteen feet, and is two or three inches in circumference. The heart of the plant is cut into longitudinal slices, which are laid on a board together, glued at the edges, and well pressed. When dry, this substance is polished, and forms, or formed, Egyptian paper. On it were delineated hieroglyphics and other varieties of writing; and of those papyri that have come down to us, most have been found in the mummy-cases beside the preserved bodies. When found, they are in the shape of rolls, or rolled-up sheets, of a withered dusky hue. From time to time, great numbers have been brought to Europe, and much has been expected from them, but this expectation has scarcely been fulfilled. As might have been anticipated from their age and other circumstances, many of them prove illegible, through their brittleness, and of those that have been deciphered, the contents have turned out of little historical interest. We may wind up this notice of the mummy-papyri by mentioning that the writers of them, namely, the regular scribes who went here and there in a professional capacity, like notaries to a deathbed, had a custom worthy of being noticed among other evidences that nothing is new under the sun. It might have been presumed that some slender clerk of no distant date was the first to hit upon the ingenious expedient of disposing of his pen, at leisure moments, by sticking it behind his ear. Alas, for novelty! a scribe in one of the Theban paintings is to be seen in the same elegant circumstances.

There are many specimens of baskets, as has been already mentioned, among these Egyptian relics. The majority of these are understood to be made of the twisted and interlaced date-tree leaves; others, again, seem constructed of the same portions of the Theban palm. In many instances, whatever be their material, these baskets are so neatly and firmly wrought, and altogether so handsome, that it is with difficulty one can admit the idea of their being some 2000 or 3000 years old. The tiniest and most finical of serving-dauncels would be proud to visit the family-grocer's with some of these receptacles on her arm. Several are provided with handles, formed of the same plants as the main article. From these specimens, we may readily conceive that the handsomest reticules were at the service of the Egyptian ladies, if they chose to use them, of a woven or interlaced fashion. But, after all, basket-weaving is at best a manufacture of simple or savage life, and the very blind can attain to great, if not to the greatest perfection in it. Therefore, pretty as these baskets are, one cannot found upon them as any striking proofs of the high advancement of Egyptian art.

THE EVENING BEFORE THE MARRIAGE. FROM THE GERMAN OF ZSCHOKKE.

"We shall be so happy with one another!" said Louisa Mowbray to her aunt the evening before her marriage, and, as she spoke, the colour mounted to her cheek, and her eyes beamed with inward rapture. It is not hard to guess when a bride says so, who it is she means. "I have not a doubt of it, my dear Louisa," replied her aunt; "only take care that you continue so." "Oh, who could doubt it for a moment? I know myself, and if I am not good, my love for him will make me better. We love each other; and so long as we do that, we cannot be unhappy. Our love will never grow old."

"Ah," sighed her aunt, "you speak like a girl of nineteen the day before her marriage, with the flush of wishes fulfilled, and of fair hopes and anticipations strong upon her. My dear child, mark my words: even the heart grows old. The day is sure to come when the magic of the senses dies away; and when that spell is broken, then for the first time does it appear whether we are really worthy of being loved or no. When custom has made the brightest charms common, when youthful bloom has faded, when the shadows of life have gathered thickly over the light of home, then, and not till then, can the wife say of her husband that he deserves to be loved, or the husband of the wife that hers are no transitory graces. Indeed, there is something ridiculous to my ears in protestations of this sort on a wedding-day."

"I understand you, aunt. You mean to say that it is only our mutual virtues, that in after-years can give us worth in each other's eyes. But is not my Alfred—for I can't lay claim to any thing for myself, but the

wish to do right—is not my Alfred the worthiest, the noblest of all the young men in the whole town? Are there not in him the germs of every noble quality that can lead to happiness?"

"I agree with you entirely, child. You have the germs of good qualities, too, as well as he—I may say that much without flattery. But, my dear, they are no more than germs, and require much rain and sunshine to ripen them into maturity. No blossoms are more deceitful to the hope than these. We never know what soil they are rooted in. Who knows the mystery of the heart?"

"Why, aunt, you quite frighten me."

"So much the better, Louisa. A little trepidation the day before marriage will do no harm. I have a sincere love for you, and will therefore tell you my mind frankly. I am none of your frumpish old aunts. At seven-and-twenty, one is not apt to have turned a puritan, but still looks out upon life with a tolerably cheerful eye. I have a model of a husband, and I am happy. Therefore I have some right to speak to you in this way, and to put you up to a secret, which most probably you are ignorant of, which indeed a pretty young girl runs little chance of being told, and most young men care little to hear; and yet, for all that, it is the one great requisite at every fireside, for from it alone can spring enduring affection and indestructible happiness."

Louisa grasped her aunt's hand in both of hers. "Dear aunt, you must be right; I believe every word you say. What you mean is, that lasting happiness and love can never be secured by any merely casual or transitory charms, but only by those virtues of disposition which we carry into the married state. They are our best dowry; they never grow old."

"Not exactly, Louisa. Even virtues may grow old, and with old age become displeasing, quite as much as personal attractions."

"Why, aunt, how can that be? Tell me one virtue that could become displeasing with the lapse of years."

"When it has become displeasing, we call it a virtue no longer, just as we call a pretty girl no longer pretty, when time has changed her into the sober mother of a household."

"But, aunt, virtues are not mere things of earth."

"Why, not exactly."

"How can meekness or gentleness ever become displeasing?"

"Whenever years make them appear effeminate weakness."

"And manly firmness?"

"Becomes offensive coarseness."

"And modesty?"

"Sheepishness."

"And noble pride?"

"Simple conceit."

"And readiness to oblige?"

"Fawning and servility."

"Why, aunt, you almost make me angry with you. My future husband never can degenerate in this way. One virtue he has, which must always keep him right—his high-toned sentiment, his ineradicable feeling for every thing which is great, and good, and beautiful. And this fine sensibility for every thing noble lives within my bosom, as well as in his. It is to us an in-born hostage for our happiness."

"And if it should happen to grow old with you, it would become nauseous sentimentality; and sentimentality is the very mischief. Not that I would have you without sensibility, but heaven keep this Grace from changing into a squabbling old woman. Do you know the Countess Hofingen?"

"She who was separated from her husband last year?"

"Do you know the real cause why they parted?"

"Every body has some different story about it."

"You shall hear how the thing happened. I had it from herself. The story is at once laughable and instructive, and comes quite pat to what we were talking of."

"Hofingen and his wife were looked upon by every body as the most affectionate and enviable of couples. Their marriage was the result of a passion which had been the growth of years. Their love was a perfect mania. They were formed for each other, beautiful, and good, and ardent, with the most admirable harmony in all their views and wishes. The whole world was agog about the scene that occurred, after they had been formally betrothed, when some quarrel between their parents knocked the marriage arrangements entirely on the head. The lady pined to a shadow, and her passionate lover threatened to blow his brains out, or swallow a bottle of prussic acid at the least. Suffice it, that to save the young countess's life, and prevent him from committing some such act of desperation, the old folk had nothing for it but to make up their quarrel, or seem to do so, whether they did or not. This restored the lovers to their senses; but no sooner was the lady out of danger, than the old folk split again, and were for putting off the match for a couple of years more. The result may be guessed. One night the devoted pair packed up their travelling gear, and, borne on the wings of love, in the shape of a chaise and four, crossed the borders, got married; came back as man and wife; and from that moment a whole heaven of rapture seemed to have come down upon the earth."

Henceforth nothing could have gone more smoothly than did the union of this devoted pair. It was peace and concord in the abstract. From morn till noon, from noon till dewy eve, the young people seemed to

think of nothing but how to please one another. The first year found them inditing poems to each other, the sweetest, the most passionate things in the world; winter and summer bloomed alike in perpetual flowerage; not a stick or stool about the house but was endeared to them by some delightful association. The second year, indeed, these enthusiastic outbursts of feeling had softened down a degree; but still, in ball or fête, at tea-drinking or conversazione, they saw, they sought, they lived but for each other. The third year, this amiable weakness was dropped in company, but at home they were still the same. The fourth, they appeared to have got rid of the first all-absorbing thrall of love, so far at least as to be able to go out into society of an evening alone, she one way, he another, with tolerable comfort to themselves. But the joy of meeting was only so much the more entrancing. The fifth, the count felt himself able to go from home for a week or two, without having his heart shattered to fragments, or his wife going into fits at parting. But the letters that passed in the meantime! Why, Eloise with the pen of Alexander Pope wrote not more movingly, nor with a warmer passion. The sixth, they had at last become sufficiently rational to allow a separation of some weeks to pass over, merely with the interchange of one or two friendly letters. In the seventh year, they became conscious that people could really love each other, without the necessity of renewing protestations of attachment in words or writing from morning till night. Their bliss had reached its summit, because they now felt towards each other the quiet confidence of considerate friendship. In the eighth, they had so far shaken off the egotism of love, that they had some feeling to spare for the rest of the world, and did not live solely and simply for each other, as if they were the only folks living, and all the rest of mankind were but galvanised puppets upon the stage of life. In the ninth, they were the most amiable, the most beneficent, the most delightful, kind creatures you can imagine, abroad as well as at home. In the tenth, they were very much like what we other children of mankind, such honest souls, at least, as are among us, usually are, when we have had ten years' experience of each other in the wedded state.

True it is, they had now grown ten years older; but so had their love, and, alas! their virtues too. Both had become a proverb in the town for their sensibility of heart, and every body loved them for it.

Well, in the first year of the second decade of their marriage, they both made the remark, that their passion was no longer so violent as it used to be. This they thought quite natural. A person can be in love, without making a fuss about it. Next year they discovered in one another a number of little weaknesses, which the mantle of love had hitherto concealed. What of that! They forgave them, and each endured the faults of the other with amicable forbearance. In the third, they would be giving one another occasional hints of the most delicate kind—but these broke no bones between them. And then, indeed, if one felt in any way hurt at the untowardness of the other, there was not wanting the assurance that the offender would willingly do the most amiable penance. In the fourth, however, each was inclined to think that the penance-doing work fell rather too often to his or her share; and occasional suspicions crossed the minds of both, that one was disposed to forgive himself or herself every thing, and the other nothing. In the fifth, a great many little annoyances occurred, which were apt to be remembered. In the sixth, they began to measure their words towards one another, so as to keep clear of discord. In the seventh, there were a good many misunderstandings, and nothing more common than for one to be piqued at the expressions of the other. This, however, they explained into a proof of love and devotion; no enemy's sword cuts so deep as the frown of one that is dear to us. In the eighth, these little bickerings grew more frequent, but these nobody minded. In the best-assorted matches such things will happen. They would be sulky towards each other for a day or two, and then make it up again. In the ninth, their mutual sensibility brought them to a prudent resolution to tolerate extreme bursts of emotion in each other. 'You, my love,' said the count, 'are sensitive and irritable—so am I. This does not do. You may be violent, so very possibly might I. To avoid disputes, I will allow you to do just as you please; let me do the same. In this way, my love, we shall live pleasantly together, without annoyance to ourselves. We love each other, but, my dear, it will never do to worry each other to death with our love.' So, too, thought the countess. Henceforward they rarely met but at table. Neither inquired where have you been, or where are you going! Peace was restored, and on this courteous footing they lived in harmony and comfort. And if ever one was piqued at any thing the other said or did, something handsome and complimentary passed, and so they parted.

One night during the twentieth year—you have thus the history of twenty years—after their return from the theatre, they had supped together, and sat chatting agreeably by the fireside. They were still full of the emotions which a play of Iffland's had called up within their susceptible bosoms. The bliss of wedded and domestic life, the delineation of which upon the stage had enraptured them, seemed to be renewed with all its force in their own persons.

'Ah!' said the countess, 'all very good if one were to be always young!' 'Do not complain, dearest! Where is there a woman keeps her looks as you have

EDINBURGH JOURNAL

done! I see no difference in you to-day and the night before our marriage. Some little caprices! Well, they are easily put up with. Our union is certainly one of the most enviable upon earth. If I were unmarried, and to see you, I would offer you my hand in preference to every body.' 'Vastly well turned,' replied the countess, with a sigh. 'But, my dear, just think—twenty long years! What am I now! what was I then?' 'A charming wife now, sweet—then a charming girl. I would not exchange the one for the other.' He rose, and pressed her to his bosom with a kiss. 'We should be happy, quite happy. But there is one thing wanting, dearest, to complete the felicity of our union.' 'I understand—a child, to inherit your grace and virtue. But,' added the count, while he kissed his lady's hand, 'you are only eight and thirty—I scarcely forty—who knows, perhaps —' 'Oh, how I should be delighted! It is very true that a single child gives quite as much sorrow and anxiety as pleasure. The slightest mishap may snatch him from us again. But, then, a couple of children.' 'You are right. And not two, but three. For with two, if one were to die, we should just be in the same state of anxiety as before. I feel that heaven will listen to our prayers. We shall yet see these charming little ones sporting about us.' 'My love,' said the lady, with a smile, 'that would be almost too much. It would only involve us in a fresh dilemma. For instance, if they should be sons?' 'Well, and if they were, we have an income of some twelve thousand pounds; enough surely both for ourselves and them. The oldest should have a commission—the second a diplomatic appointment. These would both cost a trifle—very true—but then they would be sure to rise. We have connections, rank, and influence.' 'But you forget the youngest, love!' 'The youngest! not a bit. He shall be bred for the church, and cannot fail of falling into a prebend.' 'What! a son of mine a priest! No, indeed; no good would come of that.' 'No good! And may I ask, why not! He may become an abbot, bishop, archbishop, madam.' 'He may do no such thing! I may prove the mother of a monk, and see my son with a shaven crown and cloister frock. I wonder such a thought could ever enter your head. If I had a hundred sons, I would not permit it.' 'You are in a strange humour for once, wife dear. But for all your spleen against the church, I know you will give in to what is both for his happiness and ours.' 'I tell you, and tell you again, I will never do any such thing. Call it a whim, an humour, what you like. You have an humour to be lord supreme; but you will please to remember that a mother may be allowed to put in a word in such a case.' 'Indeed, she may not. It is entirely the father's look-out. And I shall let it be seen, whenever the occasion requires it, that my will, and mine alone, shall have the whole disposal of the matter.' 'Good heavens! I am quite aware, sir, that you are my lord and husband; but, sir, I have not the honour to be your maid-servant.' 'Nor I your page, my Lady Countess. I have given way to you in every thing, perhaps more than I ought. But cheerfully as I submit to your caprices, remember there are such things as whimsies, that may be too absurd.' 'I am much indebted to you for the lesson, of which you have just given me a plain practical illustration. I think I know, sir, who has given way most. For years I have put up with the improprieties of your conduct, and magnanimously forgiven them, more as the faults of intellect and education than as errors of the heart. But the patience of heaven wears out at last.' 'There you are perfectly correct. Mine has been preciously tried, madam, for many a day, by your whims and fancies; and you may thank your stars, madam, that I did not shake off the yoke before the year and day was out; for, sooth to say, there is nothing very creditable in being the obedient slave of your thousand and one absurdities. I must give you a piece of my mind, madam, for once.' 'And if I had wished to give you a piece of my mind, sir, you should have known many a day ago that you are a proud, self-seeking egotist, whom it is impossible to put up with; a heartless puppet, that is always talking about feelings, for the same reason that people make the greatest vaunt of what they do not possess.' 'Indeed! that is the way, I presume, you make such a fuss about your acuteness, and your seeing farther than your neighbours. You may impose upon others, madam; thank heaven, I have long been undeceived. Virtue with you is nothing at bottom but womanish grimace. Your mawkish parade of intellect is more and more distasteful to me, the more I know what you really are. But that I did not like to wound your feelings, the fact is, I would have sent you back to your family long ago, as the only chance for peace left me.' 'You have just anticipated my wishes. A stiff tiresome egotist like you is not the sort of person to make any woman of intellect happy. And after such a declaration, I would have you to know that nothing could afford me greater pleasure than to be rid of you at once.' 'Thank goodness! the murder is out at last. I take you at your word, and could not wish myself better off. Adieu! and pleasant dreams attend you. To-morrow shall see the business concluded.' 'The sooner the better, my lord!'

And so they parted. Next day a notary and witnesses were sent for; the deed of separation was drawn up, and subscribed by both parties, in spite of the remonstrances of friends and relations, male and female, nay, even persons of the first quality. Since then, they have lived apart. Thus was a connection of long standing, and to all appearance a happy one, sud-

denly broken. The ridiculous dispute about the future destiny of three sons, who had not even an existence, snapped the thread that looked as though it would have bound them for ever. And you will remark, that, for all that, the count as well as countess are both of them very pleasant persons. You can charge them with no bad quality, but only with certain foibles, such as we all of us have."

"Do you call this story laughable, aunt?" said Louisa, with tears standing in her eyes. "It has made me quite melancholy. I now comprehend how it is that the marriage of even excellent people may by little and little become very unhappy. Give me some consolation, for, unless you do, you will have made me miserable to no end. I never would venture to look upon my future husband without alarm for what might happen. Think of the horror of such a fate!"

"Well, girl, how would you propose to avoid it?" inquired her aunt.

"Oh, aunt, if I were never to grow old!—then I might be certain of binding my husband to me for ever."

"You are greatly mistaken, my dear child. Though you were always to be as fair and beautiful as you are this day, yet would the familiarity of years render your charms in the long-run a matter of indifference in your husband's eyes. *Habit* is the mightiest magician in the world, and one of the most beneficent of the household fairies. She makes the most beautiful and the most repulsive object alike common: say we are young and grow old, habit prevents the husband from noticing the change. Reverse the case, and suppose that we were to continue young, and he to grow old, mischief might be the result, from the natural jealousy of our time-stricken lord. Things are better as they are. Think of your becoming an aged grandam, and your husband a blooming youth; how would you reconcile yourself to that?"

Louisa was puzzled. "Really I do not know."

"But," continued her aunt, "I will communicate a secret to you, which —"

"What! that," interrupted Louisa, "that which I have been dying to hear!"

Her aunt continued. "Give me your best attention. What I am about to tell you I have myself tried and found to succeed. It consists of two parts. The first part of my plan for making marriage happy is in itself an infallible preventive against the very possibility of dissension, and could not fail ultimately to make even the spider and the fly the best of friends. The other part is the best and surest means for the preservation of womanly grace."

"Ah!" cried Louisa.

"For the first part of my plan, then. Take your bridegroom, the first hour after your marriage that you are alone, and require from him a vow, and give him one in exchange. Promise each other solemnly, not even in the merest jest to wrangle with one another, or to interchange words of raillery or reproach. Never! I tell you, never! Squabbling even in jest, words of the merest banter, by repetition become downright earnest. Mark that! Further, promise with all the seriousness your heart is capable of, never to have a secret from one another, under no pretext, under no excuse whatever. Continually, yea, every moment, you ought to see clearly into each other's breasts. If one of you have done wrong, let not a moment be lost till it is frankly confessed; though it be with tears, confessed let it be. And so as you have both of you no secrets from each other, all that concerns your home, your mutual intercourse, your own hearts, is and may be kept a secret from father, mother, sister, brother, aunt, and all the world. Yourselves two, under God, fashion henceforth your own calm world. Every third and fourth person you introduce there, would but make division, and stand between you and your love! This may not be. Promise that. Renew the vow upon every temptation. You will find your account in it. So will your souls grow as it were together, so will you two become but one. Ah, if many a young couple had but known this little piece of worldly wisdom, and made a proper use of it, how many a marriage would be happier, than, alas, it is!"

Louisa kissed her aunt's hand fervently. "I feel this must be done. Where it is not, married people, although united, are still two strangers, who know nothing of each other. It ought to be—without it there can be no happiness. And now, aunt, the best means for the preservation of womanly grace!"

Her aunt smiled, and went on. "We cannot disguise from ourselves the fact, that a handsome man pleases us a hundred times better than a plain one; and men feel just the same way towards us. But what we call handsome, what properly pleases us in men, and men in us, is not merely head and hair, symmetry or complexion, as in a picture or a statue: it is the characteristic expression, the soul breathing outwards, which charms in word and look, in earnestness, in sorrow, and in joy. Men idolise us, in proportion as they discover in us those virtues of the mind which our look gives promise of; and we find an evilly disposed man repulsive, be he never so handsome or good looking. Thus, then, a young girl, who would preserve her beauty, must look to the graces of her mental nature, those qualities of disposition, those virtues, in short, by which she fascinated her lover. And the best of all means for preserving virtue, so that it never alters, but remains for ever young, is a religious habit of thought and action, a walking in the sight of heaven, with a mind pure, peaceful, and kindly, towards all mankind."

Look you, dear," she continued, "there are virtues which are begotten of mere worldly prudence. These grow old with time, and they change, because, with the vicissitude of circumstances and inclinations, prudence changes her modes of action, and because prudence does not always grow with the growth of years and passions. But religious virtues cannot change, because our God is evermore the same, and because that eternity is evermore the same, whither we and those we love are journeying. Maintain an innocent, pious frame of mind, and that soul-inspired beauty will always be yours for which your bridegroom worships you to-day. I am no Puritan, but simply your own aunt of seven-and-twenty, that loves you dearly. I am fond of dancing; I like to look smart; I love a joke; but for that very reason I say to you, be an affectionate, gentle-hearted, Christian woman, and you will be beautiful as mother and as grandam!"

Louisa threw her arms about her aunt's neck, and testified her thanks by an emotion too deep for utterance.

THE POETRY OF SIR WILLIAM JONES.

THE accomplished scholar and jurist, Sir William Jones, has already found a place in the biographical columns of the present work. From the brevity, however, indispensable to such sketches of personal history, it was impossible to enter on that occasion into any detailed account of the particular works on which his reputation is founded, or to do more, in truth, than give a mere enumeration of their titles. His acquisitions as a linguist, from the period of boyhood till his death, were so rapid and numerous, and the displays resulting from each new accession of knowledge followed so closely upon one another, that a minute account of his productions would of itself occupy a very large space. We do not propose to enter on such a task here, but simply to consider Sir William Jones in his character of a poet, as well as of a translator of poetry.

Sir William evinced a taste for poetry at a very early age. His widowed mother fortunately possessed the means of educating him respectfully, and in 1753, when arrived at the age of seven, he was placed at Harrow School. In his ninth year, the juvenile poems of Pope excited in him the spirit of emulation, and he began to exercise his poetical talent in imitations of that author, and of Dryden, his two chief favourites. Subsequently, when studying the classics, he produced translations of some of the best known minor pieces of the ancient poets. A verse or two from an imitation of the Fourteenth Ode of Horace (Book Second), may be presented as a specimen of the skill and ease in composition which he had attained at the age of fourteen:—

How quickly fades the vital flower!
Alas! my friend, each silent hour
Steals unperceived away:
The early joys of blooming youth,
Meek innocence and dove-eyed truth,
Are destined to decay.
Can zeal dearer Plato's wrath restrain?
No! though an hourly victim stain
His hallowed shrine with blood,
Fate will recall her doom for none;
The sceptred king must leave his throne,
To pass the Stygian flood.
Our house, our land, our shadowy grove,
The very mistress of our love,
Ah me, we soon must leave!
Of all our trees, the hated boughs
Of cypress shall alone diffuse
Their fragrance o'er our grave.

This is composition of no ordinary kind for a boy of fourteen, though not otherwise very remarkable. Two years later, Jones wrote the principal portion of a poem of some length, published afterwards under the title of *Arcadia*, and distinguished by the tasteful elegance of its style. From this time forward the subject of our notice continued at intervals to cultivate his poetical powers, by rendering into English different pieces from Greek and Roman writers, until his acquisition of the Arabic and Persian tongues gave a new direction to his talents. He was only twenty when he had made such proficiency in Oriental literature as to receive an offer (which he declined) of the post of state-interpreter for Eastern languages. When master of these tongues, he began to translate freely from them, both in prose and verse: The poetry of the East certainly presented to him a far more congenial field for the display of his powers than the writings of Greece or Rome. His own style, perhaps from his great philological knowledge, was flowery, verbose, and epithetical in the highest degree, and the Orientals were distinguished by the like characteristics. This similarity led to his unbounded admiration of the Eastern poets, and rendered him also a fit expositor of their beauties. For example, never did poet find apter translator, than Hafiz, the Persian, has met with in the case of the following song.

A PERSIAN SONG OF HAFIZ.

Sweet maid, if thou would'st charm my sight,
And bid these arms thy neck enfold,
Teat rosy cheek, that illy hand,
Would give thy poet more delight
Than all Baccara's vaunted gold,
Than all the gems of Samarcand.
Boy! let yon liquid ruby flow,
And bid thy pensive heart be glad,
Whate'er the frowning senolds may:—
Tell them their Eden cannot show
A stream so clear as Roonabad,
A bower so sweet as Meccelay.

O! when these fair, perfidious maids,
Whose eyes our secret haunts infect,
Their dear destructive charms display,
Each glance my tender breast invades,
And robs my wounded soul of rest,
As Tartars seize their destined prey.
In vain with love our bosoms glow:
Can all our tears, can all our sighs,
New lustre to those charms impart?
Can cheeks, where living roses blow,
Where nature spreads her richest dyes,
Require the borrowed gloss of art?

But ah! sweet maid, my counsel here—
(Youth should attend when those advise
Whom long experience renders sage)
While music charms the ravished ear,
While sparkling cups delight our eyes,
Be gay, and scorn the frowns of age.

Go boldly forth, my simple lay,
Whose accents flow with artless ease,
Like orient pearls at random strung.
Thy notes are sweet, the damsel says:
But oh! far sweeter, if they please
The nymph for whom these notes are sung.

Paraphrasing, to which his choice of Pope as a model, and still more his own consummate command of language, made Jones especially liable, has not been avoided in this version from Hafiz, but the expansion has been executed so much in the spirit of the original, that the blemish is almost obliterated. But the effect of this same paraphrastic propensity was most destructive when Jones attempted to handle the poems of the Greeks, so remarkable for their nervous simplicity. The same was the result of his attempts to translate such writers as Petrarch, as any one may see by comparing Jones's version of one of that writer's canzoni with the exquisite translation of a late writer, Leigh Hunt. The canzone is that beginning "*Chiare, fresche, e dolçe acque*." But while Sir William failed in rendering into his native tongue those compositions of which the strength lay in simplicity, we repeat that he was admirably fitted for the translation of oriental verse. His own taste seems to have told him so, for the greater part of his poetical works consists of versions or imitations of the Eastern bards, such as hymns to Durga, Indra, Narayana, Laeshmi, and other Indian divinities, with allegorical tales, as the Seven Fountains, the Enchanted Fruit, and others. The imagery of these is most sparkling, and the language polished and harmonious, though the whole, it must be admitted, is nearly a dead level, like a garden in the old clipped Dutch taste. The following lines from the Seven Fountains may serve as a specimen:—

The wondering youth beheld an opening glade
Where in the midst a crystal fountain play'd;
The silver sands, that on its bottom grew,
Were strewn with pearls and gems of varied hue;
The diamonds sparkled like the star of day,
And the soft topaz shed a golden ray;
Clear amethysts combined their purple gleam
With the mild emerald's sight-refreshing beam;
The sapphire smiled like yon blue plain above,
And rubies spread the blushing tint of love.

As a fair example of Jones's original poetry of the graver cast, the reader may be presented with an ode after the manner of Alcæus the Greek.

What constitutes a state?
Not high-raised battlement or lofty mound,
Thick wall or moated gate;
Not cities proud with spires and turrets crowned,
Not bays and broad-armed ports,
Where, laughing at the storm, rich navies ride,
Not starred and spangled courts,
Where low-browed baseness waits perfume to pride.
No:—MAN, high-minded MAN,
With powers as far above dull brutes endued,
In forest, brake, or den,
As beasts excel cold rocks and brambles rude;
MAN, who their duties know,
But know their rights, and, knowing, dare maintain,
Prevent the long-armed blow,
And crush the tyrant while they rend the chain.
These constitute a state,
And sovereign LAW, that state's collected will,
O'er thrones and globes elate
Sits Empress, crowning good, repressing ill.
Smitten by her sacred frown,
The fiend, *Dissension*, like a vapour sinks,
And e'en th' all-dazzling crown
Hides his faint rays, and at her bidding shrinks.
Such was this heav'n-loved isle,
Than Lesbos fairer and the Cretan shore.
No more shall Freedom smile?
Shall Britons languish, and be men no more?
Since all must life resign,
Those sweet rewards, which decorate the brave,
'Tis folly to decline,
And steal inglorious to the silent grave.

Upon the whole, although the verses of Sir William Jones must ever form agreeable and intellectual reading, both on account of the beauty of the language, and of the virtuous sentiments conveyed in them, yet they certainly are not of the stamp to entitle their author to a place among the true poets of his country. What might be the exact quality necessary for this end, in which his most accomplished mind was deficient, is a thing not easily determined. His genius, obviously, was not intended, and to this defect some weight must be ascribed. Be this as it may, that essential element in the poetical constitution, which appeared so vividly (to quote a striking example) in the youthful Keats, and which cannot be defined better, perhaps, than by calling it a power, unpossessed by common men, of instantaneously finding a new similitude in nature for every imaginable thing, does not seem to

have entered into the composition of Sir William Jones's mind. The arrangement of old images and old expressions in novel and pleasing forms, constituted the extent of his poetical abilities. He appears, in truth, to have had no higher aim, and this was doubtless attributable in part to the vitiated poetical taste of his times.

Sir William died in India at the age of forty-seven, while engaged in the laborious task of preparing a Digest of the Laws of Hindostan—a task that would have conferred on him a nobler immortality than even that which poetry can bestow.

THE NATURAL RESULTS OF STRIKES.

It never seems to occur to the promoters of violent combinations for higher wages among the working-classes, that the employers have any reasons for not yielding to their demands, beyond a mere desire of getting work done as cheaply as possible, in order that they may have the greater profit to themselves. A more liberal consideration shows the case of the employers to be very different. In all departments of trade, they are exposed to rivalry both at home and abroad. They are pressed upon, in various respects, to meet the demand for low-priced goods, and to compete with each other in the common market of the world. Each, therefore, is under what we may call an imperative law of his condition, to try to get his articles produced at the lowest possible rate. Such a rivalry is very apt to depreciate the intrinsic value of goods (in fact, it is injuring the character of our manufactures), and is constantly acting on the wage standard. *If there were only a limited number of persons born or belonging to the working class, in all parts of the world, then it would be impossible for this rivalry to undermine the standard of wages; but this is not the case.* In most countries, there are hosts of persons who are anxious for employment, and they always find some one to pay them wages proportionate to his means, and to their numbers. Others are compelled, in self-defence, to follow his example, and thus wages are reduced.

Passing over the extreme tyranny which all combinations bear in their very front, it is of importance to show that they are calculated to prove injurious to the actual promoters of them in the long run. Violations of the natural order of things rarely, if ever, go unpunished; and we have not here any exception to the rule. Whenever an employer feels that he is placed at a disadvantage by the constrained payment of an over-high rate of wages, or when he feels that his property and his person are unsafe, he is, of course, uneasy, and resorts to various remedies for his relief. He proceeds with his concern to some other place, where he can be more secure, and work to advantage—or he endeavours to supersede manual labour by the introduction of inanimate machinery into his works—or he ceases to labour altogether, and lives on the fruits of his former industry. If he do none of these things, but, with his fellow employers, submits to the exactions of the unionists, then the chances are that the trade falls off, and ultimately leaves the country. These are not chimerical results. They are at this instant in active operation. The populous towns of Manchester, Ashton, &c., in Lancashire, owe a great portion of their prosperity to the early destruction of machinery at Blackburn and other places. Norwich, once a great seat of the camlet-manufacture, has been in a great measure crippled of that branch of trade by certain towns in Yorkshire, where the manufacturers were better protected from violence; indeed, if it had not been for "strikes," Norwich would at this day have been one of the largest manufacturing towns in the kingdom. Similar injuries have been done to many other towns. When, however, a branch of manufacture is removed only from one town to another, the unionists may follow it. True, they sometimes, from the wretched state of our general police, are able to pursue and molest their victims in whatever locality they may settle. In such cases, the effectual remedy lies in removal to some foreign country, where the unionists cannot possibly exert any influence.

As this paper meets the eyes of thousands of working men in all parts of Britain, we are anxious to put before them a plain statement of what is now the obvious result of the annoyances which trade has experienced from combinations and combinations during the last ten or twelve years. It is most important for the interests of working men that they should be aware that various branches of manufacture (not, it is true, entirely, but in a great measure, from this cause) are rapidly departing from the united kingdom. Every traveller in France, Belgium, Germany, and Switzerland, concurs in representing manufactures as rapidly increasing in these countries, and thus taking bread from the mouths of the labouring classes in England. Mr E. Tuffnell confirms these representations by the following statement of facts which had come to his knowledge, in the course of his inquiries as one of the Factory Commissioners—a statement which we derive from the first report (just published) of the Constabulary Force Commission, and which cannot be too earnestly read and reflected on by the working men of this country.

"An evil of far more serious import to the nation, is when the manufacture, instead of changing from one part of the country to another, leaves it altogether, and takes refuge in foreign parts. This has actually taken place in some instances, and the rapid increase of continental rivalry, by teaching foreigners to adopt

our habits of industry, and our improved machinery, daily renders it easier for them to supplant us in the market. It is obvious, indeed, that if this effect has not more generally followed, every additional attack on the profits of the home manufacturer must have this tendency, and augment the chances of foreign products successfully competing with British. In 1820, a Glasgow cotton manufacturer emigrated from that city, and established a factory at New York, that he might conduct his business free from those interruptions to which he was subjected in this country from the strikes among his men. The conduct of the Sheffield workmen already threatens the extinction of the trade of that town, and it is passing over to our French and German rivals. At present the same labour in the manufacture of saws which cost 15s. or 20s. at Sheffield, can be done for 1s. 3d. at Molsheim, in the neighbourhood of Strasburg. The consequence is, the exportation of this article to the Continent, which was considerable some years ago, has almost wholly ceased: many other of the Sheffield productions have shared the same fate; and America is almost the only market that is left for the sale of the manufactures of that town. The condition of a large proportion of the Sheffield operatives is far worse with respect to comfort than at any preceding period, and the town exhibits the extraordinary spectacle—the inevitable result of successful combinations—of high wages, a decaying trade, and a destitute population. The business that remains is now dependent on our friendly relations with the United States; war or the policy of a tariff may equally extinguish it; and should that happen, the Sheffield workmen may perhaps at length learn, amidst unavailing regrets, that the question has not been whether they shall get high or moderate wages, but moderate wages or none at all. An instance of transference of a manufacture to the Continent, in consequence of strikes, has lately occurred in the woollen trade. The workmen in a large cloth-dyeing establishment in Yorkshire turned out for an advance of wages. It happened that the firm were large exporters of finished cloth to Germany, where they possessed a small dyeing factory, of which, however, little use was made. The proprietors, on the stoppage of their business in England, were induced to try the experiment of sending the greater part of their cloth, in a white state, to Germany, and dyeing it there, where they could be free from the dictation of trades' unions. It is but fair to add, that other causes may have contributed in inducing the firm to try this new speculation; among others, the high duty on drugs in England, and the low duties on the importation of undyed cloth, as compared with dyed cloth, into Germany. The experiment not only answered expectation, but many other unlooked-for advantages resulted from the change. A saving was made in the expense of insurance, as the article was less valuable when in course of transit: there was also less risk of its being spoiled by sea-water, as the subsequent dyeing remedied any damage it might sustain from this cause. Consequently, the proprietors in question have been transferring their dyeing business to Germany, carrying their skill and experience with them; large additions have been made to their foreign factory; and whereas, before the strike, they did not export above 500 pieces of undyed cloth weekly, they now send from 1000 to 1200 in the same time. As increased profit has attended this change in the locality of their dyeing trade, it is clear that this firm will never bring back its business to England; on the contrary, it is to be feared that the example will be imitated by other firms, and the eventual result may be, that the profit of dyeing all the cloth that is sent to Germany, amounting to nearly 20,000 pieces annually, may be lost to this country.

The strike of the frame-work knitters, in 1817 and 1818, had an effect on our export trade of hosiery articles which is felt to this day. In those years the foreign buyers of these goods, being unable to obtain their usual supplies from the English manufacturers, in consequence of the turn-out, went to Germany to make their purchases. From that period the Germans got a hold on the export trade of hosiery, which they have been yearly increasing, assisted as they have been by numerous strikes of the workmen in this country. Great part of the hosiery articles which our ships export from England, is in fact not made here, but at Chemnitz, in Saxony; and it only comes to London to be exported to America, and other quarters of the world, a duty of 20 per cent. preventing its consumption in this country. Now, we will suppose the Derby and Leicester workmen to succeed in a strike, and to raise their wages to such a degree that the price of the articles they make is increased 20 per cent. The foreign hosiery which is now in the king's warehouses under lock and key, would instantly have the duty of 20 per cent. paid on it, be brought into our market, and the triumphant workmen and their masters be ruined directly. As it is, the strikes have done irreparable damage to this trade, and the flourishing German town of Chemnitz owes great part of its prosperity to the trades' unions of this country. It cannot be a pleasing sight to see the large population of Chemnitz happy, contented, and employed, while what must be the feelings of an Englishman, looking on that smiling scene of peaceful industry, and reflecting on the pleasure with which he regards it, mingled with some feelings of sorrow, that should strike him that that prosperity might have been English—that that employment, that

* Instead of *Dissension*, the ordinary editions of Jones's poems say *Discord*; but it would surely be absolute nonsense to call this respectable quality a *fiend*.

happiness and contentment, is so much torn from England by the folly of the Derby and Leicester workmen. A century and a half ago the King of France drove great part of the silk trade from that country to this by his tyrannical edicts: our workmen are in a fair way to do the same with respect to England by their trades' unions."

These facts, if there be no fallacy in them, and we can see or suspect none, are surely of a most instructive nature. They recall to our minds an observation which we have long been accustomed to make, when the great prosperity and civilisation of Britain were alluded to, and when it was argued that, as with all ancient nations, ours, now that it had reached to all appearance its height, must begin to decline. We have been accustomed, in reference to this prognostication, to point out that a modern civilised nation differs from those of antiquity, in as far as it neither has barbarous neighbours to break in upon and overwhelm it, nor an uninstructed populace to overthrow the government of an enlightened few, such as ancient governments usually were. And we consequently felt assured that, the circumstances being thus different, the result would be different too. We now, however, have some fear that the circumstances are not so far different as we once imagined. *The great bulk of our people are not an instructed people.* They are not the totally unlettered populace of the states of antiquity, but neither are they sufficiently enlightened to know the principles on which their happiness depends, nor are they under sufficient moral regulation to control their instinctive impulses of whatever kind. Hence the violence which a large portion of them are at present manifesting, to the certain defeat of all their professed aims, and the great endangerment of their most important interests. If Britain shall henceforward sink from its manufacturing pre-eminence, while other nations, taking advantage of its ingenuity and its resources, rise on its ruins, the case will certainly form a striking proof of the eternity of all great causes, and that stability and permanence are mere ideas of man's mind, not laws of universal nature.

KIDNAPPING SYSTEM OF THE LAST CENTURY.

[The following curious account of the kidnapping practised at Aberdeen about the middle of the last century, is from a small work of extraordinary research for its class, and a great deal of humour and point, to which we lately alluded as being just published—"the Book of Bon Accord, or a Guide to the City of Aberdeen." The details of the traffic will appear to many as scarcely credible; yet we have no doubt that the whole are true, seeing that they are supported, in the work from which we quote, by evidence taken in a court of law.]

BETWEEN the years 1740 and 1746, Aberdeen, in common with some other towns in Scotland, was disgraced by a barbarous traffic, which consisted in kidnapping persons of both sexes, and transporting them to the American plantations, where they were sold as slaves for a limited period. The extent, the misery, and the horrors of this ignominious trade, and the reckless manner in which it was pursued, might surpass belief, were they not too clearly established by testimony which it is impossible to doubt. Copartners were openly formed for carrying it on, and ships yearly left the port loaded with crowds of unhappy beings, of whom hardly one ever returned to his native land. The individuals engaged in this guilty commerce were men of note, of fortune, and in public office; among them were Bailie William Fordyce of Aquhorthies, Walter Cochran, town-clerk-depute, Alexander Mitchell of Colpna, and several others. The methods which they used to entrap their victims were as varied as they were infamous. Every art of deceit and seduction was employed; agents, drummers, pipers, and recruiting sergeants, were dispersed throughout the town and shire to assail the unwary with bribes, alluring promises, intoxication, and still more disgraceful temptations. Parties of men patrolled the streets of the burgh like press-gangs, and by open violence seized on such boys as seemed fit for their purpose. The inhabitants of the neighbourhood dared not send their children into the town, and even trembled lest they should be snatched away from their homes; for in all parts of the county emissaries were abroad. In the dead of night children were taken by force from the beds where they slept; and the remote valleys of the Highlands, fifty miles distant from the city, were infested by ruffians, who hunted their prey as beasts of the chase. A still darker feature remains to be noticed: such was the scarcity of provisions at that time, that the poor were tempted to sell their own offspring; and in the account-books of one of the kidnapping companies which have been preserved, such entries occur, as, "To Robert Ross, for listing his son, one shilling;" and, "To Maclean, for listing his brother Donald, one shilling and sixpence." For the honour of humanity, it is to be hoped that such cases of depravity were very rare; and, indeed, there are recorded too many instances of the heart-rending sufferings of parents in the loss of their children.

The persons thus kidnapped were of every character, sex, and age—men and women, half-grown lads, and boys not more than six years old. Once in the possession of their oppressors, they were driven in flocks through the town, like herds of sheep, under the care of a keeper armed with a whip; or they were shut up in a barn in the Green, where a piper was hired to play to them, while they were freely supplied with cards in

order to divert their thoughts from any attempt to escape. Nay, so unblushingly was this infamous commerce practised, that, when other receptacles overflowed, the public work-house was used as a place of incarceration; and when this too failed, the tolbooth, or common prison, was appropriated, and numbers of individuals were detained in it for weeks together. "During their confinement," to borrow the language of Mr MacLaurin, afterwards Lord Dregburn, who was of counsel in the cause by which this traffic was exposed, "the parents, and other relatives of those who had been enticed or forced away, flocked to Aberdeen in hopes of effectuating their release—hopes which they would never have entertained, had they reflected that the town-clerk and one of the bailies were deeply interested to thwart them. Accordingly, no solicitations or entreaties availed, and those who seemed too importunate were threatened themselves with banishment, imprisonment, and other distress. It will readily occur that it is much easier to imagine than describe the scenes which it is in proof ensued; for nothing more piteous and moving can well be figured than to see fathers and mothers running frantic through the streets, crowding to the doors and windows of the houses where their children were incarcerated, and there giving them their blessing, taking farewell of them for ever, and departing in anguish and despair, imprecating curses upon those who were the authors of their misery."

There are no means of ascertaining the exact number of the individuals thus kidnapped. One of two vessels which sailed from the harbour in 1743, contained no fewer than sixty-nine persons; and when it is considered that the trade was carried on to an equal extent for nearly six years, it is impossible to estimate the number of unhappy beings carried off at less than SIX HUNDRED. Their condition in the land to which they were conveyed was truly miserable. They were sold to planters for a term of years, varying from five to seven. During this period of slavery they were treated with harshness and cruelty; they were whipped at the pleasure of their masters; if they deserted for thirty days, twelve months were added to their slavery. In a word, such was their wretchedness, says one, who was an eye-witness to their sufferings, "that they were often forced to desperate measures, and to make away with themselves."

At the present day, when the authority of the law is severely vindicated, and its protection interposed in behalf of the poorest subject, it may be matter of surprise to some, that, for such grievous wrongs as have been narrated, no redress was sought or obtained. But in those times it should be recollected that Scotland was but half civilised, and that the lower orders, upon whom these injuries were inflicted, were as ignorant of their rights as they were powerless to assert them.* It is in evidence that many of those who endeavoured to procure the restoration of their children were menaced with imprisonment and banishment, and were so terrified at these impotent threats, that they abandoned their attempts. And, as an instance of the manner in which the persons who conducted this disgraceful traffic had fenced themselves against punishment, it may be mentioned that when a father, who had been robbed of his son, instituted an action for redress before the Lords of Session, no officer in Aberdeen could be prevailed on to cite the parties to appear in court.

It is consolatory to know that, although these traffickers in human blood succeeded in evading the vengeance of the law for a period of nearly twenty years, the arm of justice was at length raised to smite them. Among the youths whom they carried off was one named Peter Williamson, "a rough, ragged, bullet-pated, clever boy." After many strange reverses of fortune, and many romantic adventures by sea and land, in peace and war, in April 1757 this individual was at Plymouth, discharged (on account of a wound) from a regiment into which he had been drafted. With the sum of six shillings, with which he had been furnished to carry him home, he set out on his journey, and reached York, when he published a tract, entitled "French and Indian Cruelty, exemplified in the Life and various Vicissitudes of Fortune of Peter Williamson, who was carried off from Aberdeen in his Infancy, and sold as a Slave in Pennsylvania." Such, it appears, was the sale of this work, that the author "began to think himself happy in having endured these misfortunes, a recital of which promised to put him in a more prosperous situation than he had ever hoped for; and having thus procured a considerable subsistence, the desire of hearing some account of his parents induced him to travel to Aberdeen." Here he arrived in June 1753, and exhibiting himself in the dress and arms of the American savages, his representations of their gestures and war-whoop were applauded by crowded houses, while his pamphlet met with a rapid and extensive circulation. His exposure of the system

of kidnapping, however, having incurred the wrath of the magistrates, he was dragged before their august tribunal, on the accusation of having issued "a scurrilous and infamous libel on the corporation of the city of Aberdeen, and whole members thereof." Of this charge he was at once convicted; the obnoxious pages of his tract were ordered to be torn out, and "publicly burnt at the market-cross, by the hands of the common hangman, the town-officers attending, and publishing the cause of the burning;" he was ordained to be incarcerated till he should sign a denial of the truth of his statements; he was subjected to a fine of ten shillings, and banished from the city. Williamson brought an action against the corporation for these proceedings, and on the 5th of February 1762, the court unanimously awarded to him damages to the amount of £100, besides the expense of the litigation, about £80, "for which the lords declare the defenders to be personally liable, and that the same shall be no burden upon the town of Aberdeen." It was the intention of the officers of the crown to institute a criminal prosecution against the parties engaged in the trade of kidnapping, but it unfortunately happened that the wretches were secured from punishment by a certain Act of Indemnity. They were, however, still responsible to Williamson, and in an action which he raised against Bailie Fordyce and others, on the 3d of December 1768, he obtained a sum of £200 in name of damages, in addition to the costs of his litigation, which were modified to one hundred guineas.*

POKINGS IN ETYMOLOGY.

THIRD AND CONCLUDING ARTICLE.

THE "spacious firmament on high" derives its expressive name from the verb "to *heave*," as *heaven* is nothing more than the old form of the participle *heaved* (raised). The same idea is conveyed in the Scottish name *lift*, by which the star-spangled canopy is also denoted.

The origin of *pagan* was explained in a former article. The word *heathen* springs from a very similar consideration, and, strange to say, has an intimate connection with *heath*. The latter word, though now restricted to a particular class of plants, was applied in the old Saxon to all plants and shrubs, particularly those of a wild description. As civilisation, including the better cultivation of the ground, followed in the wake of Christianity, we can easily perceive how those less favoured nations, who enjoyed neither of these advantages, should be classed under this universal epithet.

When we brand an individual with the character of "an *egregious* fool," it not unfrequently happens that our opinion of his deserving the appellation proceeds from our observing him to deviate *à grege*, "out of the flock," forgetting that he may, all the while, be conscientiously endeavouring "not to follow the multitude to do evil."

Some words are merely the proper names of persons or objects remarkable for the exhibition of the idea or quality intended to be conveyed, or at least suggesting it readily to the mind. Thus *romeria*, in Spanish, originally denoted a pilgrimage to Rome, but is now extended to the annual visits of the people to any adjacent or favourite shrine, the said visits being now only remarkable for the feasting, dancing, and merriment, that form the order of the day. On the same principle, our verb "to *roam*" unquestionably took its rise from the frequent practice of journeying to the capital of Christendom, and sometimes enduring penance from every footstep, although now the idea of *roaming* suggests rather more pleasurable anticipations. Again, a river is said to *meander* when its course is serpentine, like that of the *Meander* in Asia Minor; a mineral spring is called a *spa*, from the remarkable waters at a German town of that name; and so on in a multitude of similar instances.

We have already alluded to the etymology of the word *husband*, and its conveying a moral remembrance to the wearers of that honourable though too often inappropriate title. A similar remark applies to *spouse*, and the lesson conveyed by the Latin origin of this word is still more important, as it applies to both the

* This second action furnishes a striking proof of the scoundrelism of Bailie Fordyce and his associates. Having obtained the temporary withdrawal of the process from the court, in order that it might be submitted to friendly arbitration, the worthy defenders entered into a conspiracy to intoxicate the arbiter, and procure his signature to a decision in their favour. In this laudable design they were successful, but the judgment was set aside by the supreme court, 27th February 1766. The arbiter was the sheriff-substitute of the county. On the day preceding that on which he gave his interlocutor, he "was busy at hot punch about eleven o'clock forenoon;" having become "very drunk," at two o'clock he sat down to dinner, after which he "sat close drinking, as is the phrase in that part of the country, *heller-skeller*, that is, copiously and alternately, of different liquors, till eleven o'clock at night, when, being dead drunk, he was conveyed home by his two maid-servants." On the morrow, shortly after nine o'clock, "a large dose of spirits, white wine, and punch, was administered to him, with cooling draughts of porter from time to time." After dinner, he and two others "sat down to ombre, drinking at the same time, *heller-skeller*, a bottle and a half of malaga, a mug of porter, two bottles of claret, a mutchkin and a half of rum made into punch." After these potations, the learned sheriff gravely pronounced judgment, and retired to bed, where he lay all the next day (being Sunday) "dead drunk and speechless!" One of the witnesses speaks of having seen this sober judge "upon the bench, when he appeared to be *aw*, and as if he had been drunk the night before." It is remarked, in one of the pleadings, that the sheriff's "mother died about the 4th of November, and there can be no doubt that he would get a hearty dose at her burial!"—*Author's note.*

* As a small auxiliary proof of how little regard was paid in our country at that time to the liberty of the subject, we may mention a fact which we some time ago chanced to observe in the Scots Magazine of the day—namely, that, in May 1756, when men were much in request for the navy, on account of the commencement of what afterwards came to be called the Seven Years' War, a man, having been put into the guard-house in Edinburgh for swearing on the streets, was next day sent on board the tender in Leith Roads as a seaman, a proceeding for which there was not the slightest warrant in law. His friends, it is added, presented earnest petitions for his liberation to the Court of Session—the chief civil court of the country—but the lords refused to interfere.—*Ed.*

"high contracting parties." *Sponse* is from *spondeo*, "to promise," and were its meaning generally known and well impressed on the promising party, it might lead to more accurate performance than the marriage vow, in many an unhappy instance, experiences.

The word *soldier*, though exciting high and chivalrous ideas, becomes unfortunately lowered in our estimation when we consider its origin from *solidum*, the pay or wages received for service, as there is the painful reference to mercenary motives which may influence the choice of this profession even in the individual that would limit such views to those that fight under a foreign banner. The French are so aware of the unpleasant etymology of this word, that even a common sentinel would consider it an affront to be addressed or pointed out as *un soldat*, claiming his right to be denominated by the more sonorous and less equivocal title of *un militaire*.

Familiar though *biscuit* be in the catalogue of "household words," the majority of our readers may not be aware of its name being a brief explanation of its mode of manufacture. It is, in fact, merely the junction of the two French words *bis cuit*, "twice baked." The French have but few compound words of native or vernacular origin, and the most expressive one we at present remember is *lieux*, "a halter," from *lier* and *cou*, which in English might be rendered "bindneck" or "neckband." In such compound words our language is immensely superior, but is again, one might say, infinitely surpassed by the German, which, from the unlimited power it exerts in such formations, derives its singularly picturesque expressiveness in portraying the subtle combinations of thought. Many compounds in this last language are, at the same time, interesting from their extreme simplicity, for instance *handschuh*, "a hand-shoe or glove," &c. Before leaving this digression on compound words, we may allude to the elegant facility with which these combinations are formed in Greek, to which language we are indebted for an almost unbounded supply of terms, not only to denote but to define every new invention or discovery. Not to speak of *thermometer*, "heat-measurer," *barometer*, "weight (of air) measurer," *telescope*, "far-looker," and innumerable other words of science, there is scarcely a mechanical trade that does not now coin epithets in this exhaustless mint to keep pace with the march of improvement. That prince of humorous satire, Swift, proposed the application of a quadrant to the angular measurement of the human body, as the most accurate preliminary to a "true fit;" but how would he be astonished to hear of that "unparalleled invention," the *andrometer*, or "man-measurer," by which his jocular hint has been reduced, though not quite in his style, to a practical reality! Apologising for this unintentional transition from biscuit to a suit of clothes, we resume our desultory anecdotes.

This very word *desultory*, which we have accidentally stumbled on, is of very expressive formation, being derived from the Latin *de*, "off," and *salio*, "to leap or jump," and finely describes the irregular and unsteady procedure of him who leaps off one subject to another.

In a former article, the depreciation of meaning which the word *villain* has gradually undergone, was explained. An exact parallel to its unfortunate downfall is to be found in the corresponding case of *clown*. This epithet, which now comprehends every defaulter against the laws of genteel deportment in all ranks and stations of life, is but a corruption of the Latin *colonus*, "a husbandman," from the verb *colo*, "to till or cultivate," and the transition of its meaning so as to indicate not the men of that occupation, but the awkwardness of their undisciplined manners, is obvious and natural. To the same origin is to be traced that name, now of such engrossing interest, *colony*, from the nature of the pursuits that are of primary importance in an infant settlement, which must always commence by being a colony of husbandmen, though certainly its progress would not be accelerated by its being a colony of clowns.

How important were it that all jurymen should have impressed on their minds the solemn import of that important and often death-giving word *verdict*, as it ought always to be, what the etymology declares, *vere dictum*, "truly spoken."

That class of our readers who have not studied French, may not be displeased at our telling them that *vinegar* is *vin aigre*, "sour wine," indicating the original source from whence that article was procured. In French, the two words are combined without change into one.

The origin of the English word *beaker* for a peculiar sort of drinking cup (which is evidently the twin-brother of our Scottish *bicker*), has been generally, though erroneously, ascribed to the supposed resemblance of its spout to the beak of a bird. Both words are manifestly corruptions of the Italian *bicchiere* (pronounced *beeky-ay*), meaning a glass or cup to drink from.

We have already pointed out how the verb *to prevent* came to acquire two meanings apparently contradictory, though each of them was easily traced up to the same radical signification. A similar catastrophe, which has sometimes led to laughable perplexity of interpretation, has befallen the two words *condescend* and *mortification*, in their adoption as terms of Scottish law. The former, in its radical meaning, implies descending with, the *con* (or *with*) implying here, as in several other words to which it is prefixed, *frankly or fully*. Thus *conceive* supposes a fulness of hollowiness, *confess* (*con* and *fateor* "to speak") means "to speak frankly and fully," *confide*, to trust frankly and fully, *contain* (*con* and *teneo*,

"to hold") to hold fully, &c. Hence we easily understand the meaning of a Scottish man of business, who should write to his English correspondent, "I hope you will condescend, in your next letter, upon all the particulars of the case;" and we can also imagine the amazement and offended feeling of the Southron at being indirectly accused of want of condescension in his former communications, more especially seeing that these related to his own personal interests, and that he had expressed himself with all manner of politeness and even affection to his friend in the north. Again, *mortification*, from its component words *mors*, "death," or *mortuus*, "dead," and *facio*, "to do or make," is hence susceptible of two meanings. It may imply "the being made, or becoming, dead," and, in this sense, may express the loss of vitality in any part of the body, or the deadness of feeling produced by any event that has converted the lively sentiment of hope into the dreariness of disappointment. But it may also imply the making or doing of something at death, or with reference to its approach, and, in this case, it always signifies a disposal of property. We can easily, therefore, imagine the happy legatee exulting over his comfortable mortification, and his disappointed relative, with equal justice and sincerity, deploring his "most uncomfortable" one. The mortification of the former is the fulfilment of hope, or, it may be, the possession of unexpected enjoyment; while the mortification of the other is the bitterness of frustrated expectation.

SCENE IN A FRENCH POLICE OFFICE.*

Two city officers entered the presence of the police magistrates, supporting a poor old woman, bent down and tottering under the weight of years. Her dress and other features in her appearance bespoke her to be a peasant, from some place in the environs of Paris. When seated on the bench in front of the judges, she declared her name to be Margaret Bouvier, though in a voice almost inaudible. Her age, she said, was seventy-eight years.

The presiding magistrate spoke some kind and sympathising words to the old woman, and when she seemed recovered, he said, "You have been found sleeping or lying in the street at an early hour this morning. What is the reason of this? Have you no home?" The old woman answered, "My time for a house is past, your worship. I slept in a bed whilst I could gain sufficient to pay for it. Now I can work none, and must just make my house where it costs nothing." "Cannot you get admission," said the judge, "into some poor-house or place of refuge?" "Oh!" cried old Margaret eagerly, "if your worship could get me admitted into one of these places, you would make me perfectly happy!" "These things do not depend upon this court," returned the judge; "but, good woman, you are now in a condition of vagrancy. That is a state of things which the law does not permit, but punishes severely." "Ah, well," said the woman, "since you cannot get me into an hospital, put me into prison. It is all the same; and I hope you will keep me there always, if you can."

The judge was at a loss what to do with this contented vagrant. "Have you no friends," said he, "who would reclaim you, and take charge of you?" "The poor," replied the old woman, "have no friends but the poor, and all of them have enough of difficulty in making their own living." "But have you no relations, no children?" asked the magistrate. The old woman showed much emotion as she answered, "No, your worship; do not speak to me about this, but put me in prison quickly, if you please." "The mention of children seems to agitate you," observed the judge; "you are then a mother, doubtless?" The aged female was now weeping, and she only answered, "Do not speak to me of it; allow me to forget it." It now struck the interrogator that the children had behaved cruelly to her, and turned her into the streets. He made a remark to this effect, but the old woman instantly exclaimed, "Oh, heaven! if one could tell all! my children turn me to the door, and refuse bread to their aged mother! Oh, good sir, who could think of crimes like these against my children, against my poor Julianne!" She then added in a decided tone, "I wish for the prison, your worship. I have done that which ought to place me there, and it would not be right to liberate me." "Do you then prefer to end your days in a prison or hospital, rather than among the children whom you love so much?" "That is nothing, your worship," said the female; "but do not speak more about it. Send me quickly to prison, if you have any pity for poor old Margaret."

At this moment a voice from the side of the court exclaimed, "Ah, it is old dame Margaret, living and in the body. You headstrong old woman, what have you been about?" The surprised judge immediately ordered the owner of the voice to stand forward, and he at once appeared, in the shape of a country waggoner, with blue frock and large buttons. Being questioned, this person stated that he knew dame Margaret well, and that she was the mother of Julianne Colas, who, with her husband and family, had been thrown into the deepest distress by the old woman's disappearance, fifteen days before, from their house, where she had long staid. The waggoner moreover stated, that he had brought Julianne Colas and her husband to town, and that they were then but a short way off, having come for the express purpose of lodging information about the old dame before the police. The judge ordered them to be sent for immediately.

When the old woman's son-in-law and daughter entered, the latter was so much affected by the sight of her lost parent, that she would have sunk to the ground but for her husband's support. When she recovered, she exclaimed, "Ah, mother, cruel mother, what sufferings have you not caused to us! To quit us, to disappear without a word!" The old woman, meanwhile, was endeavouring by the language of gestures to keep her friends

quiet, and to persuade them not to interfere, but to go away and leave her by herself. "My children, my children," she whispered, "do not interfere here. Leave me to manage for myself." But the daughter cried, "What! leave you here alone—leave you to go to prison—you, our old mother! To go to prison at your age! You would have me to permit this!" The judge stopped the daughter's exclamations, by saying, "She need not go to prison if you promise to lodge, to nourish, and to take care of her." "And has this been her demand here?" cried the daughter somewhat reproachfully; while the husband said, "She knows that she will always have food, clothing, and lodging—ay, and the best we have."

Old Margaret remained sorrowfully silent for a minute or two, and then addressed the magistrates with tears in her eyes: "Ah, my good judges, what is it you have done? It was that I might be no longer a charge to them that I wished myself arrested. I know well that they will take me back; I know that they would ruin themselves for me; I know their hearts. But if you knew how poor they are! All that he can earn will barely feed them and their children. So when I saw Julianne place another little one in her husband's arms, fifteen days ago, I said to myself, 'Come, old woman, it is needful that you should go and make room for this poor little one. You are old, useless, and take all without giving any thing; for their good you must go.' I went away, and wandered till I was arrested. I wished to go to prison." "You shall not go, mother!" cried the daughter. "Come away home, mother," said the husband.

This scene, together with old Margaret's extraordinary motives, moved every spectator. The aged dame at length left the court, leaning on her daughter and son-in-law, but she still continued to repeat to them with tears, "Wicked, cruel children, why would you not let me go!"

UTILITY OF THE EARTH-WORM.

THE worm-casts which so much annoy the gardener by deforming his smooth-shaven lawns, are of no small importance to the agriculturist; and this despised creature is not only of great service in loosening the earth, and rendering it permeable by air and water, but is also a most active and powerful agent in adding to the depth of the soil, and in covering comparatively barren tracts with a superficial layer of wholesome mould. In a paper "On the Formation of Mould," read before the Geological Society of London, by Charles Darwin, Esq. F.G.S., now one of the secretaries, the author commenced by remarking on two of the most striking characters by which the superficial layer of earth, or, as it is commonly called, vegetable mould, is distinguished. These are its nearly homogeneous nature, although overlying different kinds of subsoil, and the uniform fineness of its particles. The latter fact may be well observed in any gravelly country, where, although in a ploughed field a large proportion of the soil consists of small stones, yet in old pasture-land not a single pebble will be found within some inches of the surface. The author's attention was called to this subject by Mr Wedgewood, of Maer Hall, in Staffordshire, who showed him several fields, some of which, a few years before, had been covered with lime, and others with burnt marl and cinders. These substances, in every case, are now buried to the depth of some inches beneath the turf. Three fields were examined with care; the first consisted of good pasture-land, which had been limed, without having been ploughed, about twelve years and a half before; the turf was about half an inch thick; and two inches and a half beneath it was a layer or row of small aggregated lumps of the lime, forming, at an equal depth, a well-marked white line. The soil beneath this was of a gravelly nature, and differed very considerably from the mould nearer the surface. About three years since, cinders were likewise spread on this field: these are now buried at the depth of one inch, forming a line of black spots parallel to and above the white layer of lime. Some other cinders, which had been scattered in another part of the same field, were either still lying on the surface, or entangled in the roots of the grass. The second field examined was remarkable only from the cinders being now buried in a layer, nearly an inch thick, three inches beneath the surface. This layer was in parts so continuous, that the superficial mould was only attached to the subsoil of red clay by the longer roots of the grass.

The history of the third field is more complete. Previously to fifteen years since, it was waste land; but at that time it was drained, harrowed, ploughed, and well covered with burnt marl and cinders. It has not since been disturbed, and now supports a tolerably good pasture. The section here was—turf half an inch, mould two inches and a half; a layer one and a half inch thick, composed of fragments of burnt marl (conspicuous from their bright red colour, and some of considerable size, namely, one inch by half an inch broad, and a quarter thick), of cinders, and a few quartz pebbles mingled with earth; lastly, about four inches and a half beneath the surface was the original black peaty soil. Thus beneath a layer (nearly four inches thick) of fine particles of earth, mixed with some vegetable matter, those substances now occurred, which, fifteen years before, had been spread on the surface. Mr Darwin stated that the appearance in all cases was as if the fragments had, as the farmers believed, worked themselves down. It does not, however, appear at all possible that either the powdered lime, or the fragments of burnt marl, and the pebbles, could sink through compact earth to some inches beneath the surface, and still remain in a continuous layer; nor is it probable that the decay of the grass, although adding

* From a Parisian newspaper of the past year.

to the surface some of the constituent parts of the mould, should separate in so short a time the fine from the coarse earth, and accumulate the former on those objects which so lately were strewn on the surface. Mr Darwin also remarked, that near towns, in fields which did not appear to have been ploughed, he had often been surprised by finding pieces of pottery and bones some inches below the turf. On the mountains of Chile he had been perplexed by noticing elevated marine shells, covered by earth, in situations where rain could not have washed it on them.

The explanation of these circumstances which occurred to Mr Wedgewood, although it may at first appear trivial, the author does not doubt is the correct one, namely, that the whole is due to the digestive process by which the common earth-worm is supported. On carefully examining between the blades of grass in the fields above described, the author found that there was scarcely a space of two inches square without a little heap of the cylindrical castings of worms. It is well known that worms swallow earthy matter, and that, having separated the serviceable portion, they eject at the mouth of their burrows the remainder in little intestine-shaped heaps. The worm is unable to swallow coarse particles; and as it would naturally avoid pure lime, the fine earth lying beneath either the cinders and burnt marl, or the powdered lime, would, by a slow process, be removed and thrown up to the surface. This supposition is not imaginary; for in the field in which cinders had been spread out only half a year before, Mr Darwin actually saw the castings of the worms heaped on the smaller fragments. Nor is the agency so trivial as it at first might be thought, the great number of earth-worms (as every one must be aware who has ever dug in a grass field) making up for the insignificant quantity of work which each performs.

On the above hypothesis, the great advantage of old pasture-land, which farmers are always particularly averse from breaking up, is explained; for the worms must require a considerable length of time to prepare a thick stratum of mould, by thoroughly mingling the original constituent parts of the soil, as well as the manures added by man. In the peaty field, in fifteen years, about three inches and a half had been well digested. It is probable, however, that the process is continued, though at a slow rate, to a much greater depth; for as often as a worm is compelled by dry weather, or any other cause, to descend deep, it must bring to the surface, when it empties the contents of its body, a few particles of earth. The author concluded by remarking, that it is probable that every particle of earth in old pasture-land has passed through the intestines of worms, and hence, that in some senses the term "animal mould" would be more appropriate than "vegetable mould." The agriculturist, in ploughing the ground, follows a method strictly natural; and he only imitates, in a rude manner, without being able either to bury the pebbles or to sift the fine from the coarse soil, the work which nature is daily performing by the agency of the earth-worm.

Since this paper was read, Mr Darwin has received from Staffordshire the two following statements:—1. In the spring of 1835, a boggy field was so thickly covered with sand, that the surface appeared of a red colour, but the sand is now overlaid by three quarters of an inch of soil. 2. About eighty years ago, a field was manured with marl, and it has been since ploughed, but it is not known at what exact period. An imperfect layer of the marl now exists at a depth, very carefully measured from the surface, of twelve inches in some places and fourteen in others, the difference corresponding to the top and hollows of the ridges or butts. It is certain that the marl was buried before the field was ploughed, because the fragments are not scattered through the soil, but constitute a layer which is horizontal, and therefore not parallel to the undulations of the ploughed surface. No plough, moreover, could reach the marl in its present position, as the furrows in this neighbourhood are never more than eight inches in depth. In the above paper it is shown that three inches and a half of mould had been accumulated in fifteen years; and in this case, within eighty years (that is, on the supposition, rendered probable from the agricultural state of this part of the country, that the field had never before been marled), the earth-worms have covered the marl with a bed of earth averaging thirteen inches in thickness.—*Penny Cyclopædia*.

THE INGENIOUS PROOF.

A Spaniard once met an Indian in one of the vast forests of South America; both travellers were on horseback. The Spaniard, however, was badly mounted, and the horse of the Indian being young and strong, he asked its possessor to make an exchange—a very modest request certainly. The Indian of course refused, but the Spaniard being well armed, forcibly dispossessed him of his steed, and continued his journey. However, the Indian was not to be thus treated with impunity; he followed the aggressor to the next town, and immediately laid his complaint before the judge. The Spaniard was obliged to make his appearance, and to bring the horse along with him. He treated the plaintiff in a most contemptuous manner, branding him as a knave, and asserting that the horse was not only his property, but that he had reared it from a foal. There was no evidence to the contrary and the judge was about to pronounce decision against the Indian, when the latter suddenly exclaimed, "The horse is mine, and I will prove it!" He immediately took off his cloak, and throwing it over the horse's head so as to cover its face, said, "Since this man has asserted that he brought up this horse, let him tell us of which eye he

is blind." The Spaniard, afraid to appear embarrassed, or in the slightest doubt, instantly answered, "of the right eye." The Indian withdrew his mantle from the horse's head, and exultingly exclaimed, "He is neither blind of the right nor of the left eye!" The case was now perfectly clear. The judge restored the animal to its proper owner, and ordered the Spaniard to be suitably punished.

THE WARRIOR.

A gallant form is passing by;
The plume bends o'er his lordly brow;
A thousand tongues have raised on high
His song of triumph now:
Young knees are bending round his way,
And age makes bare his locks of gray.
Fair forms have lent their gladdest smile,
White hands have waved the conqueror on,
And flowers have decked his path the while,
By gentle fingers strown.
Soft tones have cheered him, and the brow
Of beauty beams uncovered now.
The bard has waked the song for him,
And poured his boldest numbers forth;
The wine-cup, sparkling to the brim,
Adds phrensy to the mirth;
And every tongue, and every eye,
Does homage to the passer by.
The gallant steed treads proudly on;
His foot falls firmly now, as when,
In strife, that iron heel went down,
Upon the hearts of men,
And, foremost in the ranks of strife,
Trode out the last dim spark of life.
Dream they of these, the glad and gay,
That bend around the conqueror's path?—
The horrors of the conflict day,
The gloomy field of death,
The ghastly stain, the severed head,
The raven stooping o'er the dead!
Dark thoughts, and fearful! yet they bring
No terrors to the triumph hour,
Nor stay the reckless worshipping
Of blended crime and power.
The fair of form, the mild of mood,
Do honour to the man of blood.
Men, Christians, pause! The air ye breathe
Is poisoned by your idol now;
And will you turn to him, and wreathe
Your chaplets round his brow?
Nay, call his darkest deeds sublime,
And smile assent to giant crime?
Forbid it, Heaven!—A voice hath gone
In mildness and in meekness forth,
Hushing, before its silvery tone,
The stormy things of earth,
And whispering sweetly through the gloom
An earnest of the peace to come.
Fugitive.

CAUSE OF THE SOUND PRODUCED BY INSECTS IN FLYING.

It is an opinion generally entertained not only by common people but by natural philosophers, that the noise produced by insects such as the gaffly and bee during their flight, arises from the vibration or rapid motion of their wings. Such a supposition is extremely plausible at first sight. We see the animal moving through the air; we know that the wings are in a state of rapid motion; and we also know that it is natural for a body rapidly vibrating in the atmosphere to cause a sound. We put all these facts together, and we conclude that the phenomenon is explained when we attribute the sound to the rapid waving of the wings. But, like many other hypotheses which owe their origin to the evidence of the senses alone, this appears to be erroneous. Dr Hermann Burmeister, of the University of Berlin, an entomologist of great distinction, has investigated the subject with much ingenuity, and arrived at a very different result from the common belief. His remarks have appeared in a German journal of science, and have attracted attention in France and England, as well as in his own country. We shall present a brief outline of his researches. They are not only interesting in themselves, but afford a good example of the manner in which scientific investigations ought to be pursued.

"I soon found," says he, "that the wings have no part in the formation of the sound, for the hum of the insect continues even when its wings are entirely cut away. I perceived, however, a different pitch of the sound, and remarked that the more of the wing that was taken away the higher this became." He ascertained that the sound which the insect emits is susceptible of considerable variations. "It may be that it maintains an equality of pitch and strength during a uniform motion of the wings, for so in fact it appears; but every change in the velocity of the flight, every disturbance of the ordinary motion, generally causes also an alteration in the tone. An idea of the origin of the tone is, however, only to be obtained when the insect is held by the legs, and excited by pressure or other means to go through all its motions of the wing, and thus to produce a sound." The professor found in this manner that the tone of the common gaffly varied from E to B flat (bass clef), as the effort to extricate itself from his hands was put forth with greater or less energy. Such a difference might be explained, it is true, upon the supposition that the agitation of the wing produces the tone by the varying rapidity with which the vibrations are made; but this explanation is untenable, as the phenomenon continues when the wings are entirely cut away; an operation which produces only a variation of the tone, but does not render its formation impossible.

The doctor then elaborately anatomises that part of the insect which is necessarily employed in producing the sound, and illustrates the whole by a plate and numerous drawings. From his inquiries we learn that that part of the insect by which alone the sound is produced, is the breast or thorax. In two-winged insects, this consists simply of a cavity covered by a thin membrane, which exhibits on its surface various elevations and depressions, but is, nevertheless, perfectly continuous. To this hollow case are attached different sets of muscles, which serve for the motions of the legs and wings, and are capable of contracting the cavity in various directions; just, for instance, as one may contract the length of a bladder by pressing the two ends between the hands, or the breadth by squeezing the two sides in like manner. In this cavity of the insect's thorax there are two very small holes, which let air out or in by the following process. When the wings rise and fall, as in flying, the cavity is alternately contracted or expanded, the result of a peculiar mechanism on which the motion is dependent. Now, it is clear that the contraction must drive out a part of the air, just as a piper expels the air from the bag of his instrument by pressing his arm against it. On the other hand, when the cavity of the insect is expanded by an opposite motion of the wing, an equal quantity of air rushes through the air-holes. There is, therefore, connected with the motion of the wings, a constant proportionally rapid and intense breathing, and this breathing is the true cause of the sound. It is the efflux and influx of the air which produces the buzz or hum which we hear, just as the current of air draws music from the Æolian harp when forced at short intervals through the small holes of the sound-board, or, to take a more familiar example, by a mechanism similar to that of the mouth in whistling. The sound of the Æolian harp bears a remarkable resemblance to that of many insects.

Now, it is evident that this theory can be proved or disproved in a very simple and satisfactory manner—namely, by closing up the air-holes of the thorax of the insect, without injuring it in any other way. This was done by Professor Burmeister, and the flight of the gaffly was then found to be accompanied by no sound whatever—a result which we consider decisive of the point. It is true that the insect dies of suffocation soon after such an experiment, but not directly, because there are air-holes situated lower down, in the abdomen of the animal, and through these respiration is continued for a short time. But they emit no sound during the flight of the insect, for they are then totally inactive. The insect breathes through the air-holes of the abdominal part when it sits and crawls, but through the air-holes of the thorax when on the wing. According to this view, the hum of insects is in reality a whistle. The professor says, with regard to the alteration in the pitch of the sound, "The variation which the mutilation of the wings causes in the tone is easily to be accounted for, if we consider that by this action the moveable part becomes lighter, and also that the motion of the same, by the continued equal exertion, is quicker; but this causes a quicker current of air, which must produce a higher tone. On the contrary, a mutilation of the moveable apparatus produces a slower motion, a slower current of air a deeper tone. I believe that the foregoing facts and observations offer sufficient evidence, but the reader can satisfy himself as to the truth of the phenomenon, by performing the same simple experiments." We see no necessity for putting any more insects to death about a matter which seems so satisfactorily set at rest.

EDUCATION OF THE PEOPLE.

The education of the working-classes abroad attracted much of my attention; and to the care afforded by foreign governments to its advancement do I attribute much of the greater contentment and lesser criminality which characterises the artisans of the continent, and which I particularly remarked in the manufacturing districts. Here education is left to the philanthropy of individuals, or to the accidental wisdom of parents. Abroad it is deemed an element of government, essential to the comprehension of and obedience to the laws, and requisite alike to the interest of the state and to the welfare of the recipient. In France the cost of education is provided for out of the municipal funds, which are by law authorised to support schools. In Belgium it is equally provided for by law. In Switzerland ignorance is punished; in Prussia and Bavaria education is compell. In Austria, in addition to scholastic establishments, certificates of attendance are made passports to employment. Even in Russia, Alexander is establishing throughout his dominions schools on the most approved system, and conducted by masters supplied from the normal schools of the civilised nations. In Egypt, under the superintendence of her singular pacha, schools and universities on the most liberal scale are every where arising; in England, enlightened literary England alone, does legislation reject education as an handmaid of government! and in point of the instruction of the population at large, she stands sixth among the nations of Europe!—*Symons's Arts and Artisans at Home and Abroad*.

THE OPINION OF THE WORLD.

Most men live in a world of their own, and in that limited circle alone are they ambitious for distinction and applause. Thus, cases of injustice, and oppression, and tyranny, and the most extravagant bigotry, are in constant occurrence among us every day. It is the custom to trumpet forth much wonder and astonishment at the chief actors therein setting at defiance so completely the opinion of the world; but there is no greater fallacy; it is precisely because they do consult the opinion of their own little world that such things take place at all, and strike the great world dumb with amazement.—*Nicholas Nickleby*.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

"SURE IT WAS ALWAYS SO!"

THE incident and conversations I am about to relate occurred in a very picturesque but wild neighbourhood on the sea shore—not in my own more civilised district, but where I spent a fortnight of mingled pleasure and pain, where I saw misery it was out of my power to relieve, and found the people so fond of assuring us things *were always so*, that it was no easy matter to convince them things might be better than they were. The house where we were domiciled commanded a wild and extensive sea view. Miserable and neglected cottages clung to the crumbling walls of a domain once of princely extent, and no fashionable lady ever laboured to *kill time* more zealously than the amphibious occupants of those huts. Amphibious I may well call them; the men were fishers by profession, that is, they went to sea when compelled to do so by the want of that simple food which is all they desire. They were (the younger portions of the community especially) very independent of clothing. The women—what did they do? Why, they married and nursed children, and sat in the sun in summer, and over their turf or drift-wood fire in the winter, carried the fish their husbands caught to the farmers' houses, or the dwellings of the gentry; *made nets*, and knit stockings, although they seldom *mended* either the one or the other. The children (what healthy, ruddy-brown, handsome, young things they were!) ran about and over the rocks and sands at low water, gathered the pretty conical periwinkle, or knocked the green-striped limpets off the rocks, watched cunningly for the rising of the observant razor fish, or waded through the rippling waves to catch the springing shrimps. Women and men both gathered delisk, and what they call *sluck*, or *slucktown* (I cannot spell it, but so it sounds), here called *Laver*; they were indolent as the Neapolitan lazzaroni, and quite as picturesque; very sensible of kindness, as the Irish peasant always is; superstitious, as dwellers by the mighty waters commonly are; patient and cheerful, willing to do any thing in the world for "the quality," and as little as possible for themselves; honest as truth itself. There we were in the midst of what in England is branded with the degrading term of "*pauper population*," poor half-starved, half-dressed, ragged creatures, and yet neither lock nor bolt was ever used in the house. I tried once to turn the key in the great hall door. I shall never forget the amused countenance of the good old master of the mansion, when he found me with both hands endeavouring to accomplish my intent.

"God bless you, my dear! let it alone. I give you my honour" (his pet declaration) "that key has never been turned in that lock since the year of the rebellion; and though we had hardly any of it here, Pat Delaney and myself *fixed it for locking*, and the fishermen heard of it, and came up, women and all, roaring and crying to know what they had ever done to make me lock my doors."

There never was a more benevolent man than our host, but he *said* he had nothing left to give to the poor, except kind words, and had grown so accustomed to their misery, that he did not seem to mind it—it was a thing of course; in truth, he had deep sorrows of his own. One evening we were sitting in the ruined window of the grey old tower that overlooked a stony bridle-road, leading from the beach to a near mountain; the old gentleman had gone to the neighbouring town to consult his attorney about some five or six

lawsuits that were coming on, or hanging over, and his daughter and myself were chatting and systemising, she, alive to every plan of improvement, but lacking patience to carry them into execution, mourning over her lack of means, while I proved, at all events to my own satisfaction, that more improvement can be worked out in Ireland *without* money, than in any other country in the world *with* it. Nothing can be done in England without *capital*. Every hundred you possess is a step in public estimation; but there are many ways to an Irishman's heart, *wealth* being the last, the very last thing to raise you in his opinion. A person of small means, gifted with good temper, *patience*, and good sense, could work miracles in Ireland—*patience* being an indispensable requisite to every planner of Irish improvement.

Well, there we sat, and presently a woman, bearing in her hand a kettle, having lost its cover and the top of its nose, and balancing a pitcher in tolerably perfect condition, followed, of course, by a numerous progeny, strolled up the hill.

"Good evening to you, Molly," said my friend.

"God bless you, miss, and give the masher great glory over his enemies. We know he's away to the lawyer's; and, Miss Machree, if I war to send up to the big house, may be you wouldn't have a *bitteen* of plaster to take the sting out of little Sandy's foot—a burn the craytur got last night on his shin, while I was away for the water. Oh, thin, it's weary to think we've so far to go for a *dropeen* of water. Oh, wisha! wisha! I often pray to God to make the salt sea fresh, and then we'd have it ready to *bile* the paytees in, at our own door. My husband says it's a sin for me to be going that way against *nature*, 'for,' says he (he's a knowledgeable man), 'Molly,' says he, 'you ould fool, if the sea was *fresh* water, what would we do in the Lent for *salt herrings*? Any way, my heart's broke these *ten years*, *ever since I cum to the place*, for want of fresh water.'"

Having been assured that Sandy should have a plaster, Molly went toiling and grumbling up the hill; and I learned for the first time that the want of "fresh water" was a serious inconvenience to the fishers' village, as they had more than a mile to go for it.

Presently up came a party of young girls laughing, so that their white teeth glittered like pearl; balancing their pitchers on their heads with inimitable ease, while their bare feet passed over the stones without apparent annoyance, and their carriage so free and graceful as they placed their hands on the water-vessels, and dropt their curtesy beneath our window, would have made the fortune of a *dansusee*.

"Margaret," said my friend, "where's Norah?"

"Is it Norah, miss? She had a misfortune, miss, with Katty Maggs's can. The sharp rock at the edge of the stream above there knocked the side out of it, and she's hiding for fear of Katty Maggs; and sure that same stone has destroyed every thing, sticking up so sharp at the most convenient place to draw the water."

"Is it a big stone?"

"No, ma'am, but cruel sharp."

"Why isn't it removed?"

"Oh, ma'am, *sure it was always so*; we must mind better, or there wout be a pitcher in the town-land left alive with it!" And away tripped the maidens.

Many others, women, girls, and children, followed, all complaining of the want of water, all complaining of the distance, and all murmuring that they had nothing "fit" to bring home "a sup" of water in, which was perfectly true. Old women, and thirsty men, followed after a time, some pausing to lean against the

grey stones that formed the *ditches*, others ascending the hill half way, and then lying down on the road, to await the water-carriers' return; and they, too, bewailed the want of water.

"It's the ruin of the women and girls this going to the hill-spring, miss," said a crabbed-looking old sailor to my companion. "I can't get my Nelly to mend a net, or put a hand to the boat, for going for water, and half the time spent in gossiping. I'm sure I wish some one would see if there's any truth in what ould Grizzle Burn used to say, of a well her mother drew water from, where the white thorn hangs over the cliff. To be sure, the *tree in my memory was always so*."

"And is it possible," I exclaimed, "that there is the remotest chance of your obtaining water so near home, and yet you have never sought it?"

"*It was always so*," repeated the crabbed old sailor; "my mother, God be good to her, *broke her leg*, and *went a cripple to her grave*, through the manes of the sharp stone at the hill-spring's side; bad luck to it for a stone! *It was always so*."

The very stone, I suppose, that had completed the ruin of Katty Maggs's can!

My friend was not a bit too well pleased that I had received another hint as to the injurious effects of "we'll see about it;" the gentry are very apt to take offence if you notice an Irish fault; I am constantly obliged to remind them that

"I too am of Arodis."

and have an undoubted right to find fault with my own. God help them! if they loved the land with the affection I bear to every blade of its green grass, it would have a more peaceable and prosperous peasantry. Why have they not found out that an Irishman must be actively employed, to be either peaceable or happy? But to my story. Those who arrived first from the hill-spring had to return there again, for the thirsty waiters drank the water, with the certainty that it was cheerfully bestowed.

"Take another drink, Andy, poor man!" said one of the slight girls to the crabbed sailor. "Wisha! I wish it was potteen, or whisky itself, for your sake, if I have to go back every step of the way for more. God refresh you with it, and don't be cross to the wife, Andy. She has an *impression** about her heart with the wakeness, and I tould her not to hurry. I'll put the paytees down for you before she comes, if you like, for shrimping's hungry work."

"Granny, I brought your share and my own this time," exclaimed another, addressing an old woman, "and didn't feel it much; only I think I'll bring yours in the morning, and our own in the evening."

"Let us go," said my friend.

I paused to look one moment at the beautiful sunset, which steeped the roofs of the fishers' huts, as they lay crouching and crowded together—in molten gold; beyond lay the sea, as I have shown in Burnt Eagle's history, a liquid rolling living mine of wealth, and yet those poor creatures could hardly subsist; there was no one to teach *them* how to husband the treasures the mighty deep almost cast upon the shore; they possessed heart and feeling, the drink of water was given with a good will, that to *my fancy* converted it to nectar, and that girl had managed the crabbed sailor so well, that he positively smiled upon his wife, and offered to take her pitcher; and yet those *feeling* creatures could go day after day, year after year, to the hill-spring, and never take the trouble to discover if really the gushing waters of a well were buried beneath the thorn-tree.

Which is most necessary, I inquired of myself, to

* Oppression.

the well-doing of a community, reason or feeling? It cannot prosper without the exercise of both.

"It is the worst case," I said aloud at last. "This 'it was always so' is decidedly the worst case I have met with in Ireland. Why did not your father excavate this well?"

"Oh, my father has something else to think about — 'it was always so.'"

I could not help smiling at my friend's unconscious repetition of the to me obnoxious sentence, and sighed when I thought how much the character indicated by these four little words, ran through the country.

I slept and dreamed of bright bubbling springs, and awoke before sunrise. I looked out of the window, and saw two crows; every body in the world knows it is lucky to see two crows, particularly before sunrise; indeed, those who have a great deal to do will find it "lucky" to see any thing before sunrise, either a single crow or a single magpie; but having seen two crows, I felt bound as an Irishwoman to be exceedingly rejoiced at the good omen, and therefore summoned the only allies I could depend on, my own maid, and an old man, who, according to his own account, knew and respected "my people" before I was born. Having succeeded in rousing them from their slumbers, we proceeded to the old thorn-tree, but unfortunately there was only one fisherman on the beach, and my inquiries touching the well were not likely to be very successful.

"Did you never hear there was a well near that tree?"

"A well, is it?" "Yes, a well."

"Oh, sure they fetch every sup of water from the hill-spring."

"I know they do; but there is a well, or there was a well, somewhere herabouts."

"Myself don't know."

"Did you never hear that there was a well long ago under that thorn-tree?"

"Myself has no call to the tree; it's on Nancy Cahill's ground, and nobody meddles with Nance; the tree 'was always so.'"

I was not pushed from my purpose by this hint of Nance's quarrelsome propensities. There were a number of cottage gardens, or what should have been gardens, grown into one, for the divisions were not even perceptible, and the thorn-tree grew, or hung, at the bottom of the one that appertained to Nancy Cahill. My ally could give me no information; "sure my honour knew he came from another country." At last we discovered a very old white-headed man asleep on some lobster pots in an almost bottomless boat; the lobster pots ought to have been set the over night, but the old man and his son had a very successful "haul" two nights before; and why they should be at the trouble to set and haul the pots, except when they wanted, did not enter into their calculations. However, he half arose and set me at rest as to the spot; close to the left of the thorn-tree the well had certainly existed, at least so his aunt Biddy had said.

"Did no one ever endeavour to open the well?"

"Bedad I don't know; it had no luck."

"How no luck?—was the water bad?"

"Is it the water? Bedad I don't know, I never heard tell; but I believe the stones or something gave way, and thin the water was choked. 'Sure it was always so;' they fetch all the water from the hill-spring; many a good tide I've lost, waiting for the women to fetch it."

"We are going to try and find the well."

"A yarra wisha! Sure it's a long way down, and on Nancy Cahill's field."

"Will you come and help us to try!—we will provide you a pick-axe."

"Oh, God bless yer honour, I was never used to that sort of work; I'm a fisherman!" and he laid himself down with an air of such lazy determination, that I saw nothing more could be done with him. The sun had risen before my old man James got to work, and the brightness of the grass over the spot the fisherman had pointed out, would have convinced anyone in the habit of watching the indications of nature, that water was at no very great distance beneath.

I must say we worked very hard, and the signs and ejaculations of my English maid were not the least amusing part of the exhibition. We soon found the clay clammy, then positively wet; anon, and little unwashed, undressed children came running forth, to look and wonder. Presently Nancy herself, with drapery floating in the fresh sea-breeze, made her way over a heap of mingled shells of oyster, periwinkle, limpet, and all the shells of the sea, and then through a stagnant pool, of any thing but sweet savour, and stood before me with a very sour expression of countenance.

"Well, Mrs Cahill, what will you give me for finding a well on your estate?"

"Plase yer honour, I never get any thing; how can I give —"

"Don't say that; you'll have fresh water to give to all your neighbours."

"Oh, sure I knew it was in it."

"And why did not you get it out of it? How old are you, Mrs Cahill?" This was an unfortunate question; I ought to have known better than to have asked it; her lowering brow soon showed me my mistake. "Well, you are five-and-thirty, I suppose. Mrs Cahill smiled. She was certainly fifty; so on thirty and the odd five being named, she smiled, satisfied that I intended no discourtesy.

"How old were you when you began to draw water at the hill-spring?"

"Oh, yarra! maybe five, not more."

"And since then you have spent two hours every day drawing water?"

"Is it two hours? Yarra wisha! nearer upon three, or maybe four, of a time I'd have a bit of washing or cleaning to do. Not often—"

"Well, say two: two hours a-day are fourteen hours a-week; that is 56 hours a-month, 168 hours a-quarter, 672 hours a-year! See all the time you have wasted—no fewer than 840 days in the course of thirty years!"

"See that now!" she exclaimed, with an air of provoking wonder, which, if she had not been an Irish woman, I should have called stupid.

"Two hours a-day, properly managed, goes a long way towards making a house comfortable."

"Anan!" exclaimed Mrs Cahill, sitting down upon her heels to watch our progress; when seated, as she would call it, comfortably, she said, "Ye're kindly welcome, my lady, to divert yourself as long as ye please at the well (since it's a well ye'll have it), but take care of the *ould tree*. My great-grandfather planted it, I've heard tell, for a shelter to the well, and I'd be sorry it was hurt, out of respect to his memory!" Now, was it not provoking that this woman knew of the existence of that well, had its tradition from her great-grandfather, and yet had spent so many of the best hours of her life going to the hill-spring? I liked her, however, for reverencing the *ould tree*. In a little time the whole population of the village turned out to watch our operations; old James plied his axe and shovel right well; the English girl plucked away the roots and flung aside the stones; young and old men, young and old women, looked on—some listlessly, some with anxiety; none offered to assist. "Come, will you not help?" I said at last.

"Yes, my lady, only we must go now to the hill-spring, or the fathers'll have no paytees in time for breakfast. God send you good luck, my lady"—and three or four girls went off.

"But you—you young man—poor James is tired; take the pick or the spade; it is for the comfort of you and yours we are thinking and working."

"God save ye, my lady, ye have a tender heart, and we'll go from this to Jericho to serve you; but in regard of labouring work, I was never used to it, madam. I'm a fisherman, my lady."

"And do you think I'm used to it?" said the maid, petulantly.

"Oh no, bedad!" was the reply. "We never thought you war used to any useful thing. Why, it's a pity you should trouble yourself, miss!"

"To think," she muttered, "that they will not help themselves."

"We must teach them patiently."

Still it was very provoking to see them lounging and loitering about. At last the water began to ooze forth.

"See that now!" exclaimed Nancy. "Who'd ha' thought it, and it all so covered up!"

"Sure it was always so," observed another. "In rainy times the water would shine through the grass; only, Mrs Cahill, ma'am, as the well was on your land, it wasn't our business to look to it."

"That's thrue for ye," said the crabbed-faced sailor; "sure I know myself it's not pace and quietness meddling with Nancy Cahill."

"What's that you say, you —," and Nancy seized a stone, which she would certainly have hurled at the last speaker, but that her arm was held down, while all exclaimed, "Oh, Nancy, for shame!—before the quality! Oh, Nancy!"

"Look," said the termagant, rising, and standing with her arms akimbo, "I'm a quiet woman, and a God-fearing, peace-loving woman; but by all the books that ever war shut and opened, if ye don't every one, barring the lady and her helps, quit my bit o' land, see if I don't!" I never shall forget the fierce expression of her countenance, as men, women, and children withdrew, muttering, "Sure it was always so," and left her in undisturbed possession of her estate.

"It's only a bit of a breeze," muttered James; "when it blows over, there's worse-hearted women in the world than Nancy Cahill." She watched progress for another hour.

"There's water sure enough, and I suppose it was always so; but look at the trouble yer honour has had, and not sure that the earth wont fall in again as it did before; think of that now!"

"The earth will fall in, certainly, again, if it is not prevented," I replied; "but I hope you are convinced that if a thousandth part of the time and labour had been spent in excavating the well, that was expended in fetching water from the hill-spring, the well would have been useful to this day."

"That's thrue," said Nancy.

The sun was high and fervent, so I went to my home for the time being, proud of my achievement,

and amused at the observations of my English servant.

"I never saw such people spending an hour upon what could be done in a minute; I wonder will they do any thing to the well while we are away—it really would not be believed in England!"

"And there really is a well?" said my friend; "I have heard so, but I remember papa saying it must all be a story, because, if it was not, surely they would have found it out. There is some legend, too, about it, at least I think so; I almost forget what it is—something about the first person who pulled the grass up over its mouth dying before morning."

"Surely," I replied, laughing, "not if they saw two crows the first thing after sunrise."

"There was, there is such a legend," she repeated; "I suppose they would not like to tell it you, lest you should laugh at them; but I really think the superstition had a great deal to do in the way of strengthening the 'it was always so' that you complain of."

We agreed to go down in the evening, and see if any of the people had continued what was so pleasantly commenced.

When the evening came, we rambled there; it was a fine night. From some particular cause, the arrival, I believe, of visitors in the neighbourhood, there was a demand for fish, and the men had set forth in their cobbles, but there were many women and children round the well. I was in great hopes that they had triumphed over their evil habit; I forgot for a moment that the habits of years are not often overcome in a few hours. One point was achieved: they were convinced of the existence of water, for they had turned down saucers, little dishes, or whatever utensils of the kind they could collect, over the plashy soil, and were dipping up the water so collected, and filling their kettles as fast as they could. Nancy was in capital humour: if the well really turned out to be a well, she had become a person of importance; but I thought she looked rather sadly at me.

"I ax yer honour's pardon," she said, as, after talking and advising, we were going away; "but, lady dear, which of ye was it pulled up the first grass?"

"I did, Mrs Cahill. Why do you ask?"

"Just out o' curiosity, my lady—a way I have," she crossed her hands over her bosom, and added in a solemn tone, "God mark ye to grace!"

This question and observation confirmed me in the belief I had gathered from the kind and anxious looks they bent upon me, that the foolish superstition had in a great degree cramped their exertions, and that a fear, peculiarly Irish, of being laughed at, prevented their telling me the fact.

I did not rise so early the next morning; and when coming down stairs, I saw Nancy's head thrust in through the hall door, which had a great dislike to close, partly perhaps from a feeling of hospitality, which even Irish hall doors seem to participate in, and partly from a certain awkwardness about the hinges, which, owing to their advanced age, were unwilling to move rapidly, if at all.

"Well, Nancy," I said, "I hope the well gave you plenty of fresh water this morning?"

"Y'a, then, it's myself is glad to see yer face so cheerful-like this morning, lady dear, thanks be to the Almighty for his mercy. Amen!" And once more she crossed her hands over her bosom.

"And pray, Nancy, why should my face not be cheerful?" I inquired.

"Yarra! it's myself doesn't know, so I don't; only the gentry sometimes do be putting long faces on themselves for nothing. And are ye brave and hearty* this morning, plase yer honour?"

"That I am, Nancy, thank you—never was better. I am always better in Ireland than any where else in the world."

"Why, thin, my lady," answered Nancy, quaintly enough, "if that's the way, it's a pity ye should ever leave it. Myself thinks there's some *charraun*† about ye; but, may be, my lady, like the rest of the English *furriners*, you don't believe in the *charrauns*."

"Oh yes, Nancy, I believe in a great many charms." Nancy advanced fairly into the hall, and throwing her grey hair back from her eyes with both hands, looked steadily in my face, exclaiming, "See that now!"

"Yes, Nancy, there is a great charm in the kindness and good nature of my poor Irish friends."

Nancy looked disappointed and yet pleased.

"There is a great charm in industry, a great charm in patience, a great charm in perseverance. If we had not persevered with the well, you would have been journeying to the hill-spring to the end of your days, but I will see that trouble prevented before I leave you. And, Nancy, if you will find me a four-leaved shamrock, I will promise faithfully to exert all my powers of belief in its charms."

"God bless you, my lady; sure I never had the luck of finding sich a thing as that! I wish I had. Oh my! but I'm glad to see you well, ma'am; and sure we'll have heart now to go on with the well ourselves, and God's blessing on ye!"

"And why had you not heart to go on with it before?"

"Oh, ma'am, there's no good in telling you; maybe you'd be putting it in a book."

"Perhaps I might, Nancy."

"Ah, my lady, I and my people always kept out of disgrace."

* Very well.

† Spell.

"Well, but, Nancy, sure they put St Patrick and your own Daniel O'Connell in a book, and kings and queens, and they never consider it a disgrace. When there's nothing wrong done, what harm can there be in telling it?"

"Wisha! that's thrue; Morgan Regan has the Life of Saint Patrick."

"Well, and there is nothing disgraceful to the saint in it."

"Wisha, no! that's thrue!"

"Well, then, do you not see, what possible harm could there be in putting the well in a book?"

Nancy paused; and then, as if a sudden idea had struck her, she exclaimed, "Maybe, as I know the rights* of it myself, I may as well tell you, for others will. Ye see, ma'am, long ever ago, before I was born, and my mother nothing but a dawshy slip of a girl running about the rocks, like our own *chilre*, one of the fisher boys picked a very swarthy-coloured child off a wreck, and by the same token the mast of the vessel was to be seen at low water, off Greystone Point, for many a long sunny summer day, and many a bitter short winter one. Well, the very night Michael Grime (that was the boy's name) brought the child to the shore, the very same night the well fell in!"

"But it might have done so if the poor dark child had not been saved. I dare say it had been in a bad state."

"Sure it was always so in the memory of man; and what would ail it to keep so, as it had done for scores of years?"

"My good Nancy, is not that tower more likely to tumble down now than when it was built?"

Nancy was, however, too cunning to be trapped. She saw the analogy at a glance, and would not give in.

"Myself doesn't understand them things, but the well fell in any way," she said, with a twist of her shoulders, adding, "and the people said it wasn't for luck."

"That I believe. How can any thing be considered for luck that does harm?"

"Ay, indeed. Well, the swarthy child—it was a girl—delighted in sitting by where the well fell in, in the hot sun, or under the bames of the old pale-faced moon, it was all one, picking up bits of grass or stones, and throwing them among the plashing water that hissed up out of the ground; and the roll of her great black eyes wasn't pleasant—and—"

I interrupted the narration by the question of "How did she live?"

"Is it how did she live? Oh, thin, I suppose up and down just with the neighbours; only, to be sure, the best bit and sup was saved for her who had no one to look to her, God help us! Well, ma'am, the people observed, as I heard tell, that the well filled up wonderful; and at morning dawn and rising moon the swarthy child was there, nor would she suffer any to meddle with her or her doings, only sit and sing her song, like the sighing of a breaking heart, and would stay whispering about the houses even in the people's sleep. Nothing would she do but gather stones and grass to put in the well, and sing."

"Do you remember hearing what the words were she sang?"

"Yarra, no; not all out. She sang with a furrin tongue. Only this much I do mind hearing—a wise woman intarparted part of it, and the sense was this, that she would die on the grass planted by herself over the well, and leave her curse to the first hand that pulled the grass she sowed, and the curse she left was full and heavy—that the hand that did pull it might be could before morning."

I smiled and held out my hand to Nancy, and with the feeling of an Irishwoman, no matter how rude or untutored, she pressed it to her lips.

"It isn't could, God be praised," she said, "but it's not as warm as yer heart." I am free to confess that the pretty compliment softened the expression of Nancy's features wonderfully in my opinion.

"And what became of the girl?" I inquired.

"She pined, and pined, and pined, as a bird might that left too soon its mother's nest, and at last I heard tell she grew a shadow, and used to wrap the ould red shawl round her head, and her eyes would glare out from it like bonfires of a St John's night—and at last she was found dead by the well!"

"Poor thing! And you never heard who she was?"

"Yarra, no! how should we? Some said one thing, some another. Many thought she was something of a mermaid, others— But, any how, there was no doubt of her being—"

"What, Nancy?"

"Something not right," answered Nancy, turning away.

"Stay, Nancy; is it possible that this circumstance gave rise to the superstition which prevented your opening the well?"

"Shooperstition!" repeated Nancy, greatly offended. "Yarra, ma'am! how can you call it shooperstition? didn't my grandmother know the well to fall in?"

"Granted."

"And the swarthy craythur, whatever she was, to leave her skin an' bones over it?"

"Granted."

"And her curse, that the first hand that removed the grass might be could before morning?"

* The truth.

"Granted."

"Sure, then, that's not shooperstition; it's real truth."

"My hand is not cold, and I pulled away finely at the grass."

"God save us! sure ye did!"

"Believe me, the Almighty loves his creatures too well to permit the foolish words of sinful people to act against those who love and trust him."

"May be so," said Nancy; "but was it always so?"

"Indeed it was. When you are in a passion, you wish a great deal of harm to your neighbours, and yet it does not come to pass."

"God forbid!" she exclaimed, crossing herself.

"Amen to that, good Nancy; and now, as I hope you are satisfied that I am alive and well this morning, go down to your house, stir up those lazy men and boys; you know, Nancy, they will work if you order them! And bring me a pitcher of well water for my dinner."

"Yarra, ma'am, clear water is very could in the stomach."

"Now, Nancy, don't begin to undervalue the water the moment you have obtained it; but I will promise you all something stronger if you work hard. Good porter!"

We never suffered "it will do" to rest until we had achieved it is done! And the well was done, a comfort bestowed, and a superstition overcome, at a very small expense of time and trouble. Nancy to this day is quite lady patroness of the well, and, like all lady patronesses, a trifle capricious and tyrannical at times; but the pure fresh water is there with its thousand blessings, and the "neighbours are practically convinced that even if a thing has been 'always so,' there is no reason it should continue to be 'ALWAYS SO.'"

CAPTAIN COOK AT OWHYHEE.

In a new Encyclopædia of Useful Knowledge, recently published in numbers at Paris, we find an article from the pen of a noted French voyager, M. de Rienzi, in which some curious light is thrown on the circumstances attending the stay of Captain Cook at Owwhyhee, the place, as all know, where that famous navigator met his unhappy end. The details that follow seem to have been picked up by means of personal inquiries among the existing generation of islanders, who keep in remembrance the most minute particulars relative to the death of Cook, having received the story from their immediate progenitors, in whose time the event occurred. There were especial reasons, indeed, why this catastrophe should leave a deep impression on the minds of the natives of Owwhyhee.

On the 30th of November 1778, Captain Cook first came in sight of the island of Owwhyhee, or Haouai, as it has been named by later voyagers. From the period mentioned, up to the middle of January, the captain continued to cruise about the shores of the island, trafficking frequently with the natives, who brought fish, bread-fruit, plantains, and various other kinds of provisions, to the two British ships, the Resolution and the Discovery. On the 17th of January, Captain Cook cast anchor in the bay of Karakakooa, the shores of which are covered with habitations, where the principal people of the island reside. Here, accordingly, the voyagers came in contact for the first time with the chiefs of Owwhyhee, and here, in the course of their stay, a succession of scenes took place which were unintelligible alike to Cook himself and to those who had to record their unfortunate close. The inhabitants (according to the original narrative of the voyage) exhibited the utmost delight on observing the intention of anchoring in the bay. "They came off in astonishing numbers, expressing their joy by singing, shouting, and the most extravagant gestures." At the same time, two chiefs of high rank came on board, and were followed by one of the leading priests, named Koah. The conduct of Koah on being presented to Cook was remarkable. "Being conducted to the cabin, he approached the commodore with the greatest deference, threw a piece of red cloth over his shoulders, and, retreating a few paces, made an offering of a small pig, at the same time pronouncing a discourse of considerable length. Red cloth is an article with which their idols are arrayed, and a pig is their common offering to the *Eatoos*. In the evening, the commodore, Mr King, and Mr Bailey, accompanied Koah on shore. As soon as they landed on the beach, they were preceded by four men, bearing each a wand tipped with dog's hair, and pronouncing, with a loud voice, a short sentence, in which the word *Orono* was very distinguishable." In a foot-note in the original narrative, it is further mentioned that "*Orono* was Cook's general appellation among the natives of Owwhyhee. Sometimes it was applied by them to an invisible being inhabiting heaven." The true explanation of this title, and the cause of its

application to Captain Cook, may now be adverted to, before noticing the further homage bestowed on the commodore under the directions of Koah, and which the voyagers plainly saw to be of a religious nature, though they understood no more respecting the ceremonial.

Under any circumstances, a strong sensation would naturally have been caused among the natives of Owwhyhee, by the arrival of such objects as the British ships; but the sensation was increased ten-fold by a tradition of the island, with which the natives connected the advent of the voyagers. "Many years previously," says M. Rienzi, "a great chief, named Rono (or *Orono*, as it is set down in the original narrative) exiled himself voluntarily from Owwhyhee, but, ere he went, he announced prophetically to his countrymen that he would one day return upon a floating island, bearing (or large enough to bear) cocoa-trees, hogs, and dogs. His words were believed, and Rono, deified in his absence by the superstition of his countrymen, became annually the object of a great festival, held chiefly to perpetuate the remembrance of his promise to return. Wrestling, racing, and other similar exercises, accompanied the celebration of this fête, which gradually became a most important affair in the island. When the Resolution and Discovery appeared off their shores, it was not unnatural for the islanders to imagine that the floating isle of Rono had at length come. In truth, while the ships cruised around the coasts, the impression spread universally through the island that Cook was the long-expected god Rono, and hence the extravagant joy of the natives on his anchoring in the bay of Karakakooa, as well as the homage which the high-priest Koah caused to be bestowed on him."

With this explanation, the reader will easily understand the nature of the rites, which were meaningless in the eyes of Cook and his friends. The original narrative states, that after Koah and the commodore had landed, as already noticed, all the inhabitants either disappeared or prostrated themselves before the party as it marched onwards. Under the guidance of Koah, Cook and his friends reached what the narrative calls a *Morai*, or sacrificial temple. They were then conducted to the buildings or scaffolding on the top of this *Morai*, which "was a square solid pile of stones, of the length of four or five yards, the breadth of twenty, and the height of fourteen. Here Captain Cook was received by a tall young man, having a long beard, who chanted a kind of hymn, in which he was assisted by Koah." This hymn appears to have been a national one recording the history of Rono and the cause of his exile. M. Rienzi gives a translation of it, as still sung by the natives. It is in separate verses, as follows:—1st, Rono of Haouai, in former times, lived with his wife at Karakakooa. 2d, Kai-ki-rani-ari-oponna was the name of the divine object of his wedded love. A steep rock was their dwelling. 3d, A man ascended to the summit of the rock, and, when there, spoke thus to the wife of Rono:—4th, O Kai-ki-rani-ari-oponna! thy lover salutes thee; deign still to favour him, discard others, and he will remain thine for ever. 5th, Rono, overhearing this deceitful language, killed his wife in a moment of fury. 6th, Struck with remorse for his cruel act, he carried to a tomb the lifeless body of his wife, and wept long over her. 7th, Then, incited by a mad phrenzy, he ran over Haouai, fighting with all whom he met. 8th, And the astonished people said, 'Is Rono then mad?' and Rono replied, 'Yes; I am mad on account of Oponna, on account of my great love for her.' 9th, Having instituted games to honour the memory of his well beloved, Rono then embarked in a triangular canoe, and sailed towards far-away lands. 10th, But, before departing, Rono prophesied thus:—'I will return in future times, upon a floating isle, which shall carry cocoas, hogs, and dogs.'

To return to the original narrative. When the hymn of Rono was finished, "we were led to that side of the *Morai* where poles were erected; at the foot of which, twelve images were ranged in the form of a semicircle; the middle figure having a high table before it, on which we saw a putrid hog, and under it some cocoa-nuts, plantains, potatoes, bread-fruit, and pieces of sugar-cane. The commodore was conducted under this stand by Koah, who, taking down the hog, held it towards him; when, having again addressed him in a long and vehement speech, he suffered it to fall upon the ground, and ascended the (upper) scaffolding with him, though at the peril of their falling. We now beheld, advancing in solemn procession, and entering the top of the *Morai*, ten men bearing a live hog, and a piece of large red cloth of considerable dimensions. Advancing a few paces, they stopped and prostrated themselves; and Kaieekaea, the tall young man already mentioned, approaching them, received the cloth, and carried it to Koah, who wrapped it round the commodore, and made him an offering of the hog.

Captain Cook was now aloft, in a situation truly whimsical, swathed in red cloth, and scarcely able to keep his hold in the rotten scaffolding." After a long alternate chanting from Koah and Kaieekaea, the commodore was again brought down to where the images were. In his delight, apparently, at having

the real living Rono to adore, Koah "expressed himself in a sneering tone to each of them, snapping his fingers at them as he passed." But to the image in the centre, which was a higher idol than the rest, being the figure of Rono himself, Koah prostrated himself, and kissed it, which Captain Cook did also, at the priest's request. The ceremonies were concluded in another part of the Morai, where Captain Cook, seated between two idols, was chanted to as before by the two chief performers. But "their speeches and responses, we observed, grew gradually shorter and shorter, and towards the conclusion, Kaireckee's did not exceed three or four words, which were answered by the word *Orono*."

In this manner was Captain Cook formally deified, as the living incarnation of the god Rono, or rather as the returned chief in person. The original narrative of the voyage says respecting this scene, "Of the singularity and novelty of the various ceremonies performed on this occasion, we can only form conjectures; but they were certainly highly expressive of respect on the part of the inhabitants, and, as far as related to the commodore, they approached to adoration." On a future occasion, when the captain went on shore, he was conducted to *Harree-no-Orono*, the house of Orono, where the above rites were repeated. Indeed, "while we continued in the bay (says the narrative), whenever the commodore came on shore, he was preceded by one of the priests, who proclaimed the landing of the *Orono*, and ordered the inhabitants to prostrate themselves. He was constantly attended by the same person on the water, where he was stationed in the bow of the boat, having a wand in his hand to give notice of his approach to the natives who were in canoes, on which they instantly ceased paddling, and fell on their faces till he had passed." All showed awe and terror in his presence. But their adoration was not confined to empty homages. Canoes laden with hogs, vegetables, and every kind of provisions, "were regularly sent to the ships. Nothing was demanded in return, nor was the most distant hint ever given that any compensation was expected." On inquiring from whom came all these stores, it was answered that they were sent at the expense of Kaoo, the chief-priest, then absent on an excursion with the sovereign of the island, who was named Teareebou.

On the 24th of January, Teareebou returned, and like the others, he hastened to show his reverence for the living Rono. He had a formal state interview in a tent with Captain Cook, and bestowed on him various rich feathered-cloaks, as well as hogs and other presents in clothing and food. The king continued to show the same feelings towards the voyagers, and the narrative says, that "to relate all the instances of generosity and civility which they experienced, would require volumes." But, at length, the enormous consumption of hogs and other provisions by the crews began to alarm the monarch and people of Owhyhee, and considerable anxiety was shown as to the probable time of Rono's departure. That event was fixed for the 4th of February, and previously to its occurrence, the king bestowed large presents on the commodore. Every one of the natives testified regret at parting with the crews, and all was good-humour and kindness.

But the ships met with squally weather on their departure, and were obliged to put back, on the 11th of February, into the bay of Karakakooa. Here they did not find the same warmth of feeling displayed as on their previous stay. The undeniable fact seems to have been, that the natives were afraid of a famine falling upon the island, through the enormous wants of Rono and his followers. This cause, at least, made the king and the chiefs shy and timorous, although the former waited respectfully on Captain Cook next day. As if guided by their sovereign's conduct, the natives then began to "renew their usual friendly intercourse" with the strangers. But, on the 13th, certain untoward circumstances took place, which were attended with most lamentable consequences. Various repairs being required by the British ships, both carpenters and sail-makers had been sent on shore for the furtherance of their respective operations, and the position chosen for this purpose was the ground around the Morai, where the observatory also was erected, under the guard of a corporal and six marines. The ground around the Morai being *tabooed*, or rendered sacred from intrusion, by the priests, no disturbance at first occurred at this spot. It was a watering-party sent on shore from the *Discovery*, which first fell into collision, on the afternoon of the 13th, with the natives. No injury to either party resulted, however, as Lieutenant King got peace restored by an appeal to some of the chiefs. Amity had just been restored on shore, on this occasion, when Captain Cook landed in his pinnace, and, nearly at the same moment, all eyes were turned to sea, where a native canoe was seen flying to the shore, pursued by one of the *Discovery's* boats, and fired on repeatedly by musquetry from that vessel. Thinking this a case of theft, Captain Cook ran with an attendant or two to seize the depredators as they landed, but, being too late for this purpose, he sent some men into the country after the offending natives, who were hotly chased till it was dark. This was unfortunate, as the stolen articles had already been given up. Another mistake, and a much more unfortunate one, was committed by the officer who came in the small boat from the *Discovery*, in pursuit of the pilferers. This officer seized a canoe on the beach, and would not give it up to the owner, Pareea, a most influential

chief, who declared himself blameless in the matter of the theft. The officer was obstinate, and a scuffle ensued, in which Pareea was struck violently on the head with an oar. As this very chief had been one of the most ardent and generous friends of the British, all the natives within sight were roused to fury by the injury done to him, and attacked the strangers so fiercely that every man must have perished, had not Pareea himself timeously regained his senses, and interposed to save them. The belief in Cook's divine power was made strongly apparent by Pareea's conduct on this occasion. In place of feeling anger at the injury done to himself, "he expressed much concern at what had happened, and begged to know if the *Orono* would kill him?" Though the matter ended thus peaceably at the time, the attempt to seize Pareea's canoe, and the injury done to his person, were mainly instrumental in raising the cry of ingratitude against the British, and in preparing the minds of the natives for next day's scenes.

On the morning of the 14th, the *Discovery* communicated to Captain Cook the information that its cutter had been stolen in the night-time. This seemed to the resolute commodore an event of sufficient importance to call for decisive measures, and, accordingly, he resolved to get the king and his youthful sons on board, as hostages for the missing property. This plan Cook had frequently tried with success on previous occasions of the like nature. Between seven and eight o'clock A.M., Captain Cook proceeded on shore, accompanied by a lieutenant of marines and nine men. On entering the village where the king had his residence, the British leader was received with respectful prostrations as hitherto, and offerings of small pigs. As the king and his sons had been on board the *Resolution* almost every day, the captain hoped that his true design would not be suspected; and so it partly turned out, as the old king and his two sons consented at once to go on board. In truth, the two princes had reached the sea-side, and had set foot on board the commodore's pinnace, when affairs suddenly assumed a new aspect. Owing to the unwonted appearance of the armed boats of the ships, which had been stationed by Cook across the bay, a great crowd of natives had been drawn to the beach, and suspicions of latent treachery seemed to be spreading among them. It is probable, however, that no expression of this feeling would have appeared, had not one of the old king's favourite wives followed him towards the shore, and entreated him, with tears, not to go on board. She was joined in her request by several chiefs, and the king became dejected and irresolute. Captain Cook pressed him for some time to go, but finally gave up the attempt, seeing that the object could not be effected without much bloodshed. Having come to this conclusion, the commodore moved slowly from the king's side towards the pinnace with his party, but he was doomed never to reach it. Unfortunately, the armed boats in the bay, fulfilling their orders, had fired on some transgressing or straggling canoes, and had killed a chief of consequence. The tidings of this loss reached the natives as they were gazing on Cook's departing steps. Convinced now of the ingratitude and hostile intentions of the British, and irritated beyond measure, the natives seized their arms, and rushed on Cook and his marines. The commodore faced the first native who advanced, and ordered him to retire; but the savage repeated his menaces with stone and spear. Cook fired a load of small shot at him, but the war-mat of the islander rendered the discharge harmless, and the assailants became only the more daring. The captain again fired, and the ball with which the second barrel was charged brought down the savage. The whole of the marines now fired in self-defence, and the armed boats near the shore also fired. Amid the scene of bloodshed and confusion which ensued, Cook turned round to the boats, to order the firing to be stopped. Hitherto no man had struck the *Orono*; but when his countenance was turned away, the iron spear of a savage was driven into his back, and the great navigator fell to rise no more.

As the subject of Captain Cook's visit to Owhyhee has been adverted to here chiefly on account of the light thrown upon it in the French work mentioned, we shall merely notice in conclusion one or two passages in the original narrative, which corroborate the explanation given of the story of Rono or Orono. All that the survivors of Cook ever saw of his remains, eagerly as they sought for them, consisted of his disjointed bones, and a shapeless mass of flesh, about nine or ten pounds' weight. The rest, it was said, had been cut to pieces and burnt. This was the account given by a native who had been the commodore's attendant on all ceremonies, and who, when he brought off the fleshy relic just mentioned to the ships, "lamented, with abundance of tears, the loss of the *Orono*." He afterwards asked, "with great earnestness and apparent apprehension, 'when the *Orono* would come again, and what he would do to them on his return?'" The same inquiry was frequently made by others, and there can be no doubt, that, notwithstanding the rash violence which caused them to assail him, the natives were afterwards deeply afraid of an angry reappearance of the *Orono*. The probability is, however, that the repeated sight of similar "floating islands" to those of Cook, would greatly weaken the force of this superstition in the course of succeeding years, although neither the history nor the worship of Rono are yet forgotten in Haouai.

Unquestionably, the deplorable end of Captain Cook

was an event less to be ascribed to any evil passions on the part of the poor natives, than to the unfortunate accidents which aroused their anger momentarily against those whom they had loaded with kindness and favours. Had the voyagers understood the true nature and full extent of the feelings which led the natives to name and to treat Cook as they did, the pacific influence of the *Orono's* divinity might have been tried, and might have averted the fall of him, who, if not divine, was at least a great and good human being.

LE LOCLE AND THE LOCLEOIS.

[We lately presented some interesting particulars from Mr Symons's "Arts and Artizans at Home and Abroad" respecting the working-people of Switzerland, whom that writer represents as the most intelligent and contented in the world. We may here add, from the same work, a very remarkable fact illustrative of the comfortable state of these people. "A few months ago, during a high wind, the most windward house in the village of Herten (Appenzel) took fire; the houses were all of wood, and in a few hours the entire village was burnt to the ground. The loss of property was estimated at 400,000 florins (equal to £50,000); and as the place was occupied almost entirely by the labouring classes, a liberal subscription was immediately raised for the relief of the sufferers. When the distributors of the charity tendered the offered aid, to their great surprise they found but 140 individuals, not half the population, who required any relief, the rest having been received by their various relatives into their houses; an assistance which, added to the savings of the sufferers, enabled them to dispense wholly with the bounty of their neighbours." We venture to say that there is not a village in Great Britain, where the same independence of public bounty, under similar circumstances, would have been shown. As a proof of how much the contrary results might be expected amongst us, we can state as a positive fact, that, in a Scottish royal burgh of about 2000 inhabitants, 140 families (not much less than a *third* of the population) were found last winter ready to receive a portion of fifty pounds which a neighbouring gentleman sent to be distributed amongst the poor of the place, on acceding to his estates. The picture of sober industry, and consequent comfort and happiness, presented by the enlightened and universally productive Swiss, is so delightful to contemplate, that we feel much pleasure in laying before our readers the following letter, by an English gentleman resident in Le Locle, in the canton of Neuchâtel, descriptive of that village and its inhabitants.]

SWITZERLAND generally offers so few inducements as a winter residence to those of our country-people who seek a brighter sky, that I may very reasonably presume that our sojourn amid the snows of the Jura was the *premier coup-d'essai* [first attempt]; yet to true lovers of nature, a mountain country, at all seasons, affords so much of the sublime and magnificent, that, if tolerably robust in health, they cannot fail to derive enjoyment from the objects around them.

This elevated region, though tame when compared with the Oberland Alps, is not wanting in natural beauty, nor can it, in another point of view, be devoid of interest to the casual visitor. It includes the watch-making district of the canton of Neuchâtel, a scene of extraordinary industry, not often visited from curiosity. The monotony of our mode of life consequent to the season in this climate, will leave me but little to describe beyond the mere localities; but what we could glean of the habits of this people, who during a long winter were fully engaged in the various branches of an art which for many years past has been to them an increasing source of wealth, can scarcely fail to be acceptable to those who feel interest in the busy movements of the human hive.

The chief places of this district, which is included in the principality of Valengin, an hereditary possession of the king of Prussia, are Le Locle and La Chaux de Fonds, villages of six and seven thousand inhabitants. Le Locle, where we are now domiciliated, has been rising rapidly during the last eighteen months from the ashes of a dreadful devastating fire, which but for the intervention of two or three stone houses built some years ago from the first produce of the industry which now animates the whole range of these valleys, would have entirely erased the village. Lofty stone houses, with numberless windows and tall pyramidal roofs, each accommodating several families, even to as many as eight, the roof containing the necessary storerooms and lofts, now replace the ill-shaped wooden buildings of their forefathers, and though rather unsightly buildings, they are well suited to the climate and occupations of the inhabitants. The original village consists of one street nearly a mile in length, which is the principal thoroughfare; to this have been added a spacious market square, and several parallel and transverse streets. The old town-house is not in keeping with these alterations, nor is the church, though a large substantial edifice, sufficient for the increased and increasing population. Improvement in both these objects is expected to be brought under consideration when the ravages of the fire are recovered from.

On descending into Le Locle, after dark, a singular scene, resembling an illumination, presents itself; every window of the lofty houses is occupied by a workman with his lamp; even the cottages on the surrounding hills are seen glittering through the dark pine forests from the same cause, and afford to a stranger a striking proof of the industry of the inhabitants.

All summer-travellers in Switzerland have remarked the abundance of sparkling water with which its towns

and villages are supplied, and here indeed it does seem to run to waste from as many as twenty-four public fountains, some of which are of tasteful design.

The peculiarity of this narrow valley, which is three thousand and eighteen feet above the sea, is its enclosure on all sides, without any outlet, by precipitous green hills rising five and six hundred feet, backed by pine forests to double that height. Its length is somewhat more than two miles, and it varies from three hundred yards to a quarter of a mile and more in width. The Bied, a small rivulet, runs through its whole length, and loses itself in one of the natural caverns with which this limestone formation abounds; within its subterranean recesses are constructed mills for grinding and sawing, of rather primitive mechanism; but it is an effort of curiosity to explore this yawning abyss, where a false step would be fatal. The noise of the machinery and the rushing waters, combined with the darkness, which the twinkling lamp you are provided with seems only to render more apparent, are enough to appal an uninitiated visitor, and few strangers venture down its slippery ladders and dripping galleries.

I must give our own experience of the climate, which, from what I can learn, varies little from year to year. The winter may be said to have commenced with us early in October, and the spring brought little genial warmth until the month of May. Upon the arrival of the first fall of snow, sledges were taken into use, and continued their reign until the end of March, when the rains converted the streets into rivers of melting snow; during this long interval, every thing was effectually frost-bound, and the cold truly intense, the thermometer frequently showing ten degrees, and twice, during a dense fog which filled the valley, twenty degrees below the zero of Fahrenheit's scale. I must not forget, however, to mention that during the month of December we were favoured with twenty-four successive days of clear sunshine, and the calm which usually prevailed, rendered the extreme cold very bearable, and, unless it was attended by fog, there was no obstruction to daily exercise, and but little inconvenience was felt. Le Locle is in the latitude of forty-seven degrees, and the intensity of cold experienced there, is attributable to its elevated situation, and the want of circulation of air to relieve it from the occasional fogs which visit it. The substantial character of the houses, and the oven stoves with which each room is furnished, together with double glass windows, permit a very equal temperature to be kept up within doors. Open fire-places are not in favour, as they would not diffuse the same general warmth; nor is the peat, which is the common fuel, so applicable to them.

It is difficult to imagine so numerous a population as we are surrounded with, all fully employed upon one sole object, but the various branches of labour are almost as numerous as the separate parts of the machine to be made, thus occupying both sexes of all ages and degrees of talent and proficiency; for, as in Geneva, the trades and domestic arts are all provided for by strangers, mostly from Germany, or the German cantons of Switzerland, and a few Jews.

The watch-merchants, as they may justly be called, are but few; two or three houses carrying on the great export trade which provides for the disposal of not less than forty-five thousand watches annually; this prosperity has existed for several years, and seems yet on the increase, and, since all the tools are now made within the district, the imports are reduced to the necessary metals only, of which the quantities cannot be very large, and are drawn from France and England. This wholesale manufacture of watches excites a certain degree of interest. Once an article of luxury, the watch has now become a necessary, and in a moral point of view it would tend to show that the progress of education and refinement has at least taught the value of time, and, may we not equally hope, the advantageous use of it. Here they are made from the most inferior description, of ten francs' value, to the finest chronometer for purposes of science, selling at twelve hundred; but it is of the intermediate qualities for which the enormous demand exists, namely, flat watches of most exquisitely delicate and perfect workmanship, as well as other pocket watches and repeaters of less costly character. The whole business is conducted on the spot, or in the adjoining mountain hamlets, but always in private dwellings, where the females and children, in the intervals of domestic occupation, have each a separate department. Attempts have been made by greedy speculators to establish manufactories, but, happily for the health and morals of the young, they have hitherto failed. Grinding and polishing the chrysolites and rubies, which are so much in use for all fine watches, besides polishing, and in some cases finishing, the minuter parts, is the work of the women; the cutting out and forming in the rough, of much of the machine, is done by children, while the adapting and perfecting the whole belongs, comparatively, to a few, and they are the master workmen.

A vast number of the inferior articles just mentioned are annually spread, through German means, over the whole of Europe, while the two Americas and France swallow up almost all the better qualities. Indeed, it has been ascertained, upon the best authority, that the latter country is entirely supplied from Switzerland, including Geneva. We all know that comparatively few reach England, and that the few are generally smuggled in, the protecting duty of twenty-five per cent. ad valorem amounting nearly to

a prohibition; but as a proof that some few are speculated upon for the London market, I saw a small number in the maker's hands bearing the names of first-rate houses in our metropolis. The ingenious imitative Chinese are still indebted to Switzerland, but, for their independent taste, the watches must be made in pairs, and wholly of steel, or other white metal.

The temperate and industrious habits of this yet simple people would render any sumptuary laws unnecessary. They allow themselves but little time for amusement. Two clubs, where the men meet almost every evening in winter from six till nine o'clock, to read and discuss the news of the day, and play at cards or billiards, seem to occupy their only leisure. Gambling is totally unknown. At this season the women very rarely leave their homes. Many who are in easy circumstances have no servant (more than one is looked upon as an unpardonable advance in luxury among the most wealthy), and appear to be sufficiently occupied with their families and domestic duties. It is on Sunday, after the church-service, that family meetings take place, when they dine and sup together. Their hours are still very primitive; to dine at noon is the general custom, and this is little deviated from by the most luxurious.

For their charitable institutions and schools, the people of Le Locle deserve high encomium; they are supported entirely by voluntary contribution in the shapes of donation or subscription, and are managed by committees who meet weekly or oftener. We hear of no paupers but those who are provided for in the hospice or asylum, and they are all aged and infirm, and mostly widows. The orphan school generally contains about two hundred children, who are clothed, educated, and brought up to useful callings. These institutions are much beholden to the unremitting attention paid to them by the two amiable and worthy *pasteurs*, who are truly indefatigable in these and all their other duties; and it is pleasing to witness the respect and esteem which their characters and deportment have obtained for them from all ranks of their parishioners.

We are kept *au courant des nouvelles* by the daily arrival of a post from Neuchâtel and Pontarlier, and a diligence from Besançon, besides the communication twice a-day by an omnibus with the sister village of La Chaux de Fonds, all on sledges. In spite of the obstructions the diligence must meet with on the mountain passes they have to cross, they are seldom much retarded, and generally find their way without accident, travelling by day only. The number of travellers is but small during the inclement weather, and a journey over these heights is truly a work of suffering; the mail in winter being a small ill-closed vehicle, carrying a pair of wheels, which are applied whenever the sledge fails, necessarily the case in the lower grounds towards the end of the season, whilst the upper regions still continue many feet deep with snow.

Notwithstanding the extensive forests by which we are surrounded, there are exceedingly few wild animals in this district, no large game, neither bears, wolves, nor wild boars. Some of the keenest sportsmen of this place succeeded in bringing home a hare or two; but the native partridge is exterminated, and woodcocks do not visit in any number. During the month of January, some traces in the snow gave notice of the arrival of wolves, the freezing over of the river Doubs being their usual passport from Franche Comté. Two were soon after seen by some travellers, but, although watched, and a general battue made by the inhabitants of the neighbouring hamlets, who are all excellent marksmen, the marauders managed to escape back into France without molestation, and also without having done any mischief. They are at this season usually in a most ravenous state, and are much feared by the country people.

Our nearest neighbouring village, Les Breuils, another abode of watchmakers, on the frontier of the canton of Neuchâtel, towards France, is most pleasantly situated. The river Doubs flows at its foot; the road to it from hence (a distance of about four miles) is over an elevated pass through majestic pine forests, and is exceedingly picturesque. During the spring and summer it is much visited, both by natives and strangers, on account of the *Saut du Doubs*, a spot about two miles lower down the stream, where the river falls abruptly from a height of nearly a hundred feet, forming a magnificent cascade, with all the due accompaniments of spray and rainbow in profusion. The river Doubs, which is here enclosed by bold rocky cliffs, partially clothed with beech and pine, rising three and four hundred feet perpendicularly, forms a succession of basins or small lakes, which were frozen over early this winter, and parties have been made, from Le Locle, to skate and drive in sledges on these fine sheets of ice. A tolerable *auberge* near the waterfall, which is always well provided with fine fish, especially trout, does not fail to attract many visitors at all seasons.

La Chaux de Fonds is five miles from us, and resembles Le Locle in most respects. Its greater elevation renders its climate yet more severe, but it is at the same time freer from fog. It was rebuilt some years ago, having also been nearly totally destroyed by fire; it is about as many years in advance in luxury as have occurred since that catastrophe; the wealthy, who are numerous, keep carriages, balls are encouraged during the winter, and it is even proposed to build a theatre. In real refinement and information, I still

question whether they have much taken the lead of their less ostentatious neighbours at Le Locle. Their political sentiments are of the ultra-liberal cast, and they were the most active in a late endeavour of a party in the canton to shake off the connection with Prussia.

PROPOSED IMPROVEMENTS IN ENGLISH AGRICULTURE.

WE were happy to learn through the medium of the newspapers about twelve months ago, that a number of intelligent and patriotic noblemen and gentlemen of England had at length seriously entertained the subject of agricultural improvement in that country, and formed themselves into an association, in order to carry the great objects they had in view into immediate effect. The model upon which this English Agricultural Society is formed, is the Highland Society of Scotland, which has been in existence for about half a century, and has been of incalculable benefit to the northern part of the United Kingdom, both Highlands and Lowlands. The Highland Society now numbers among its members almost every nobleman and landed gentleman in Scotland, and also many farmers and persons engaged in professional and commercial pursuits. It has, in fact, become an overwhelmingly powerful association of influential individuals, all animated with one ruling wish—to improve the rural economy of the country. Large sums are annually dispensed by the Society in conferring rewards for the best practical essays on processes of husbandry—the construction of improved implements—experiments in the economy of feeding live stock—investigation of the diseases of cattle—improvements in breeds of sheep—modes of draining and fencing—and a thousand other objects connected with the business of the agriculturist. Premiums to a large amount are likewise awarded at great annual exhibitions in different parts of the country; one of the features of these exhibitions being, that they are liberally supported both by the personal attendance and pecuniary contributions of the local gentry. And, to crown all, the Prize Essays of the association are published quarterly in an accessible form, in connection with the Quarterly Journal of Agriculture, at Edinburgh.

We have heard doubts entertained with regard to the real benefits conferred by the Highland Society; it has been alleged that the improvements in Scotch agriculture are to be traced to the anxious and isolated efforts of individual farmers, more than to any patronage afforded by this great association. It is, however, needless to go deeply into this question. The Highland Society has undoubtedly created and nourished a powerful emulative spirit throughout the country in favour of agriculture; has enlisted the entire body of gentry in the cause; raised the business of the husbandman to the dignity of a liberal science or art; promoted the growth of local agricultural clubs, and ploughmen's competitions, so that now, from one cause and another, any thing like bad farming would be looked upon as a disgrace. At the public meeting which took place some time ago for the establishment of the English Agricultural Society, Earl Spencer, in his speech on taking the chair, adverted to the benefits which had been derived from the institution of the Highland Society in the following terms:—"He would shortly," he said, "state the reasons which had induced him to wish that a society should be formed for the promotion of the interests of agriculture. He had seen and heard of the great benefits which Scotland had derived from the establishment of the Highland Society in that country. He believed that fifty or sixty years ago the agriculture of Scotland was decidedly inferior to that of England, but he need not tell them that this was no longer the case; on the contrary, he believed it must in fairness be admitted, that though there might be found farms in England as well cultivated as any in Scotland, no extensive tract of country in England could be found, in which the system of cultivation was so perfect as it was in the northern division of the kingdom. Even in the county of Norfolk there were only a few farms which could bear the comparison. He believed that this great and beneficial change, as regarded the agriculture of Scotland, had been mainly owing to the institution and exertions of the Highland Society. Every one who had visited the different parts of the country in England, must have seen the capacity for improvement which every where existed. Different modes of cultivation were practised in similar soils, and those, too, almost similarly situated. Both could not be right. It could not be right that four horses should be used at the plough in one place, and only two horses in another, and those under precisely similar circumstances. He thought that, by establishing a powerful society, having the means of communicating information throughout the country, reckoning among its members persons from the north to the south, and from the east to the west, they would be able at last to diffuse among the farmers of England a knowledge of the best mode of cultivating their land. But he would say he was sanguine enough to expect more—he trusted they would be able, by the combination of science and practice, to improve even the best cultivation that at present existed. He would tell them what he thought the best mode of carrying that object into effect. They must have a society established in the metropolis as a central society. They must have the power of corresponding with persons in every part of the

LIBRARY OF THE UNIVERSITY OF EDINBURGH

United Kingdom, as well as with foreign agricultural societies, and scientific men abroad, who had applied themselves to the study of this subject. He thought, then, the great object of the society should be the advancement of agricultural knowledge, and it was only by communicating with those who had attended to the subject, and by diffusing the knowledge so obtained to the farmers of England, that he expected the greatest benefits should be derived. But, besides this, it was imperatively necessary that they should have agricultural exhibitions in different parts of the country; for although agriculture should be the principal object, yet, to excite an interest in their favour, they must have meetings for this purpose. Now, he would beg to say, that to make this society effective, it must have powerful influence and co-operation; and it would be necessary that men of all parties should unite and act together."

The Duke of Richmond took a similar view of the subject, and in moving one of the resolutions "said he had ever felt that it was a matter of vital importance to the interests of agriculture that the improvements in science should be brought to bear upon it. Some person had mentioned that the farms of Norfolk were as good as those of Scotland; and if this were true, it only proved the necessity of establishing the proposed institution, for it was not contended that within a few miles of both those places the farms were cultivated at all. The Highland Society of Scotland was universally popular with the landholders in that country, and the reason was, because they never thought of discussing politics, but emulated each other in advancing the interests of agriculture. They had made the greatest improvements in it by irrigation, draining, and bringing waste lands into profitable cultivation, as well as by stimulating the industry of the labourers by the distribution of premiums. He was therefore justified in expecting that success would attend the present experiment, from the benefits which had been produced in another country from a measure of the same kind."

In conformity with resolutions adopted at the above meeting, the English Agricultural Society was formed, and is now in operation, with upwards of eleven hundred members. One of the most conspicuous evidences of its existence, has been the recent publication of certain papers and reports on a variety of agricultural topics, in the form of a Quarterly Journal; * and we observe that it has already issued a long list of subjects for prize essays, and for competition at annual shows, precisely on the plan of the Highland Society. A very considerable effort having thus been made towards the improvement of all branches of rural economy in England, it is anxiously to be wished that it may in due course of time be crowned with complete success. Whatever questions may be raised with respect to the policy of excluding foreign produce from our markets, it is clear that it would be highly for the advantage of England, if, at the expense of little else than additional skill and attention, a large increase in the quantity of human food could be annually extracted from the bosom of the soil. It is, for example, computed that on an average 26 bushels of wheat are raised from an acre of land; if, therefore, from a better selection of seed, or from a better mode of ploughing, this amount could be raised to 27 bushels, a total increase would be gained of 475,000 quarters, worth about £1,200,000. Far more surprising results have followed the improvements of Scotch husbandry; and we must never forget the startling truth, that Great Britain now supports 17,000,000 of inhabitants with the same ease that it supported 9,000,000 in 1780: the island has grown no larger in the interval, and there is no important variation in the importations of grain at the two periods. The increased means of subsistence is entirely attributable to agricultural improvement.

In a paper contributed to the Journal of the English Agricultural Society, by Mr John Dudgeon of Skilaw, near Kelso, we are furnished with a view of the progressive improvements in Scotch agriculture within the last fifty or sixty years, and also some details respecting the comparative reproductive powers of the soil now and formerly. The following is worth quoting:

"The reproductive powers of the improved system of agriculture, in comparison with that effected by the method of treatment pursued at the beginning of this inquiry, is no less conspicuous, and is also worthy of notice. Take, for example, the case of a farm of 100 acres, after the fashion of 1784, under its rotation of, 1st, fallow; 2d, wheat; 3d, barley; 4th, oats; 5th, peas; and similar land, now under a system of, 1st, turnips; 2d, barley or wheat; 3d, clover (hay); 4th, pasture; 5th, oats; and, estimating the weight of straw of the crops of both periods alike at 3 cwt. per qr., according to the estimated produce stated above, we appear to be justified in adopting the following result:—

	Tons.	Tons.
Crop of 1784. 80 acres grain, 4 qrs. per acre } 320 qrs. at 3 cwt. per qr.	48	
Crop of 1837. 40 acres grain, 54 qrs. per acre } 220 qrs. at 3 cwt. per qr.	33	
20 acres hay, 30 cwt. per acre } 20 do. turnips, 20 tons, do.	30	400
		463

Difference in materials for manure . . . 415

Thus, without taking into account the greatly less quantity of straw disposable for manure in the former case, from the want of other fodder, we have an in-

crease of reproductive materials equal to nearly ten times the amount of the first period."

The direct causes of this amazing increase, are, as is well known, improved modes of husbandry, particularly in draining and manuring, and attention to proper rotation of cropping. Fortunately, the desire for agricultural improvement in Scotland has encountered no opposition of any kind from any class of the community. The farmers generally, with only so much education as is to be obtained at the parish school, have in almost every quarter entered warmly into the spirit of improvement, and, favoured by long leases and capital saved from industry, have pushed cultivation to an extent which could not have been dreamt of fifty years ago. The farm-labourers, likewise, throughout the trying period of change, have in no case manifested either turbulence or veneful feelings, and hence the whole economy of rural affairs has advanced profitably and securely to its present comparatively finished condition. On Scotch farms, such as are common in East Lothian, Berwickshire, or Mid-Lothian, all processes of culture, and the entire preparation of produce for market, are conducted on an enlarged economic principle, so as to yield the largest possible quantity of material at the lowest possible charge—the profit of such a system being of course ultimately favourable to the consumer. A Scotch farmer of the new school, therefore, is, in point of fact, a manufacturer. His farm is a large grain factory, in which cheap automatic processes, as in the cotton factory, take the place of cumbersome manual labour. In the southern and other districts of England, you still hear the noisy din of the flail; but that venerable instrument has been long since banished from modern Scotch farming. The flail! Reader, think of the flail being still in use in England! The other day we visited the farm of Mr Allan at Pilton, within a couple of miles of Edinburgh, to inspect the operations of a rotary steam-engine, which had been lately applied to a thrashing machine. This machine, at the most insignificant cost for fuel and attendance, can thrash, winnow, and completely dress for market, a stack of wheat of thirty bushels in five hours.* According to the wretched practice in the south, this quantity of grain could not be thrashed with the flail in a less period than a month, at the expense of the wages of two men during that period. Facts such as this could be multiplied to any extent, in illustration of the extraordinary contrast between the improved Scotch and the English farming. We have little doubt that the English Agricultural Society will endeavour to introduce the various improvements which have proved so eminently successful in the north; and in doing so, they well deserve the support of every lover of his country, of whatever condition in life he may be. Our only fear is, that the great host of ignorant small farmers and peasantry will perseveringly oppose every attempt to advance, and, for some time at least, resolutely hold to the usages of a bygone age. But neither pains nor expense must be spared by the Society to obviate this external difficulty, the very existence of which reflects discredit on the whole country. It need hardly be hinted, that if primary education had been generally established in England twenty or thirty years ago, no such difficulty could now have been started; and hence the general education of the hitherto neglected portion of the people becomes a preliminary and necessary step to that agricultural advancement which is now felt to be desirable.

As this subject is one of much national importance, we shall from time to time recur to it, in connection with the appearances of the Journal of the English Agricultural Society.

DUEL FOR THE HONOUR OF ABERDEEN BUTTER.

Sir Walter Scott has alluded to the laird of Culrossie. "who fought a duel for the honour of Aberdeen butter" (Croker's Boswell, vol. iii. p. 38). Would that he had told the story! It goes that an English gentleman supping in a Glasgow coffee-room, ordered the waiter to remove the butter on the table and bring him better. The servant replied that his master had no better, for that was Aberdeen butter; and the Englishman was proceeding to growl in very audible terms at Scottish butter in general, and particularly Aberdeen butter, when a gentleman from a neighbouring box addressed him with "That's nae true; Aberdeen butter is as gude butter as e'er gaed down your ha'se!" The consequence may be imagined; a challenge was promptly given and as promptly accepted, and the parties met. In the combat, which was with the small-sword, Culrossie was worsted; but, after thanking his adversary for his life, he added, "I'll say yet, that better butter than Aberdeen butter ne'er gaed down a Southron's thrapple."—*Book of Bon Accord.*

ANTIQUITY OF SMOKING.

Small tobacco-pipes of an ancient form are frequently found in Ireland on digging or ploughing up the ground, particularly in the vicinity of those circular encroachments called Danish forts, which were most probably the villages or settlements of the native Irish. In the first volume of the "Anthologia Hibernica," there is a print of one which was found at Bannockstown, county Kildare, sticking between the teeth of a human skull; and it is accompanied by a paper, which, on the authority of Herodotus, Strabo, Pomponius, Mela, and Solinus, goes to prove that the northern nations of Europe were acquainted with tobacco, or an herb of similar properties, and that they smoked it through small tubes—of course

long before the existence of America was known. The arguments in favour of the antiquity of smoking receive additional support from the discovery of several small clay pipes in the hull of a ship found some years since, when excavating a new sluice-way, at the upper end of the Fairwater at Dantzic. The ship was discovered buried in the ground at the depth of about twenty feet; she measured, from stem to stern, in the inside, fifty-four feet, and in breadth twenty feet. A box of tobacco-pipes was found, all whole, with heads about the size of a thimble, and tubes from four to six inches in length. It is supposed the vessel had been lost in some convulsion of nature previous to the foundation of the city, which had been built over the spot at least five hundred years since.—*Newspaper paragraph.*

BARRING OUT.

MISS EDGEWORTH has founded one of her instructive stories for youth upon the custom of Barring Out, and those who remember that tale will be aware of the origin of the term. It arose from a practice, prevalent not very long ago in many parts of England, of barring out the masters of schools from the scene of their educational labours and of their birchen supremacy. The agents in this feat, of course, were the pupils of the seminary, and the deed was commonly done at a definite annual time, at Christmas in some places, and at Fasten's Eve in others. The master was usually kept out for the space of three days, if the boys, who barricaded every avenue to the place, and defended it like a besieged city, could maintain their ground so long. But the duration of the barring out was liable to variation, as well from the occasional defeat of the insurgents, as from the operation of other causes. The barring out was not a mere frolic, having fun only in view. If the boys could keep their teacher on the outside of the academy door for the full term of three days, the deposed dignity was bound by custom to enter into a capitulation with the youngsters, and to grant to them certain demands relating to the number of holidays for the ensuing year, to the allotment of the hours of study and recreation, and to other important points connected with the economy of the establishment. On the other hand, if the pupils failed in holding out the school-house against their assailants for the period of three days, the master admittedly had a right to dictate his own terms in all those matters which have been mentioned. He obtained also the momentous right of castigating at will the actors in the rebellion—a labour (of love, perhaps) which they always took care to save him in cases where they were successful, by making that point the subject of a very explicit condition in the act of capitulation. This document, it may be observed, was commonly drawn up in a formal and most diplomatic style, securities for the fulfilment of all its stipulations being provided on both sides, and signatures affixed by the master and the scholars, or by plenipotentiaries appointed by the latter for the purpose. The "high contracting parties" were then at peace for the year.

Being assured by many veracious authorities that barring out was a custom very general in England, particularly in the ancient burgh towns and large villages, and considering the practice to have been of frequent if not yearly recurrence, one cannot help wondering what notions of discipline the masters of such schools must have entertained sixty or seventy years ago, when the custom, we are informed, was still extensively prevalent, though not so common as at an earlier date. We are told, that, after the rebellion had fairly commenced, the teacher always made the most vigorous attempts to enter his school-house and subdue his insurgent vassals; but really the affair must have been half a joke, if not wholly so, and the gravity of his siege must have been of a mock cast, otherwise he would certainly have taken effectual precautionary measures against the occurrence of the business at all. The worthy gentleman's quiet submission in the first instance to a periodical rising of this kind, seems to us just such a piece of behaviour as if he had intentionally sat down in his easy-chair and pretended to be asleep, until the urchins in his train crept in, bound him hand and foot, and then picked his pocket of the school key; and as if, after these events, he had made mighty efforts to cast off his bonds and regain his lost authority. After all, the inexplicabilities of this practice of barring out must be set down mainly to the score of that "second nature, habit," which makes men and communities patiently tolerate gross abuses for immense periods of time, being blinded by the very familiarity of such abuses to their pernicious influence and consequences.

The grave and moral Joseph Addison is described by his biographers as having been the leader of a barring out at the grammar-school of Litchfield, and as having on that occasion displayed a degree of disorderly daring, scarcely to have been expected from one who afterwards displayed so well-regulated a temperament. This exploit was performed about the year 1684 or 1685. As the custom decreased in frequency, a barring out became naturally a more serious matter

* The Journal of English Agriculture, vol. I. part I. Murray, London.

* We propose, at an early opportunity, to describe Mr Allan's thrashing machinery.

than when it was an event that came round pretty regularly with Christmas or Fasten's Eve. The master's ire at his exclusion from the arena of his greatness became more real and sincere in its nature, and, on the other hand, the insurgent boys, knowing what they would draw down upon themselves, took all possible means to render their resistance effectual. Besides the usual steps of stealing the door-key, and of barricading the windows with benches, &c., they were wont to arm themselves with all sorts of missiles, and even to get pistols and other fire-arms into their hands, not for the purpose of killing their besiegers, certainly, but in order to keep them at a proper distance—the spectacle of a pistol muzzle having usually a powerful tendency to effect this object, as boys and men know. The master, in particular, would be likely to retreat at such a sight, being so totally unaccustomed to this mode of seeing the young ideas shoot. Provisions the young rebels always laid in. In place, however, of thus recounting the ways and means of a barring out, we had better present an account of a pretty recent one, communicated by a living actor in the scene to the *Gentleman's Magazine* for 1828, to which excellent periodical we acknowledge our obligations on this as on many other occasions. The date of the affair is not given, but it probably occurred about the commencement of the present century, when straggling instances of this strange practice were still turning up now and then, and here and there. The grammar-school of Ormakirk in Lancashire was the place where this barring out took place.

"It was a few days before the usual period of the Christmas holidays arrived, when the leading scholars of the head form determined on reviving the ancient but almost obsolete custom of barring out the master of the school. Many years had elapsed since the attempt had succeeded, and many times since that period had it been made in vain. The scholars had heard of the glorious feats of their forefathers in their boyish years, when they set the lash of the master at defiance for days together. Now, alas! all was changed; the master, in the opinion of the boys, reigned a despot absolute and uncontrolled. The merciless cruelty of his rod, and the heaviness of his tasks, were insupportable. The accustomed holidays had been rescinded; the usual Christmas feast reduced to a nonentity, and the chartered rights of the scholars were continually violated. These grievances were discussed one by one; and we all were unanimously of opinion that our wrongs should, if possible, be redressed.

At the head of the Greek class there was one whose very soul seemed formed for the most daring attempts. He communicated his intentions to a chosen few, of whom the writer was one, and offered to be the leader of the undertaking, if we would promise him our support. We hesitated; but he represented the certainty of success with such feeling eloquence, that he entirely subdued our opposition. He stated that Addison had acquired immortal fame by a similar enterprise. He told us that almost every effort in the sacred cause of freedom had succeeded. He appealed to our classical recollections; Epaminondas and Leonidas were worthy of our example; Tarquin and Cæsar, as tyrants, had fallen before the united efforts of freedom; we had only to be unanimous, and the rod of this scholastic despot would be for ever broken. We then entered enthusiastically into his views. He observed that delays were dangerous; the 'barring out,' he said, 'should take place the very next morning, to prevent the possibility of being betrayed.' On a previous occasion, he said, some officious little urchin had told the master the whole plot—several days having been allowed to intervene between the planning of the project and its execution; and to the astonishment of the boys, it appeared they found the master at his desk two hours before his usual time, and had the mortification of being congratulated on their early attendance, with an order to be there every morning at the same hour!

To prevent the recurrence of such a defeat, we determined on organising our plans that very night. The boys were accordingly told to assemble after school hours at a well-known tombstone, in the neighbouring churchyard, as something of importance was under consideration. Our leader took his stand at one end of the stone, with the head boys who were in the secret on each side of him. 'My boys (he laconically observed), to-morrow morning we are to bar out the flogging parson, and to make him promise that he will not flog us hereafter without a cause, or set us long tasks, or deprive us of our holidays. The boys of the Greek form will be your captains, and I am to be your captain-general. Those who are cowards had better retire, and be satisfied with future floggings; but you who have courage, and know what it is to have been flogged for nothing, come here and sign your names.' He immediately pulled out a pen and a sheet of paper; and having tied some bits of thread round the finger ends of two or three boys, with a pin he drew blood to answer for ink; and to give more solemnity to the act, he signed the first, the captains next, and the rest in succession. Many of the lesser boys slunk away during the ceremony, but on counting the names, we found we mustered upwards of forty—sufficient, it was imagined, even to carry the school by storm. The captain-general then addressed us:—'I have the key of the school, and shall be there at seven o'clock. The old parson will arrive at nine, and every one of you must be there before eight, to allow us one hour for barricading the doors and windows. Bring

with you as much provision as you can, and tell your parents that you have to take your dinners in school. Let every one of you have some weapon of defence; you who cannot obtain a sword, pistol, or poker, must bring a stick or cudgel. Now, all go home directly, and be sure to arrive early in the morning.'

Perhaps a more restless and anxious night was never passed by young recruits on the eve of a general battle. Many of us rose some hours before the time; and at seven o'clock, when the school-door was opened, there was a tolerably numerous muster. Our captain immediately ordered candles to be lighted, and a rousing fire to be made (for it was a dark December morning). He then began to examine the store of provisions, and the arms which each had brought. In the mean time, the arrival of every boy with additional material was announced by tremendous cheers.

At length the church clock struck eight. 'Proceed to barricade the doors and windows (exclaimed the captain), or the old lion will be upon us before we are prepared to meet him.' In an instant the old oaken door rang on its heavy hinges. Some, with hammers, gimlets, and nails, were eagerly securing the windows, while others were dragging along the ponderous desks, forms, and every thing portable, to blockade every place which might admit of ingress. This operation being completed, the captain mounted the master's rostrum, and called over the list of names, when he found only two or three missing. He then proceeded to classify them into divisions or companies of six, and assigned to each its respective captain, and its respective duties.

We next commenced an examination of the various weapons, and found them to consist of one old blunderbuss, one pistol, two old swords, a few rusty pokers, and sticks, stones, squibs, and gunpowder in abundance. The fire-arms were immediately loaded with blank powder, the swords were sharpened, and the pokers heated in the fire. These weapons were assigned to the most daring company, who had to protect the principal window. The missiles were for the light infantry, and all the rest were armed with sticks.

We now began to manœuvre our companies, by marching them into line and column, so that every one might know his own situation. In the midst of this preparation, the sentinel whom we had placed at the window loudly vociferated, 'The parson! the parson's coming!'

In an instant all was confusion. Every one ran he knew not where, as if eager to fly, or screen himself from observation. Our captain instantly mounted a form, and called to the captains of the two leading companies to take their stations. They immediately obeyed, and the other companies followed their example, though they found it much more difficult to manœuvre when danger approached, than they had a few minutes before. The well-known footstep which had often struck on our ears with terror, was now heard to advance along the portico. The master tried to lift the latch again and again in vain. The muttering of his stern voice sounded on our ears like the lion's growl. A death-like silence prevailed. We scarcely dared to breathe. He approached close to the window, and with an astonished countenance stood gazing upon us, while we were ranged in battle array, motionless as statues, and silent as the tomb. 'What is the meaning of this?' he impatiently exclaimed. But no answer could he obtain; for who would then have dared to render himself conspicuous by a reply? Pallid countenances and livid lips betrayed our fears. The courage which one hour before was ready to brave every danger, appeared to be fled. Every one seemed anxious to conceal himself from view; and there would certainly have been a general flight through the back windows, had it not been for the prudent regulation of a corps-de-reserve, armed with cudgels, to prevent it.

'You young scoundrels, open the door instantly,' he again exclaimed; and what added to our indescribable horror, in a fit of rage he dashed his hand through the window, which consisted of small diamond-shaped panes, and appeared as if determined to force his way in.

Fear and trepidation, attended by an increasing commotion, now possessed us all. At this critical moment every eye turned to our captain, as if to reproach him for having brought us into this terrible dilemma. He alone stood unmoved; but he saw that none would have courage to obey his commands. Some exciting stimulus was necessary. Suddenly waving his hand, he exclaimed aloud, 'Three cheers for the barring out, and success to our cause! hurra! hurra! hurra! hurra!' The cheers were tremendous. Our courage revived; the blood flushed in our cheeks; the parson was breaking in; the moment was critical. Our captain, undaunted, sprang to the fire-place—seized a heated poker in one hand, and a blazing torch in the other. The latter he gave to the captain of the sharpshooters, and told him to prepare a volley; when with the red-hot poker he fearlessly advanced to the window seat, and daring his master to enter, he ordered an attack—and an attack indeed was made, sufficiently tremendous to have repelled a more powerful assailant. The missiles flew at the ill-fated window from every quarter. The blunderbuss and the pistol were fired; squibs and crackers, ink-stands and rulers, stones, and even burning coals, came in showers about the casement, and broke some of the panes into a thousand pieces; while blazing torches, heated pokers, and sticks, stood bristling under the window. The whole

was scarcely the work of a minute. The astonished master reeled back in dumb amazement. He had evidently been struck with a missile, or with the broken glass, and probably fancied he was wounded by the fire-arms. The school now rang with the shouts of 'victory,' and continued cheering. 'The enemy again approaches,' cries the captain; 'fire another volley; stay, he seeks a parley; hear him.' 'What is the meaning, I say, of this horrid tumult?' 'The barring out, the barring out!' a dozen voices instantly exclaimed. 'For shame,' says he, in a tone evidently subdued; 'what disgrace you are bringing upon yourselves and the school! What will the trustees—what will your parents say?' William, continued he, addressing the captain, 'open the door without further delay.' 'I will, sir,' he replied, 'on your promising to pardon us, and to give us our lawful holidays, of which we have lately been deprived, and not set us tasks during the holidays.' 'Yes, yes,' said several squealing voices, 'that is what we want; and not to be flogged for nothing.' 'You insolent scoundrels! you consummate young villains!' he exclaimed, choking with rage, and at the same time making a furious effort to break through the already shattered window, 'open the door instantly, or I'll break every bone in your hides.' 'Not on those conditions,' replied our captain, with provoking coolness; 'come on, my boys; another volley.' No sooner said than done, and even with more fury than before. Like men driven to despair, who expect no quarter on surrendering, the little urchins daringly mounted the window seat, which was a broad old-fashioned one, and pointed the fire-arms and heated poker at him, whilst others advanced with the squibs and missiles. 'Come on, my lads,' says the captain, 'let this be our Thermopylae, and I will be your Leonidas.' And indeed so daring were they, that each seemed ready to emulate the Spartans of old. The master, perceiving their determined obstinacy, turned round without further remonstrance, and indignantly walked away.

Relieved from our terrors, we now became intoxicated with joy. The walls rang with repeated hurrahs! In the madness of enthusiasm some of the boys began to tear up the forms, throw the books about, break the slates, locks, and cupboards, and act so outrageously that the captain called them to order; not, however, before the master's desk and drawers had been broken open, and every plaything which had been taken from the scholars restored to its owner.

We now began to think of provisions. They were all placed on one table, and dealt out in rations by the captains of each company. In the mean time we held a council of war, as we called it, to determine on what was to be done.

At this critical moment a shout was set up that the parson and a constable were coming. Down went the pokers, and, as if conscience-stricken, we were all seized with consternation. The casement window was so shattered, that it could easily be entered by any resolute fellow. In the desperation of the moment we seized the desks, forms, and stools, to block it up; but our courage in some degree had evaporated, and we felt reluctant to act on the offensive. The old gentleman and his attendant deliberately inspected the windows and fastenings; but without making any attempt to enter, they retreated, for the purpose, as we presumed, of obtaining additional assistance. What was now to be done? The master appeared obdurate, and we had gone too far to recede. Some proposed to drill a hole in the window seat, fill it with gunpowder, and explode it, if any one offered to enter. Others thought we had better prepare to set fire to the school sooner than surrender unconditionally. But the majority advised what was perhaps the most prudent resolution, to wait for another attack, and if we saw no hopes of sustaining a longer defence, to make the best retreat we could.

The affair of the barring out had now become known, and persons began to assemble round the windows, calling out that the master was coming with assistants, and saying every thing to intimidate us. Many of us were completely jaded with the over-excitement we had experienced since the previous evening. The school was hot, close, and full of smoke. Some were longing for liberty and fresh air, and most of us were now of opinion that we had engaged in an affair which it was impossible to accomplish. In this state of mind we received another visit from our dreaded master. With his stick he commenced a more furious attack than before; and observing us less turbulent, he appeared determined to force his way, in spite of the barricades. The younger boys thought of nothing but flight and self-preservation, and the rush to the back windows became general. In the midst of this consternation, our captain exclaims, 'Let us not fly like cowards; if we must surrender, let the gates of the citadel be thrown open; the day is against us, but let us bravely face the enemy, and march out with the honours of war.' Some few had already escaped, but the rest immediately ranged themselves on each side the school, in two extended lines, with their weapons in hand. The door was thrown open—the master instantly entered, and passed between the two lines, denouncing vengeance on us all. But as he marched in, we marched out in military order; and giving three cheers, we dispersed into the neighbouring fields.

We shortly met again, and after a little consultation it was determined that none of the leaders should come to school until sent for, and a free pardon given.

The defection, however, was so general, that no car-

LIBRARY U.C. RIVERSIDE

poreal punishments took place. Many of the boys did not return till after the holidays, and several of the elder ones never entered the school again."

We chanced lately to notice the manner in which the Dublin College journals narrate the fact of such and such pupils having been trained in that seminary. The words are, that such a person, at such and such a time, *educatus erat sub ferula*; that is to say, "was educated under the birch." This emphatic record tells a tale applicable to all the teaching of bygone days, and, perhaps, the custom of barring out originated in, or is in part attributable to, the natural desire of shaking off the burden of this ferulean tyranny. Better days have come, and better still are coming, for education, for the which blessing let boys and birch be duly grateful.

LONG ABSTINENCE FROM FOOD AND AIR.

In the *Asiatic Journal* for February 1837, is an article, copied from the *Indian Journal of Medical and Physical Science* of Calcutta, to which it was communicated by Mr H. M. Twedell of Bancoorah, respecting a Hindoo who practises what may be considered as a kind of trade, by allowing himself for a remuneration to be buried, or otherwise shut up, apart from not only food, but air, for a month at a time. The document which immediately follows, constituting the principal part of this article, is a letter written by Lieut. A. H. Boileau, of the Engineers, first assistant in the Great Trigonometrical Survey. The gentlemen whose names are mentioned in the letter are Captain Trevelyan of the Bombay Artillery, and Cornet, now Lieutenant, Macnaghten, of the 5th Regiment Light Cavalry.

"I have just witnessed a singular circumstance, of which I had heard during our stay at this place, but said nothing about it before, the time for its accomplishment not being completed; this morning, however, the full month was over, and a man who had been buried all that time, on the bank of a tank near our camp, was dug out alive, in the presence of Esur Lal, one of the ministers of the Muharawal of Jaisulmer, on whose account this singular individual was voluntarily interred a month ago. He is a youngish man, about thirty years of age, and his native village is within five kos of Kurnaul; but he generally travels about the country to Ajmeer, Kotah, Endor, &c., and allows himself to be buried for weeks, or months, by any person who will pay him handsomely for the same. In the present instance, the rawul put this singular body in requisition, under the hope of obtaining an heir to his throne; and whether the remedy is efficacious or not, it certainly deserves to be known.

The man is said, by long practice, to have acquired the art of holding his breath, and stopping the interior opening of the nostrils with his tongue; he also abstains from solid food for some days previous to his interment, so that he may not be inconvenienced by the contents of his stomach, while put up in his narrow grave; and, moreover, he is sewed up in a bag of cloth, and the cell is lined with masonry, and floored with cloth, that the white ants and other insects may not easily be able to molest him. The place in which he was buried at Jaisulmer, is a small building about twelve feet by eight feet, built of stone; and in the floor was a hole about three feet long, two and a half feet wide, and the same depth, or perhaps a yard deep, in which he was placed in a sitting posture, sewed up in his shroud, with his feet turned inwards towards the stomach, and his hands also pointed inwards towards the chest. Two heavy slabs of stone, three or six feet long, several inches thick, and broad enough to cover the mouth of the grave, so that he could not escape, were then placed over him, and I believe a little earth was plastered over the whole, so as to make the surface of the grave smooth and compact. The door of the house was also built up, and people placed outside, that no tricks might be played, nor deception practised. At the expiration of a full month, that is to say, this morning, the walling up of the door was broken, and the buried man dug out of the grave; Trevelyan's moonshee only running there in time to see the ripping open of the bag in which the man had been enclosed. He was taken out in a perfectly senseless state, his eyes closed, his hands cramped and powerless, his stomach shrunk very much, and his teeth jammed so fast together, that they were forced to open his mouth with an iron instrument, to pour a little water down his throat. He gradually recovered his senses, and the use of his limbs, and, when we went to see him, was sitting up, supported by two men, and conversed with us in a low, gentle tone of voice, saying, 'that we might bury him again for a twelvemonth if we pleased.' He told Major Spiers, at Ajmeer, of his powers, and was laughed at as an impostor; but Cornet Macnaghten put his abstinence to the test at Pokhur, by suspending him for thirteen days, shut up in a wooden chest, which, he says, is better than being buried under ground, because the box, when hung from the ceiling, is open to inspection on all sides, and the white ants, &c. can be easier prevented from getting at his body, while he thus remains in a state of insensibility. His powers of abstinence must be wonderful to enable him to do without food for so long a time, nor does his hair grow during the time he remains buried.

I really believe that there is no imposture in the case, and that the whole proceeding is actually conducted in the way mentioned above."

Mr Twedell adds—"Some other information I obtained, in the course of conversation with Lieut. Boileau, and which I noted down. Lieut. Boileau was unacquainted with the man's name or caste; he believed that he had taken up the life of a fakeer—he understood that the man had been buried six or seven times, but whether for any period longer than a month, he knew not—he did not hear how the man discovered his powers, or when he commenced to practise them. Lieut. Boileau arrived at Jaisulmer after the interment, and saw the place, described in his letter, in which the man was buried. There was a guard of four or five chuprases, in the employ of the muharawal, as he understood, who were on this watch to prevent any interference or imposition. The process of burying, and of disintering, was conducted in the presence of Esur Lal, one of the ministers of the muharawal. The day fixed for the disinterment was known to Lieut. Boileau, but not the exact hour. Capt. Trevelyan's moonshee, who had set forth to give intelligence when operations were to be commenced, arrived only in time to see the people ripping open the cloth, or shroud, in which he had been enclosed. The moonshee immediately started off a man to inform his master and Lieut. Boileau, who were in their tents, at a distance of about three furlongs.

They waited a few seconds to apprise Lieut. Macneson, of the 14th Regiment N. I., British Agent for the navigation of the Indus, who was disinclined to accompany them, and repaired to the spot as quickly as possible. Perhaps a quarter of an hour had elapsed since the opening of the grave, before they arrived. The people had thrown a clean cloth over the man; two of them supported him; he presented an appearance of extreme emaciation and debility; but, weak as he was, his spirit was good, and his confidence in his powers unabated, as in answer to Lieut. Boileau's and Capt. Trevelyan's inquiries, he said, 'that we might bury him again for a twelvemonth if we pleased.' Lieut. Boileau examined, and measured with his walking-stick, the grave in the floor of the chamber in which the man had been buried, and also the two slabs of stone which had been used to cover the mouth of the grave. For seven or eight days preceding the burial, the man lived entirely upon milk, regulating the quantity so as to sustain life, whilst nothing remained to give employment to the excretory organs. In that state he was buried. He confesses to have great dread of the white ants. Several folds of cloth were spread on the bottom of the grave, to protect him from their attacks. On taking nourishment after his release, he is said to be in a state of anxiety, until he has ascertained that the powers of his stomach and intestines are not impaired. Lieut. Boileau saw nothing more of the man; he understood that he regained his strength, and was for some time in attendance at the durbar of the muharawal, in the hope of receiving his promised reward; and that, tired of waiting until the purse-strings of his patron were loosened, he had stolen a camel, and decamped.

Until further information is obtained, it might be thought precipitate to theorise on the probable means by which this strange being maintains the mastery over the functions of life. Yet there is one paragraph in Lieut. Boileau's letters, bearing on this point, on which some remarks are admissible. The paragraph alluded to runs thus:—

"The man is said, by long practice, to have acquired the art of holding his breath by shutting the mouth, and stopping the interior opening of the nostrils with his tongue." If this be the case, it is supposed that he exerts this power as soon as he finds himself comfortably settled in his grave, before the small quantity of vital air with which he is surrounded, is deteriorated. To force the tongue into the pharynx, and to retain it there until respiration is suspended, it is requisite that the jaws should be closely united. In Lieut. Boileau's letter, it is mentioned that his teeth were jammed so fast together, that they were forced to open his mouth with an iron instrument. Of the state of his tongue, nothing was remarked. It is now well known that the slaves in South America exert this power of the tongue to obstruct respiration, and occasion death."

We presume, from the respectable testimonials thus adduced, that there can be little doubt of the reality of the above occurrences. For their explanation science is, we believe, scarcely yet prepared, although instances of long abstinence from at least food are not new to the philosophical world.

LADY CORK'S RAFFLE.

Lady Cork, having one day taken into her head to have a "raffle," or lottery, for a charitable purpose, mentioned her idea to Lewis, who entered into the project with great willingness, and under his direction the whole affair was managed. As it was arranged that every body was to win something, Lewis took care that the prizes should be of a nature that would create the most ludicrous perplexity to their owners. Accordingly (for the raffle took place at a *soirée*) the assembled guests were parading the brilliantly-lighted drawing-rooms, burdened with the most out-of-the-way articles the eccentric hostess could procure, while the inventor of this novel kind of *plaisanterie* was silently enjoying the joke of their distress. Gentlemen were seen in every direction running about with tea-pots in their hands, or trays under their arms, endeavouring to find some sly corner in which to deposit their prizes; while young ladies were sinking beneath the weight, or the shame, of carrying a coal-scuttle or a flat iron. Guinea-pigs, birds in cages, punch-bowls, watchmen's rattles, and Dutch ovens, were perplexing their fortunate, or as, perhaps, they considered them-

selves, unfortunate proprietors; and Lady Cork's raffle was long remembered by those who were present, as a scene of laughter and confusion.—*Mont Lewis's Life and Correspondence.*

THE WAR OF THE LEAGUE.

[BY T. B. MACAULAY, ESQ. M.P.]

[Henry IV., on his accession to the French crown, was opposed by a large part of his subjects, under the Duke of Mayenne, with the assistance of Spain and Savoy. "In March 1590, he gained a decisive victory over that party at Yvry. Before the battle, he addressed his troops. 'My children, if you lose sight of your colours, rally to my white plume—you will always find it in the path to honour and glory.' His conduct was answerable to his promise. Nothing could resist his impetuous valour, and the leagueurs underwent a total and bloody defeat. In the midst of the rout, Henry followed, crying, 'Save the French!' and his clemency added a number of the enemies to his own army."—*Aiken's Biographical Dictionary.*]

Now glory to the Lord of Hosts, from whom all glories are!
And glory to our Sovereign Liege, King Henry of Navarre!
Now let there be the merry sound of music and of dance,
Through thy corn-fields green, and sunny vines, oh pleasant land of France!

And thou, Rochelle, our own Rochelle, proud city of the waters,
Again let rapture light the eyes of all thy mourning daughters—
As thou wert constant in our ills, be joyous in our joy.
For cold, and stiff, and still are they who wrought thy walls annoy.
Hurrah! hurrah! a single field hath turned the chance of war,
Hurrah! hurrah! for Ivry, and King Henry of Navarre.

Oh! how our hearts were beating, when, at the dawn of day,
We saw the army of the League drawn out in long array;
With all its priest-led citizens, and all its rebel peers,
And Appenzel's stout infantry, and Egmont's Flemish spears.
There rode the brood of false Lorraine, the curses of our land!
And dark Mayenne was in the midst, a truncheon in his hand;
And, as we look'd on them, we thought of Seine's empurpled flood,
And good Coligni's hoary hair all dabbled with his blood;
And we cried unto the living God, who rules the fate of war,
To fight for his own holy name, and Henry of Navarre.

The king is come to marshal us, in all his armour drest,
And he has bound a snow-white plume upon his gallant crest.
He look'd upon his people, and a tear was in his eye;
He look'd upon the traitors, and his glance was stern and high.
Right graciously he smiled on us, as rolled from wing to wing,
Down all our line, a deafening shout, "God save our Lord the King."

"And if my standard-bearer fall, as fall full well he may,—
For never saw I promise yet of such a bloody fray,—
Press where ye see my white plume shine, amidst the ranks of war,
And be your oriflamme, to-day, the helmet of Navarre."

Hurrah! the foes are moving! Hark to the mingled din,
Of fife, and steed, and trumpet, and drum, and roaring culverin!
The fiery Duke is pricking fast across Saint André's plain,
With all the hireling chivalry of Gelders and Almayne.
Now by the lips of those ye love, fair gentlemen of France,
Charge for the golden lilies now,—upon them with the lance!
A thousand spears are striking deep, a thousand spears in rest,
A thousand knights are pressing close behind the snow-white crest;

And in they burst, and on they rush'd, while, like a guiding star,
Amidst the thickest carnage blazed the helmet of Navarre.

Now, God be praised, the day is ours! Mayenne hath turn'd
his rein.

D'Aumale hath cried for quarter. The Flemish Count is slain.
Their ranks are breaking like thin clouds before a Biscay gale;
The field is heap'd with bleeding steeds, and flags, and cloven mail;

And then we thought on vengeance, and, all along our van,
"Remember St Bartholomew," was pass'd from man to man;
But out spake gentle Henry, "No Frenchman is my foe:
Down, down with every foreigner, but let your brethren go."
Oh! was there ever such a knight, in friendship or in war,
As our Sovereign Lord, King Henry, the soldier of Navarre!

Ho! maidens of Vienna! Ho! matrons of Lucerne!
Weep, weep, and rend your hair for those who never shall return.
Ho! Philip, send, for charity, thy Mexican pistoles,
That Antwerp monks may sing a mass for thy poor spearmen's souls!

Ho! gallant nobles of the League, look that your arms be bright!
Ho! burghers of Saint Genevieve, keep watch and ward to-night!
For our God hath crush'd the tyrant, our God hath raised the slave,

And mock'd the counsel of the wise and the valour of the brave.
Then glory to his holy name, from whom all glories are;
And glory to our Sovereign Lord, King Henry of Navarre.

THE NEWFOUNDLAND DOG.

Take another story of this noble beast, which I know to be founded in fact:—A vessel was driven on the beach of Lydd, in Kent. The surf was rolling furiously—eight poor fellows were crying for help, but not a boat could be got off to their assistance. At length a gentleman came on the beach, accompanied by his Newfoundland dog. He directed the attention of the animal to the vessel, and put a short stick into his mouth. The intelligent and courageous fellow at once understood his meaning, and sprang into the sea, and fought his way through the waves. He could not, however, get close enough to the vessel to deliver that with which he was charged; but the crew joyfully made fast a rope to another piece of wood, and threw it towards him. He saw the whole business in an instant; he dropped his own piece, and immediately seized that which had been cast to him, and then, with a degree of strength and determination almost incredible, he dragged it through the surf, and delivered it to his master. A line of communication was thus formed, and every man on board was rescued from a watery grave.—*Youatt's Humanity to Brutes.*

THE SCEPTICISM OF IGNORANCE.

THE readiness of the unlearned to give credit to any wonderful relation, and the tendency of knowledge to introduce doubt and unbelief into minds which formerly received every thing with implicit faith, are trite subjects of remark. We are less accustomed to consider a certain kind of scepticism which is appropriate to a condition of ignorance, or at most of semi-illumination, and which greater knowledge is apt to replace by belief. We often see this kind of scepticism exercised with regard to alleged truths in nature, of a kind which an unlearned mind does not readily apprehend. When such a truth, for instance, as the double motion of the earth, is presented to a thorough clown, he, struck by its inconsistency with his daily observations, and incapable of following the train of reasoning by which the thing is proved, rejects it at once. "My cottage," says he, "has stood, ever since I can remember, with its front to the south, and nothing will ever convince me that it moves." Accordingly, all endeavours to convince him are vain. His mind, employed since infancy upon a very limited field of observation, and accustomed to consider only the most obvious and commonplace things, is positively unfitted to receive the idea. It is like presenting a thirty-two pound shot to the muzzle of a fowling-piece. To make such a man fit for belief in the Copernican system, it would be necessary to work upon his mind for several years, in a process the reverse of that by which wire is made—presenting always a larger and a larger idea to it, till at length, perhaps, it might be expanded to the proper calibre for so large a conception.

The history of James Bruce and his Travels in Abyssinia supplies a remarkable illustration of this kind of scepticism. When the book came out in 1790, it was admired by a judicious few—and it is so far honourable to the understanding of George III., that he was of this number; but from the great mass one loud cry of contemptuous incredulity burst forth. The author stated that in Abyssinia fossil salt was used as money, a thing which had never before been heard of, and which therefore could not be true. He related how he had seen three soldiers, travelling with a cow, throw the animal down, and cut two slices of meat from her body, which they ate raw, closing up the wound at the same time with skewers—a statement in which there was too strong a combination of the ludicrous and horrible to allow of its being any thing but a fiction. He gave drawings of many plants of extraordinary appearance and properties, previously unknown in Britain—one, for instance, giving out milk when cut; likewise of many singular animals, particularly of a fly named *Zimb*, which had been known to destroy whole armies. These were evidently gross falsehoods. Accordingly, the book was scouted; the author even met with personal insult; and the last years of a life which had been devoted to the public service, were spent in morose solitude, instead of the enjoyment of those honours which his magnanimous hardihood and great sufferings, his industry, learning, and talent, had deserved. How has the question ultimately turned out? Several years after the grave had closed over the ill-used Bruce, Dr Clarke met at Cairo an Abyssinian clergyman, who, on being interrogated as to the above and many other points in the work, confirmed every thing which the author had stated, excepting a few trivial matters in which Bruce had evidently been mistaken, and which only served to show how entirely he had written in good faith. The investigation was conducted in circumstances of such caution, as to make deception impossible. Every

plant delineated in the book was named, as Bruce had named it, by the Abyssinian divine. "The result," says Dr Clarke, "left a conviction upon our minds not only of the general fidelity of that author, but that no other book of travels, published so long after the events took place which he has related, and exposed to a similar trial, would have met with equal testimony of its truth and accuracy."* If more proof of Bruce's fidelity had been wanting, it would have been supplied by Mr Henry Salt, who travelled in Abyssinia in 1809-10, and in whose work† every doubted statement of his illustrious predecessor is confirmed.

Now, what was it that caused the incredulity with which these particulars in Bruce's Travels were received? Obviously the low state of public intelligence at the time on topics connected with science. The critics of that day had never heard of a tree whose juice resembled milk: therefore they set down the Kol Quall as the fancy of an author anxious to amuse by exciting the feeling of wonder. They had never seen any insect more annoying than a gad-fly: consequently they could not believe in the existence of one whose sting could kill horses and cattle, and, when assembled in great hosts, destroy armies. They wanted steps by which to reach a conception of the possibility of such things; while to suppose an inclination on the part of the traveller to deceive, was so easy, that there was no avoiding it. It is an instructive circumstance with regard to this incredulity, that Mungo Park, in the account of his Travels in Africa, saw fit to suppress many remarkable adventures which had befallen him, from a sense that their marvellous nature would probably expose him to the same fate which had befallen Bruce.‡ If this principle were to be followed out, knowledge would be at a stand-still. No man would venture to announce any new discovery, or any new combination of moral circumstances, which in the least went beyond what was familiar before.

It is curious to see that the world, as it gets older, while constantly, from increased wisdom, detecting and rejecting proved errors, is at the same time supplying the place of those errors with truths which its ignorance once held as nought. The credit of many of the early historians and travellers has been steadily rising during the last fifty years. Herodotus, once scoffed at, is now very much in esteem, so many of his once disbelieved statements have latterly been proved true. This excellent old Greek relates that, about two hundred years before his own time—that is, between six and seven hundred before the commencement of our era—an Egyptian king sent some Phœnician mariners down the Red Sea, who, after an absence of two years, returned by the Straits of Gibraltar to Egypt. They must of course have sailed round the Cape of Good Hope, though he does not explicitly say so. He mentions that the sailors described themselves as sailing so far to the south, that at length they had the sun behind them—an allegation which does not seem credible to him. Yet this is just the best possible proof now-a-days that the sailors had passed to the south of the equatorial region. He says that it was found impossible to proceed far in Scythia, for the falling of immense quantities of feathers, which covered all the country—evidently a tale reported from some southern traveller who had never before seen snow. The fact is, that ancient writers were credulous; and when they trusted to reports which had come through many mouths, gathering new marvellousness as they

went along, they were generally wrong. But Sir Philip Sydney speaks of credulity as a misfortune peculiarly attending on *honesty*. These old gentlemen did not wish to deceive, and consequently all which came under their own observation is faithfully reported; and even when they wrote down hearsay wonders, they probably wrote them without a particle of further exaggeration. We may dismiss Herodotus, with a reference to the laborious work of Major Rennell for a full vindication of his good faith.* Dr Vincent, in his learned work on the Periplus of the Erythrean Sea, clears with equal success the reputation of three old writers, Megasthenes, Nearchus, and Onesicritus, who were once held as mere fabulists, but whose works are now found to contain "more truths than falsehoods, and many of whose imputed falsehoods are daily becoming truths, as our knowledge of the face of the earth is improved." Even the fable of the Argonautic expedition is found, by modern students of Indian geography, to have been not all fable. "Whatever difficulties may occur," says Dr Vincent, "in the return of the Argonauts, their passage to Colchis is consistent: it contains more real geography than has yet been discovered in any records of the Brahmins or the Zendevasta."

"Ferdinand Mendez Pinto was but a type of thee, thou liar of the first magnitude!"—so says some old English dramatist, quoted by Godwin on the front of his *St Leon*. Cervantes also has many a gibe at Ferdinand. He lived in the sixteenth century, and spent twenty-one years in travelling in Asia. Certainly his book is written in a manner calculated to excite suspicion, and does contain many fables. Yet some of the very things most hooted at in it have been since found true. For example, he speaks of beautiful gardens in the East, "in which the moon sheds such a kindly influence, that the roses bloom every month, instead of every summer." The monthly rose now grows all over southern and middle Europe. He speaks of "a wonderful beast with two legs, resembling a bird," and describes it as possessed of several other extraordinary peculiarities. His beast-bird was a subject of infinite mirth to his contemporaries; but, in very sober truth, he merely described the *casuari*. Let us not at this laugh too loud. The first describer of the duck-billed rat of Australia (*Ornithorynchus Paradoxus*) met, and it is not many years ago, with the same fate as Ferdinand Mendez Pinto.

About sixty years ago, the Portuguese who explored the interior of South America announced the extraordinary fact, that a natural connection exists between the great rivers Amazon and Orinoko. They spoke of a river Casiquiari, which, they said, extended like an artificial canal from a certain point on the Orinoko to the Rio Negro, a great tributary of the Amazon; so that two rivers, the mouths of which were at least a thousand miles apart, had a communion of waters in the upper part of their courses. The statements of the Portuguese on this subject were not believed, and systematic geographers showed with triumphant success that the thing was physically impossible. Nevertheless, it has been proved beyond all doubt that such a connection really exists. Humboldt sailed along it from the one river to the other, and gave a minute description of it to the public.† It has also been ascertained that similar curiosities exist elsewhere. A geologist, recollecting that hollows exist in the surface of the earth, of a different nature from

* The Geographical System of Herodotus, examined and explained, by a comparison with those of other ancient authors, and with modern geography. By James Rennell, F.R.S. 1800.
† A short account of this curious phenomenon is given in a subsequent part of the present number.

LIBRARY U.C. RIVERSIDE

those permeated by common rivers, and which he accounts for by supposing great floods to have worn them down in early ages, could readily imagine how such connections might exist between rivers flowing in the same direction. But the systematic geographers of fifty years ago knew nothing of these hollows. They only reflected on the ordinary valleys in which most rivers flow, and which certainly appear to preclude at least the likelihood of any such connections existing. They were therefore incredulous; whereas a little more knowledge might have given them confidence in the Portuguese discoverers, and induced them to receive respectfully a fact which subsequent observation has proved to be true. The history of science in all its departments is full of similar cases. That very science which has just been alluded to (Geology) is at this time undergoing the persecution which arises from the scepticism of ignorance. Its principal doctrines—the great age of the earth, and the existence of tribes of plants and animals many ages before the birth of the human race—are both met by every thing but open condemnation. Ignorant minds, and this description does not exclude many of the so-called educated classes, find it impossible to admit such things, while the enlightened see no difficulty in giving them at least a place as respectable and probable hypotheses.

The sciences enjoy very different degrees of good fortune with respect to probation. Some portions of nature appear to be almost beyond proof, so that possibly they may never take their place in established science. Others are capable of comparatively ready proof. Numbers and measurement are of the latter description; hence the early proficiency of mankind in these sciences. An Athenian, Sicilian, or Alexandrian philosopher of two thousand years ago, could go over nearly the whole bounds of these sciences by the mere exertion of his mind, with scarcely any aid from instruments. These sciences have accordingly forced their way. The merest simpleton could scarcely resist the conclusion that two and two make four, or that the two lesser angles of a right-angled triangle are equal to a right angle. The laws of matter and motion have also been too clearly proved to allow of a doubt remaining. Yet we cannot doubt that the ignorant would fain have disbelieved these things if they could. They show this by the extreme eagerness with which they resist and beat down any philosophical hypothesis, where the demonstration is not of the most direct kind. To this cause, we believe, we may in a great measure attribute the present almost exclusive attention to experimental science. Inquirers find no safety from the hosts of the ignorant and prejudiced, unless they can substantiate every announcement by such incontestible proofs that the howl which forms the natural salutation of every new truth is sure to be almost instantly put down. The least trespass from the experimental and numerical into the moral, is sure to be punished. The theory formed may be supported by many analogies and observations calculated to give something like conviction to the enlightened; but these will pass for mere folly with those who have no steps in their minds by which to attain to the same conclusions. If the least vagueness appear, or the slightest occasion be given to make error supposable, then instantly the inquirer is exclaimed against as a dreamer, and his theory snarled at and kicked out of all countenance. The great body of the ignorant seem to take a positive pleasure when they can catch a philosopher tripping, or see reason to suspect the soundness of any great discovery, though nothing can be more clear than that every new sentence added to the book of nature is a gain of a most important kind to the whole of mankind. Such conduct reminds one of the Irishman in the jest-book, who, when carried for a vagabond in the hod of his companion up a tall ladder set against a house, had hopes of being let fall about the third story. The position in which the sciences stand with the public at large, is altogether such as to recall to our mind a scene we once witnessed at a public spectacle. There was a railed space, jealously guarded, and into which the multitude were anxious to intrude. The guardians of the spot fought hard to exclude all who came; but, in spite of their efforts, a few hardy ragamuffins got in—very much scratched, and torn, and disordered, to be sure, but still there they were. "Very well," said the superintendent, "you fellows may stay, but not one of these (pointing to a number of decent applicants) shall be admitted." The hardy mechanical sciences have thus fought their way into the place of honour, while the moral sciences, timid, modest, but infinitely more valuable, shrink back from the threatening constable's baton of Ignorant Incredulity, and are trodden in the kennel.

Far be from us all intention, by these remarks, to insinuate the least censure of a philosophical caution in granting belief. We are only anxious, while the evils to the cause of truth from rashly admitted propositions are so prominently kept in view, to draw some attention on the other hand to the injury which the same great cause appears to us, in many instances, to suffer from propositions being too rashly denied and thrown aside. Times without number, in ordinary society, we have seen facts rejected through suspiciousness, or prejudice, or in a mere spirit of wanton scepticism, while we chanced to be assured of their truth; and we could not help lamenting that these facts went for nought, almost as much as we should have done for the admission of others upon manifestly insufficient

grounds. The world is thus daily and hourly losing the benefits of a vast amount of experience and observation, which, if received upon a fair authentication, could not fail to be of the greatest service to it. So liable are we to suspicion, that no fact whatever, if of an extraordinary nature, has the least value after passing through two mouths, or if it have happened at a considerable distance. Obscurity and doubt then rest upon it, and it is consigned to the limbo of all useless things. The scepticism invariably increases, in proportion as the alleged fact is remote from the common trains of ideas, or irrelative to the ordinary motives of action, of him to whom it is communicated. The sordid can believe nothing generous; the perverted and prejudiced mind can admit no straightforward truth. There is in all this, we seriously believe, a presumption of such an amount of insincerity and bad faith in all narrators, as, if it existed, would be totally incompatible with our most valued social relations. The ingenious Laputan philosopher who endeavoured to extract sunbeams from cucumbers, might very properly, we think, have had another task assigned to him—to store up and extract the good from the millions of truths every day coming into existence, but which, as things stand, become instant lumber, through the uncalculated-for suspiciousness and the prejudices of mankind.

THE RECLUSE LADIES OF LLANGOLLEN.

[Many imperfect accounts of these heroines have been published: they have been the subject of innumerable newspaper and magazine paragraphs, and are described by no small number of tourists. It has, nevertheless, occurred to us that a complete account of them, tracing their story from the beginning to its close, and affecting no kind of sentimentalism, might be worthy of a place in these pages. Such is the following account, which has been compiled from the most authentic sources, and may be, we believe, in all its parts, fully relied on.]

ELEANOR BUTLER was the third and youngest daughter of Walter Butler, Esq., by Eleanor, daughter of Nicholas Morris, Esq. of the Court, in Dublin county. This branch of the Butler family being lineally descended from the noble house of Ormonde, the honours of which were then dormant, John, only son of the Walter Butler now mentioned, claimed and obtained, in 1791, his ancestral earldom of Ormonde, on which occasion Eleanor and the two other sisters of the new peer took the rank of earl's daughters. John Earl of Ormonde was the father of the present marquis, who consequently stands in the relation of nephew to one of the subjects of this memoir. With this account of the family of Lady Eleanor Butler, as we shall call her, to avoid confusion, from beginning to end of the following narrative, we have to connect that of Miss Sarah Ponsonby, who was the daughter of Chambre Brabazon Ponsonby, nephew to the first Earl of Besborough. Miss Ponsonby's birth took place in 1756, being two or three years later than that of Lady Eleanor Butler.

On reaching womanhood, these two young ladies formed a strong mutual attachment. Connected so intimately with families both wealthy and distinguished, and endowed by nature with many agreeable personal qualities, it may be supposed that opportunities for favourable settlements in life would readily fall in their way; and this, indeed, appears to have been the case, as Lady Eleanor is said to have declined no less than five offers of marriage. It has been stated, however, that the lady's conduct in this respect did not arise from any objections to matrimony in general, but from her affections having been crossed in the only direction which they had ever voluntarily taken. Whatever may have been the cause of Lady Eleanor's aversion to the nuptial engagement, her feelings were fully participated by her friend Miss Ponsonby. Residing chiefly in the country, at the seat of the Butler family, the young ladies shunned all society, and nursed in retirement the peculiarities of taste which had sprung up in their minds. At length they resolved to fly to some sequestered spot, where they might live entirely for each other, unheard of by the world. But in putting this romantic resolve into execution, they did not use sufficient precautions, and were brought back by their friends, who separated them for a time, being extremely anxious for their proper establishment in life, and justly conceiving that the presence of the one only encouraged the other in those sentiments which it was desirable to eradicate. The parted friends, nevertheless, soon found means to correspond, and to renew their schemes of elopement. It was in the year 1778 that they finally effected their purpose. They made their way together to a seaport, where they found a Welsh trader just about to set sail, and on board of which they embarked. To prevent their course being readily traced, and also, we may suppose, to give at least a show of protection to the fugitives,

the example of Celia and Rosalind in *As You Like It* was followed on this occasion. And we can conceive Miss Ponsonby to have used Rosalind's very words to her friend—

"Were it not better,
Because that I am more than common tall,
That I did suit me all points like a man?"

Accordingly, to use the words of Sir Walter Scott, "Lady Eleanor arrived (in Wales) in her natural aspect of a pretty girl, while Miss Ponsonby condescended to accompany her in the garb of a smart footman with buckskin breeches." This selection of attire by Miss Ponsonby was the cause of considerable talking, and many "years elapsed (to continue Sir Walter's words), ere full justice was done to the character of their romance." The presence of a third person in the party ought in some measure to have prevented such invidious reflections. This was a faithful servant, Mary Carryl, a person more advanced in life than the ladies, whom she accompanied in their flight, and with whom she remained till her death.

North Wales was the region where Lady Eleanor, with her seeming footman and female attendant, was landed. Retirement being the object of the fugitives, they crossed the romantic mountains of North Wales, looking every where for some pretty little solitude, such as their fancy had conjured up to them as a fitting place of abode. But the country, particularly in its secluded parts, was desolate and dreary, and the ladies were almost in despair of accomplishing their object. They traversed Wales to its very border, and even when they reached Llangollen in Denbighshire, its dells and g'ns presented an aspect not more favourable than the districts already passed. "But while leaving this last hope with heavy hearts," said Miss Ponsonby to a visitor, long afterwards, "we turned round to take a last look at this land of our promise; the setting sun was then shining on the romantic ruins of Dinas Bran, and its sloping beams gave to the wooded sides of the glen so lovely an aspect, that it seemed to invite our return; so we determined to go back and again search for a residence in the shadow of the mountains." The only shelter they could find was in a mean cot on the naked side of a hill, and this same tenement, humble as it was, they purchased from its inmates next morning. They appear, also, to have become tenants of some two and a half acres of ground around their habitation.

The place of their retreat remained for some years unknown to their friends. At first Lady Eleanor and Miss Ponsonby were subjected to severe privations, the more severe because endured by beings whose nurture had been delicate and refined. Their garden and cow supplied them with food, and they themselves, aided by their faithful servant, performed the toil requisite to procure even these necessities. They soon made great improvements on their place of abode, but they were grievously alarmed, after they had staid a considerable time in the vale, by a notification from the proprietor of the ground that they must remove. While very disconsolate at this information, the "Ladies of the Vale," as they were called in the neighbourhood, were further grieved by the abrupt disappearance of Mary Carryl. They supposed she had become wearied at length of solitude, and had gone to her friends; but Mary returned after a few days' absence, and, laying a paper on the table, exclaimed, "Now, my dear children, you are settled for life." She had visited the proprietor in London, and, by means of all her earnings in service, had procured a lease of the cottage and grounds around it.* About the same time, the circumstances of the ladies were bettered in other respects. Their friends had discovered their retreat, and, perceiving their determination to be unchangeable, made fitting pecuniary provisions for their future comfort in the solitude they had chosen. It is probable, indeed, that the ladies could have claimed independent means, more or less, in their own right. However this may be, Lady Eleanor and Miss Ponsonby began to ornament their cot and its grounds in a most tasteful style, till, by degrees, they had made the place the fairy palace which Miss Seward describes it to have been when she visited the recluses. Reduces they were, it should be noticed, in the strictest sense of the term, for the greater part of twenty years. Though the romantic story of their friendship and seclusion spread through the kingdom, and though people of the highest rank endeavoured to gain an entrance to the paradise they had created, and to behold its inmates, Lady Eleanor and Miss Ponsonby remained firm to their purpose, and received no stranger within their gates. They first broke through their rules in favour of some distinguished foreigners, Madame Genlis being among the earliest admitted visitors. As time ran on, they became less reserved, and at length received visits without scruple. Miss Seward, who visited Llangollen ere time had obscured the personal graces of its inmates, thus speaks of them and their dwelling. "You

* This anecdote is given on the authority of a visitor to Llangollen, who professes to have received his information from the ladies themselves. The same visitor states that Mary Carryl did not attend the ladies in their flight, but sought and found them afterwards. This, however, appears to have been a mistake.

will expect that I should say something of the enchantresses themselves. Lady Eleanor is of middle height, and somewhat beyond the *enbonpoint* as to plumpness; her face round and fair, with the glow of luxuriant health. She has not fine features, but they are agreeable; enthusiasm in her eye, hilarity and benevolence in her smile. Exhaustless is her fund of historic and traditional knowledge, and of every thing passing in the present eventful period. She expresses all she feels with an ingenuous ardour, at which the cold-spirited beings stare. I am informed that both these ladies read and speak most of the modern languages. Of the Italian poets, especially of Dante, they are warm admirers.

Miss Ponsonby, somewhat taller than her friend, is neither slender nor otherwise, but very graceful. Easy, elegant, yet pensive, is her address and manner.

* Her voice, like lover's watched, is kind and low.*

A face rather long than round, a complexion clear but without bloom, with a countenance which, from its soft melancholy, has a peculiar interest. If her features are not beautiful, they are very sweet and feminine. Though the pensive spirit within permits not her lovely dimples to give mirth to her smile, they increase its sweetness, and, consequently, her power of engaging the affections. We see, through her veil of shading reserve, that all the talents and accomplishments which enrich the mind of Lady Eleanor, exist, with equal powers, in this her charming friend.* The dress of the ladies was always odd, to say the least of it. To the end of their days, as will be noticed afterwards, they wore a sort of half-masculine attire, consisting of men's hats, riding-habits, and other such articles.

Miss Seward describes Plasnewydd Cottage, the name given to the hermitage, as a "retreat which breathes all the witchery of genius, taste, and sentiment. You remember Mr Hayley's poetic compliment to the sweet miniature-painter, Miers :

* His magic pencil, in its narrow space,
Pours the full portion of uninjured nature.*

So may it be said of the talents and exertion which converted a cottage, in two acres and a half of turnip ground, to a fairy palace, amid the bowers of Calypso. It consists of four small apartments; the exquisite cleanness of the kitchen, its utensils, and its auxiliary offices, vieing with the lightsome elegance of the gay little dining-room, as that contrasts the gloomy yet superior grace of the library, into which it opens. This room is fitted up in the Gothic style, the door and windows being of that form, and the window of painted glass 'shedding a dim religious light.' Candles are seldom admitted into this apartment. The ingenious friends have invented a kind of prismatic lantern, which occupies the whole elliptic arch of the Gothic door. This lantern is of cut glass, variously coloured, enclosing two lamps with their reflectors. The light it imparts resembles that of a volcano, sanguine and solemn. It is assisted by two glow-worm lamps, that, in little marble reservoirs, stand on the opposite chimney-piece, and these supply the place of the here always chafed daylight, when the dusk of evening sables, or when night wholly involves, the thrice lovely solitude." After describing the contents of the library, consisting of finely bound editions of all the best authors, foreign and domestic, Miss Seward continues:—"The kitchen-garden is neatness itself. Neither there, nor in the whole precincts, can a single weed be discovered. The fruit-trees are of the rarest and finest sort, and luxuriant in their produce; the garden-house and its implements are arranged in the exactest order." The dairy is pictured as equally perfect, and we have the following account of the whole circumjacent grounds. "The way shaded gravel-walk which encircles this Elysium, is enriched with curious shrubs and flowers. It is nothing in extent, and every thing in grace and beauty, and in variety of foliage; its gravel smooth as marble. In one part of it we turn upon a small knoll, which overhangs a deep hollow glen. In its tangled bottom, a frothing brook leaps and clamours over the rough stones in its channel. A large spreading beech canopies the knoll, and a semi-lunar seat, beneath its boughs, admits four people. Cypress, yew, laurel, and lilac, growing luxuriantly in the shrubberies, complete the embowered and tranquil beauty of the scene."

The friendship of these remarkable ladies for each other, which had led them to despise and to sacrifice all the allurements of refined society, and had drawn them, in the bloom of youth, into solitude, never suffered an hour's diminution in the course of their lives. But they had still feelings and affections to spare for others of their fellow-creatures. In the neighbouring hamlet, and in all the cots around Llangollen, the "Ladies of the Vale" were almost idolised for their kindness and attention in ministering to the wants of the poor. Their extraordinary career, therefore, was no useless one. In the district which they adorned, their memory will long be held in reverence. It is not unworthy of notice that one of our recluses was a Catholic, and the other a Protestant. Lady Eleanor Butler had her little chapel, and her Madonna to kneel before, while her friend, after their rigid seclusion had been somewhat relaxed, was visited by the parish clergyman, and attended his church. The friendship of the pair, however, was proof even against this potent cause of dissension—potent, above all, in the land where these ladies were born and educated.

Time wrought its usual changes on the ladies of

Llangollen, both mentally and physically. As their early charms of person faded gradually away, much of their original enthusiasm of character, also, wore off, and, by conversing more and more freely with visitors, they became more like beings of the ordinary world than they once were, and took more interest in its every-day proceedings. From an early period of their seclusion, they had never ceased to keep up, by means of newspapers and books, their knowledge of passing events, but, latterly, they accustomed themselves much more to think of little sublunary matters. The following letter of Sir Walter Scott, written in August 1823, during a tour in Wales, gives rather an unromantic view of them; but as the writer professedly desired to make his family merry by the epistle, which his biographer justly calls a gossiping one, we must make allowance for a little exaggeration. "At Llangollen," says Scott, "your papa was waylaid by the celebrated 'Ladies.' We proceeded up the hill, and found every thing about them and their habitation odd and extravagant beyond report. Imagine two women, one apparently seventy, the other sixty-five, dressed in heavy blue riding-habits, enormous shoes, and men's hats, with their petticoats so tucked up, that at the first glance of them, fussing and tottering about their porch in all the agony of expectation, we took them for a couple of hazy or crazy old sailors. On nearer inspection, they both wear a world of brooches, rings, &c., and Lady Eleanor positively orders—several stars and crosses, and a red ribbon, exactly like a K.C.B. To crown all, they have crop heads, shaggy, rough, bushy, and as white as snow, the one with age alone, the other assisted by a sprinkling of powder. The elder lady is almost blind, and every way much decayed; the other, the co-dervant groom, is in good preservation. But who could paint the prints, the dogs, the cats, the miniatures, the cram of cabinets, clocks, glass-cases, books, bijouterie, dragon-china, nodding mandarins, and whirligigs of every shape and hue—the whole house outside and in (for we must see every thing to the dressing-closets) covered with carved oak, very rich and fine some of it—and the illustrated copies of Sir Walter's poems, and the joking sinpering compliments about Waverley, and the anxiety to know who MacIvor really was, and the absolute devouring of the poor Unknown, who had to carry off, besides all the rest, one small bit of literal butter dug up in a Milesian stone jar lately from the bottom of some Irish bog. Great romance—that is, absurd innocence of character—one must have looked for; but it was confounding to find this mixed up with such eager curiosity and enormous knowledge of the tattle and scandal of the world they had so long left. Their tables were piled with newspapers from every corner of the kingdom, and they seemed to have the deaths and marriages of the antipodes at their finger-ends. Their albums and autographs, from Louis XVIII. and George IV. down to magazine-poets and quack-doctors, are a perfect museum. I shall never see the spirit of blue-stockings again in such perfect incarnation. Peveril (a nickname for himself) won't get over their final kissing for a week. Yet it is too bad to laugh at these good old girls; they have long been the guardian angels of the village, and are worshipped by man, woman, and child about them."

There is a very wise Scriptural saying about ocular beams and notes, which is somewhat applicable here. If any body should have refrained from laughing at the establishment of the Llangollen ladies on account of the dogs, cats, cram of cabinets, clocks, bijouterie, and whirligigs of every kind which it contained, or on account of the estimation in which the excavated pot of butter was held, all will allow that honest Sir Walter ought to have been that indulgent personage, seeing that his own house was notoriously chokefull of similar knick-knackeries, and seeing, also, that on much less interesting relics of antiquity than pots of Milesian butter, he himself expended large sums annually for the better part of his life—a fact, by the bye, which seems never to have been taken into consideration amid all the calculations respecting his expenditure which have been recently laid before the world. But Sir Walter did not seriously desire to "lichtlie" the Llangollen ladies, and therefore we will not go on arguing as if he did. We were and are desirous, however, that the two remarkable personages who have now been brought before the reader, should leave the stage in possession of his respect, and we cannot effect this object better than by describing the conduct of Miss Ponsonby to Lady Eleanor, when the sight of the latter failed utterly. "It was now (says a visitor of this period) that the friend of her youth and age, whose faculties God had spared, exerted them for the use of both, and performed all the offices of love and duty for her blind companion. She watched over her with maternal tenderness, read for her, worked for her, and did every thing which would not be so grateful from any other's service. When I paid my visit, I found Miss Ponsonby leading her friend round the lawn, as a fond mother leads a child; and it would have stopped an angel, on his errand of mercy, to have seen them walking hand in hand through the shrubs and trees, while the friend who could see was explaining to the friend who could not see, all the budding beauties of the spring, in which they were both wont to take such pure delight."

Mary Carryl lived to an advanced age with the friends, but she was the first of the household who departed. She was laid in Llangollen churchyard, and

the ladies erected near her a pyramidal monument with three sides, on one of which an inscription was placed descriptive of her merits. The other two sides of the same monument were intended for the record of their own names, and the intention was in due time fulfilled. Lady Eleanor Butler died on the 2d of June 1829, at the age of seventy-six or seventy-seven. Her friend Miss Ponsonby survived her but a short period. On the 8th of December 1831, this lady also died, and the records on the triangular tombstone were completed.

Few remarks need be made on the history of the Recluses of Llangollen. Their early choice of solitude, and preference of one another's society to that of the world, might have been ascribed to the common enthusiasm and romanticism of youth, but for the steadiness with which they adhered to their purpose in spite of all obstacles, and the enduring nature of their friendship—circumstances which showed unusual strength of character, and proved their resolves to be of a different kind from the many fleeting ones of a similar order, formed by other romantic pairs at the same period of life. With many oddities of temperament, Lady Eleanor Butler and Miss Ponsonby were assuredly very much superior, both in intellect and feeling, to the ordinary herd of mortals.

A FEW STATISTICS OF CRIME IN ENGLAND.

CRIME IN TOWNS AND RURAL DISTRICTS.

THE "First Report of the Commissioners appointed to inquire as to the best means of establishing an efficient Constabulary Force in the Counties of England and Wales," discloses a variety of remarkable facts concerning the lawless habits and barbarism of certain sections of the urban, rural, and sea-coast population of the country. It appears from the evidence produced that there are 100,000 commitments annually to the jails, of the able-bodied population, for criminal offences—that there are at all times from 11,000 to 20,000 persons in the criminal jails—and at least 40,000 men, women, and children, who are habitual vagrants, and live entirely by public depredation; this is exclusive of several thousands of common thieves in London. In every town throughout the kingdom there are houses for the harbouring of vagrants, and for purchasing their stolen property. Chester has from 150 to 200 of these houses, and Chelmsford, which is likewise a great centering point for tramps, has also a considerable number.

Thieving united with begging, forms, we are told, one great criminal profession, the members of which constantly migrate from place to place, to escape detection and seizure; those towns and parts of the country destitute of any regular police force being their principal resort. The more clever of the order are well acquainted with all the chief towns, fairs, and races in the kingdom, and make periodical rounds in quest of plunder, with as much regularity as a mercantile traveller pursues his ordinary business. They also, in these excursions, assume all sorts of disguises. One day they are almost destitute of clothing, shivering in the wind as poor shipwrecked sailors, their trousers daubed with a "ha'porth of tar;" the next they are dressed in finery as members of the swell mob; and the next again, perhaps, to escape detection, they are in a long coat with a basket over their arm, dealing in small wares and goods purchased from a depot of shop-lifted articles. Thus, town after town is visited, and an immense deal of property purloined. Beginning at Wrexham fair in March, they perform a circuit of crime, going to races, fairs, and wakes, in regular order through the midland counties, until Sheffield fair in November, which usually closes the "beat" for the season.

Both from the confessions of individuals who have run their career of crime, and from other sources of information, it is learned that the plunder realised in a course of habitual depredation averages from 10s. to £5 weekly for each person; the greater part make about £2 weekly each, it being only boys or beginners who pilfer on a small scale that realise so little as 10s. Not a single instance, however, can be produced of one of these plunderers being permanently benefited by his gains—all is spent in the vilest manner as soon as earned. Some, by a lucky chance, and the comparative want of an efficient constabulary, run a course of ten or twelve years, but by far the greater proportion finish their career in five years. At the end of that period they are either hanged or banished, neither punishment, be it remarked, being of the smallest efficacy in intimidating or suppressing the great fraternity of criminals spread over the country. During the currency of the five years of lawless depredation, there are few who are not from thirty to forty times

in the hands of justice; but this only increases their ingenuity in their nefarious profession, for at each confinement in jail they come in contact with companions skilled in criminal practices, and go forth to the world with a higher qualification for wickedness.

Nothing is so hateful to the members of the criminal profession as a regular police force. The metropolis, which used to contain some thirty or forty thousand thieves, has been pretty well cleared of the more formidable members of this mighty gang, who now go upon the regular beats in the provinces. In consequence, also, of the consolidation of an effective police force in Liverpool, one thousand notorious thieves have left that city, but to the serious injury of the surrounding towns and villages. It appears, from a report drawn up by a sub-committee of the municipal council of Liverpool in 1836 (which we presume to have been previous to the above expatriation of the thousand thieves), that the estimated loss to the public annually in that town and port alone, from lawless plundering of one kind and another, was £734,240.

Besides the losses sustained from the casual depredations of the vagrant tribes of thieves, the country parts of England suffer in an incalculable degree from the pilferings of a section of the settled population. The crimes committed by residents are very various, from the stealing of a turnip to that of a sheep or a horse. Sheep-stealing in certain districts, Essex for example, is very prevalent. The animal is slaughtered in the night; the skin, head, and entrails, being hidden or left in some sequestered spot; scarcely a week passes but a theft of this kind occurs. The petty robberies are such as stealing wood, lopping off branches of trees, cutting up hurdles, gates, &c., carrying off turnips, poultry, portions of ricks, bee-hives with their honey, fruit when in season, and any loose article worth taking. A gentleman in Essex, in his examination for evidence, states that, since 1835, more than twenty sheep have been separately slaughtered and stolen within two miles of his house, without detection. In the parish of Corley, near Clebury Mortimer, forty sheep have been killed and stolen in one year. Horse and cattle stealing also forms a heavy item in the catalogue of these rural depredations, though these crimes should probably be charged more against the nomadic tribes, than the settled peasantry. The losses incurred by the abstraction of agricultural produce are altogether incalculable, even in limited districts. From the evidence laid before the commissioners by farmers and others, it would almost appear that the system of plundering was universal, that no man's property was safe. The loss, it is mentioned, is more frequently sustained by poor labourers or small farmers, than by the wealthy landowners, whose estates are generally under better protection. In the parish of Hinton, near Bath, the allotment system was tried, and thrived amazingly, until the people began to store their little produce. Then commenced a general system of nocturnal thieving. Potato-pits were broken open and plundered, quantities of onions were carried off, and out of the small stacks of grain, loads were from time to time abstracted. As the poor men who owned the articles had to work during the day, they could not sit up during the night to protect their property. It is not mentioned what was the ultimate effect of these infamous practices.

The following portions of the examination of Mr Richard Gregory, a farmer, who farms between 400 and 500 acres of land in the parish of East and West Ham, in the county of Essex, is descriptive of the depredations to which farmers in the neighbourhood of the larger towns are subjected:—

"Are you acquainted with the depredations to which farmers and holders of agricultural property are exposed, and their want of appropriate protection?—I am; the person I succeeded had been very much plundered by his servants. The men engaged upon the farm premises would get up between twelve and four o'clock in the morning, while the farmer was a-bed, and help themselves to every kind of produce. Most of the plunder was regularly disposed of by the carters at the different watering-houses on their way to the London markets. There, almost as a matter of course, they sold their horses' corn, and much that should have been part and parcel of the produce they delivered to the different salesmen. The general plan was for them to put the things into cellars, or boxes left open on purpose at these houses, and as they returned they were paid for what they had left by the ostlers at the side of the road.

That was the state of things when you took the farm; do you know whether such practices prevail at the present time?—To a great extent. Upon several occasions in going backwards and forwards, as I do daily, I have detected farmers' men plundering their masters in these ways, and have had them taken into custody and prosecuted. This loss, too, by robbery, is not the worst of it. When they return from market and stop to receive the money, they stop to drink too, and their masters' horses stand of course exposed to the weather, and exhausted, with only a drink of water instead of their proper food, which very frequently causes their death. Farmers consider, perhaps, that it is from their horses getting cold on the way, but never think of any further causes. When I entered on the farm, I said to my men, 'Never take a bit of corn to London for the horses; and if I catch any

of you stopping at the public-houses, I will discharge you.' I gave my carters, perhaps, better wages than other people, and I hardly ever lose my horses. They have no victuals out of stable. 'I do not mind,' I said to the men, 'giving you better wages, but you shall not stop by the road-side to kill my horses.' The first week I caught one stopping, and I discharged him. My neighbours all said it was impossible to prevent the practice; but, by perseverance, I succeeded, and my men never think of stopping; as I tell them, if they do not rob me, they rob their wives and families; so one way or another they must be thieves if they use these road-side public-houses. Why, the ostlers of these houses give from 5s. and 10s., up even to 20s. or 30s. a-week, for their places.

Have you ascertained that fact? (This fact was corroborated by two other witnesses).—Yes; and it was ascertained also at the Old Bailey. When I had suspicion of any one, I have gone to these road-side cupboards for myself. Once I saw a man put a truss of hay into a place with 'Dry skittle ground' written over. I got a policeman, took him with me to the public-house, and there we found in the same spot fifteen or twenty of the different farm baits, two trusses of hay, a truss of straw, and some potatoes and mangel-wurzel. I had the ostler taken to the Lambeth Street police-office to answer for the contents of his cupboard, the 'dry skittle ground.' On another occasion I saw a fellow take a truss of hay, and strike it down the cellar of another house. The man at another house has a yard where the carts all draw up. As a proof of the evil of the road-side public-houses, I may mention that many waggoners used to stop at the King's Arms at B—. Complaint was made of the obstruction to the trustees of the road, of whom I am one. The parties were summoned and convicted, and the owner of the public-house paid their fines. This is proof that he was interested in the depredations on the unfortunate owners of the waggons, otherwise he could never have afforded it. I know many other instances. For other sorts of depredations I am obliged to keep watchmen whenever I have any thing valuable in the ground. It is not so bad now as it was, because of the horse-patrol. Still I must have watchmen, sometimes two, sometimes three.

And it pays you to keep these watchmen?—Certainly; for £5 or £6 or £10 worth of produce might be carried off in four or five bags.

It is stated to us that from the loose mode in which farmers keep their accounts, they are seldom able to ascertain the amount of their losses in this way?—Yes. There is another mode of plunder I may call your attention to, by a description of the person called a jobber. He is a man who keeps his own one-horse car. He has been an old carter, maybe one of your own servants, and is associated with all your work-people. He comes to the farmer, if possible to one that likes shooting and hunting and sleeping, and such like, more than his business, and offers more for his produce at the barn-door than he can get for it when he takes it himself to any market. But the jobber gives this, and beer to the barn man besides; and his truss of straw, instead of 36 lbs., weighs 50 lbs. A farmer told me the other day of a great bargain he had made; he got from such a one 28s. a ton for his mangel-wurzel. 'Why, the fellow sells it again himself at 25s.; there must be something wrong somewhere.' The farmer took the hint, and investigated the case. A day or two after, the man came again for half a ton. He had it as usual, but he was followed, and on examination we found the half ton to be 22 hundred instead of 10! These are the ways that farmers get ruined, and do not know how it comes about.

Have you known instances of farmers being ruined, whose ruin you would attribute to the prevalence of these practices?—The young man I succeeded was one, and the same has been the case with many of the first farmers in the county of Essex.

Besides these depredations you have described, have you experienced much annoyance from vagrants and such casual plunderers?—I have one field adjoining a footpath, from which I lost half an acre of potatoes in the course of a week by children. They scratched them up with their hands, their parents standing a little way off ready to carry them home. I had a very valuable piece of rare cabbage plants, about fifty acres; an old vagrant who had got his living for thirty years by plundering farmers, could not forego so tempting an opportunity. I had him apprehended and taken to Lambeth Street office. The magistrates gave him one month's imprisonment, and, on inquiry of the jailor, I learned that he had been there no less than twenty-six times before. He had not been out of jail two days before I had him in my fields again stealing my cabbage plants, which he sold to my neighbours before my face at 18d. a-hundred. He was a second time detected and convicted. He had not been out of prison a week before we caught him again. Seeing that punishment had no effect, I this time suggested to the magistrates to try a lenient course. The old man said, 'If you give me the book there, I will swear never to rob you any more as long as I live.' Well, he was forgiven and set free, and the very next morning or the morning after I found him at his old tricks the same as ever. This time I tried another plan. As the law administered by others was of no avail, I took the law into my own hands. I inflicted corporal punishment, and it had the desired effect. I took a stick and thrashed him most soundly, and he has never troubled my fields since. My neighbours are not so fortunate.

If we have understood you, then, by your three watchmen, and your constant enforcement of the law, you keep off a considerable amount of plunder?—Yes.

Are your neighbours who do not use the same means plundered as you expect you would be if you did not use them?—Yes, and considerably more; for, being many of them timid people, they encourage depredators. If they catch a thief, they do not punish him, being afraid of having their houses set fire to, or their cattle destroyed. The other night a man near me, named Farrel, had been thrashing his wheat over night, and in the morning all was gone. The next farmer had one of his horses stabbed because he had accused a man of stealing a pig he had

lost. A Mr Choze had a calf's throat cut. I persuaded him to prosecute, and the court at the Old Bailey gave the offender fifteen years' transportation. It was quite a deliverance for us all. Another farmer had just before had his farm-yard set fire to by the same fellow. Every body had been afraid of him, and afraid to punish him.

In all these cases of depredations upon farmers, the plunder must be considerable to bring any thing worth while to the parties, as the produce must be sold at so much less than its real value?—It is great; and the great source of the evil is the beer-shop. You are sure to find the robberies concocted at beer-shops. When I took my farm, there was no beer-shop; one was set up, and the difference seen in the working people before and after was such as no one would conceive. I had hardly lost any thing before that by my own people's dishonesty, and now I was obliged to watch them every way. They would take my fowls, and go there and have them cooked, right opposite my farm-yard. They would cut the hearts out of the cabbages for the same purpose. I once went with a patrol and took one half boiling out of the pot. I took the man and the cabbage to Lambeth Street, and then it was found out that he and his brother had been plundering in a larger way; and they were both transported.*

In a subsequent paper, we shall lay before the reader some remarkable facts connected with the lawless habits of the *wreckers* on the coast of England.

THE FIRST LOCOMOTIVE.*

BY ONE WHO SAW IT.

It is now very generally conceded, that of all the inventions of man, none holds any comparison with the steam-boat. The mind can scarcely combine a calculation which may measure its importance. Some vague estimate may indeed be formed of it, by imagining what would be the state and condition of the world at the present day, were there no steam-boats; were we still to find ourselves on board sloops, making an average passage of a week to Albany, exposed to all the disasters of flaws from the "downcomer," and discomfiture of close cabins; or ascending the Mississippi in a keel-boat, pushed every inch of the way against its mighty current, by long poles, at the rate of "fourteen miles in sixteen hours."

It is now just thirty years since the first steam-boat ascended the Hudson, being the first practical application of a steam-engine to water conveyance. Then, no other river had ever seen a steam-boat; and now, what river, capable of any kind of navigation, has not been beppaddled with them! It is not my purpose to enter the list of disputants, lately sprung up, striving to prove that the immortal FULTON was not the first successful projector of a steam-boat. In common with the world, I can but mourn over the poverty of history, that tells not of any previous successful effort of the kind. Steam, no doubt, was known before. The first tea-kettle that was hung over a fire, furnished a clear development of that important agent. But all I can say now, is, that I never heard of a steam-boat, before the "North River" moved her paddles on the Hudson. At that period the invention had not been even heard of on the Mississippi; for it was not until a year after, that a long-armed, high-shouldered keel-boatman, who had just succeeded in doubling a bend in the river, by dint of hard pushing, and run his boat in a quiet eddy, for a resting spell, saw a steam-boat gallantly paddling up against the centre current of that "Father of Rivers;" and gazing at the scene with mingled surprise and triumph, he threw down his pole, and slapping his hands together in ecstasy, exclaimed, "Well done, old Massassippi! Sure, you *have* got your match at last!"

But, as before hinted, it is not my design to furnish a conclusive history of the origin of steam-boats. My text stands at the head of this article; and I purpose here to record, for the information of all future time, a faithful history of "THE FIRST LOCOMOTIVE." I am determined, at least, that that branch of the great steam family shall know its true origin.

In the year 1808, I enjoyed the never-to-be-forgotten gratification of a *paddle* up the Hudson, on board the aforesaid first steam-boat that ever moved on the waters of any river with passengers. Among the voyagers was a man I had known for some years previous, by the name of Jabez Doolittle. He was an industrious and ingenious worker in sheet-iron, tin, and wire; but his greatest success lay in wirework, especially in making "rat-traps;" and for his last and best invention in that line he had just secured a patent; and with a specimen of his work, he was then on a journey through the state of New York, for the purpose of disposing of what he called "county rights;" or, in other words, to sell the privilege of catching rats according to his patent trap. It was a very curious trap, as simple as it was ingenious; as most ingenious things are, after they are invented. It was an oblong wire box, divided into two compartments; a rat entered one, where the bait was hung, which he no sooner touched, than the door at which he entered, fell. His only apparent escape was by a funnel-shaped hole into the other apartment, in passing which, he moved another wire, which instantly re-set the trap; and thus rat after rat was furnished with the means of "following in the footsteps of his illustrious predecessor," until the trap was full. Thus it was not simply a trap to catch a rat, but a trap by which rats trapped rats, *ad infinitum*.

* From the Knickerbocker, or New York Monthly Magazine for April 1839. The Knickerbocker has been much improved lately, the articles not being so wordy—the great fault of American writing—as formerly.

This trap, at the time to which I allude, absolutely divided the attention of the passengers; and for my part, it interested me quite as much as did the steam-engine; because, perhaps, I could more easily comprehend its mystery. To me, the steam-engine was Greek; the trap was plain English. Not so, however, to Jabez Doolittle. I found him studying the engine with great avidity and perseverance, insomuch that the engineer evidently became alarmed, and declined answering any more questions.

"Why, you needn't snap off so plaguy short," said Jabez; "a body would think you hadn't got a patent for your machine. If I can't meddle with you on the water, as high as I can calculate, I'll be up to you on land one of these days."

These ominous words fell on my ear, as I saw Jabez issue from the engine-room, followed by the engineer, who seemed evidently to have got his steam up.

"Well," said I, "Jabez, what do you think of this mighty machine?" "Why," he replied, "if that critter hadn't got riled up so soon, a body could tell more about it; but I reckon I've got a little notion on't;" and then taking me aside, and looking carefully around, lest some one should overhear him, he "then and there" assured me in confidence, in profound secrecy, that if he didn't make a *waggon* go by steam, before he was two years older, then he'd give up invention. I at first ridiculed the idea; but when I thought of that rat-trap, and saw before me a man with sharp twinkling grey eyes, a pointed nose, and every line of his visage a channel of investigation and invention, I could not resist the conclusion, that if he really ever did attempt to meddle with hot water, we should hear more of it.

Time went on; steam-boats multiplied; but none dreamed, or if they did, they never told their dreams, of a steam-waggon; for even the name of "locomotive" was then as unknown as "loco-foco." When about a year after the declaration of the last war with England (and may it be the last!) I got a letter from Jabez, marked "private," telling me that he wanted to see me "most desperately," and that I must make him a visit at his place, "nigh Wallingford." The din of arms, and the destruction of insurance companies, the smashing of banks and suspension of specie payments, and various other inseparable attendants on the show and "pomp and circumstance of glorious war," had in the mean time entirely wiped from memory my friend Jabez, and his wonderful rat-trap. But I obeyed his summons, not knowing but that something of importance to the army or navy might come of it. On reaching his residence, imagine my surprise when he told me he believed he "had got the notion."

"Notion!—what notion?" I inquired.

"Why," says he, "that *steam-waggon* I tell'd you about, a spell ago; but," added he, "it has pretty nigh starved me out;" and, sure enough, he did look as if he had been on "the anxious seat," as he used to say when things puzzled him.

"I have used up," said he, "plaguy nigh all the sheet-iron, and old stove-pipes, and mill-wheels, and trunnel-heads, in these parts; but I've succeeded; and for fear that some of these 'cute folks about here may have got a peep through the key-hole, and will trouble me when I come to get a patent, I've sent for you to be a witness, for you was the first and only man I ever hinted the notion to; in fact," continued he, "I think the most curious part of this invention is, that as yet I don't know any one about here who has been able to guess what I'm about. They all know it is an invention of some kind, for that's my business, you know; but some say it is a thrashing-machine, some a distillery; and of late they begin to think it's a shingle-splitter; but they'll sing another tune when they see it spinning along past the stage-coaches," added he, with a knowing chuckle; "wont they?"

This brought us to the door of an old clap-boarded, dingy, long, one-story building, with a window or two in the roof, the knot-holes and cracks all carefully stuffed with old rags, and over the door he was unlocking, was written, in bold letters, "NO ADMITTANCE." This was his "sanctum sanctorum." I could occupy pages in description of it, for every part exhibited evidences of its uses. The Patent-Office at Washington, like your magazine, Mr Editor, may exhibit "finished productions" of "inventive genius;" but if you could look into the portfolios of your contributors, in every quarter of the Union, and see there the sketches of half-finished essays, still-born poems, links and fragments of ideas and conceptions which "but breathed and died," you might form some "notion" of the accumulation of "notions" that were presented to me on entering the workshop of Jabez Doolittle. But to my text again, "The First Locomotive." There it stood, occupying the centre of all previous conceptions, rat-traps, churns, apple-parers, pill-rollers, cooking-stoves, and shingle-splitters, which hung or stood around it; or, as my Lord Byron says with reference to a more ancient but not more important invention:

Where each conception was a heavenly guest,
A ray of immortality, and stood
Star-like around.

And there it stood, "the concentrated focus" of all previous rays of inventive genius, "THE FIRST LOCOMOTIVE."

An unpainted, unpolished, unadorned, oven-shaped mass of double-riveted sheet-iron, with cranks, and pipes, and trunnel-heads, and screws, and valves, all firmly braced on four strongly-made travelling wheels.

"It's a curious critter to look at," says Jabez, "but you'll like it better when you see it in motion."

He was by this time igniting a quantity of charcoal, which he had stuffed under the boiler. "I filled the boiler," says he, "arter I stopped working her yesterday, and it ha'n't leaked a drop since. It will soon bile up; the coal is first rate."

Sure enough, the boiler soon gave evidence of "troubled waters," when, by pushing one slide, and pulling another, the whole machine, cranks and piston, was in motion.

"It works slick, don't it?" said Jabez.

"But," I replied, "it don't move."

"You mean," said he, "the travelling wheels don't move; well, I don't mean they shall till I get my patent. You see," he added, crouching down, "that trunnel-head there—that small cog-wheel! Well, that's out of gear just yet; when I turn that into gear by this crank, it fits, you see, on the main travelling wheel, and then the hull scrape will move, as high as I can calculate, a leetle slower than chain lightning, and a darn'd leetle too! But it wont do to give it a try afore I get the patent. There is only one thing yet," he continued, "that I ha'n't contrived—but that is a simple matter—and that is the shortest mode of stoppin' on her. My first notion is, to see how fast I can make her work without smashing all to bits, and that's done by screwing down this upper valve; and I'll show you —"

And with that he clambered up on the top, with a turning screw in one hand, and a horn of soap-fat in the other, and commenced screwing down the valves, and oiling the piston-rod and crank-joints; and the motion of the mysterious mass increased, until all seemed a BUZZ.

"It is nigh about perfection, aint it?" says he.

I stood amazed in contemplating the object before me, which I confess I could not fully understand; and hence, with the greater readiness, permitted my mind to bear off to other matters more comprehensible; to the future, which is always more clear than the present, under similar circumstances. I heeded not, for the very best reason in the world, because I understood not the complicated description that Jabez was giving of his still more complicated invention. All I knew was, that here was a machine on four good sturdy well-braced wheels, and it only required a recorded patent to authorise that small connecting cog-wheel or trunnel-head to be thrown "into gear," when it would move off, without oats, hay, or horse-shoes, and distance the mail-coaches. As I was surrounded with notions, it was not extraordinary that one should take full possession of me. It dawned upon me, when I saw the machine first put into motion, and was now full orb'd above the horizon of my desire; it was to see the first locomotive move off. The temptation was irresistible. "And who knows," thought I, "but some prying scamp may have been 'peeping through the key-hole' while Jabez was at work, and, catching the idea, may be now at work at some clumsy imitation! and if he does not succeed in turning the first trick, may at least divide the honours with my friend!"

"Jabez," said I, elevating my voice above the buzzing noise of the machine, "there is only one thing wanting."

"What is that?" said he, eagerly.

"Immortality," said I; "and you shall have it, patent or no patent!" And with that, I pulled the crank that twisted the connecting trunnel-head into the travelling wheels, and in an instant away went the machine, with Jabez on top of it, with the whiz and rapidity of a flushed partridge. The side of the old building presented the resistance of wet paper. One crash, and the "first locomotive" was ushered into this breathing world. I hurried to the opening, and had just time to clamber to the top of a fence, to catch the last glimpse of my fast-departing friend. True to his purpose, I saw him alternately screwing down the valves, and oiling the piston-rod and crank-joints; evidently determined, that, although he had started off a little unexpectedly, he would redeem the pledge he had given, which was, that when it *did* go, it "would go a leetle slower than a streak of chain-lightning, and a darn'd leetle too!"

"Like a cloud in the dim distance fleeting,
Like an arrow" he flew away!

But a moment, and he was *here*; in a moment he was *there*; and now *where* is he!—or rather *where* is he not! But that, for the present, is "neither here nor there."

The incredulous may indulge their unbelief, but for myself, I never see a locomotive in full action, that I do not also see Jabez there directing its course, as plainly as I see the immortal Clinton in every canal boat, or the equally immortal Fulton in every steam boat.

Unfortunately, however, these, like Jabez Doolittle, started in their career of glory without a patent, trusting too far to an ungrateful world; and now the descendants of either may (if they pay their passage) indulge the luxury that the "inventive spirit" of their ancestors has secured to the age.

But my task is done. All I now ask, is, that although some doubt and mystery hang over the first invention of a steam-boat—in which doubt, however, I for one do not participate—none whatever may exist

* It is scarcely necessary to remark, in serious earnest, that the names of Hull, Miller, Taylor, Symington, Jouffroy, and perhaps some others, go before that of Fulton in the history of

in regard to the origin of the locomotive branch of the great steam family; and that, in all future time, this fragment of authentic history may enable the latest posterity to retrace, by "back-track" and "turn-out," through a long railroad line of illustrious ancestors, the first projector and contriver of "The First Locomotive," their immortal progenitor, "JABEZ DOOLITTLE, Esq., nigh Wallingford, Connecticut."

THE POETRY OF THE PENTATEUCH.

THE already high reputation of the Rev. John Hobart Caunter, as a divine and as an orientalist, is likely to receive a large increase from a recent production of his pen, entitled "The Poetry of the Pentateuch, in two volumes (E. Churton, London)." The Pentateuch, or first five books of the Old Testament, are thoroughly and elaborately examined in this work, with the view of throwing light upon the subject of the early Hebrew poetry generally, and of explaining and elucidating every poetical passage within the compass of these books, such passages being naturally the principal ones on which obscurity is found to rest. Mr Caunter has fulfilled this purpose in a manner so able and searching as to leave nothing further to be wished for with respect to grave critical commentary, while, at the same time, the well-known charms of the author's style remove every tinge of dryness from the investigation, and must render the work an acceptable one to the mere lover of elegant literature.

The Hebrew metre is lost or unknown, and many learned men deny that the writers of that nation were acquainted with any regular mode of versification whatever. Other scholars, and Mr Caunter is one of them, maintain that the Scriptural writers most certainly possessed a prosody, although circumstances have buried the knowledge of it in oblivion. The loss of the true Hebrew pronunciation, and with it of the quantities of words, constitutes the chief obstacle in the way of restoring the metre of the language. But Mr Caunter justly holds that the great difference between certain portions of the Scriptures—a difference as great as that between Paradise Lost and Euclid's Definitions—affords of itself sufficient internal evidence of the fact, that the Hebrews had a regulated form of poetical diction, as well as other nations. Not being able, however, to find out the missing prosody or metre, the inquirers into this subject have noticed certain fixed peculiarities of the Hebrew poetry of another kind, and to this subject we shall direct the attention of our readers at present. "One of the great distinguishing characteristics of Hebrew poetry (says Mr Caunter) is that peculiar conformation of the sentences, called by Bishop Lowth parallelism, and divided by him into three kinds: synonymous parallelism, 'when the same sentiment is repeated in different but almost equivalent terms'; the antithetic parallelism, 'when a thing is illustrated, by its contrary being opposed to it'; and the synthetic, or constructive parallelism, 'in which the sentences answer to each other, not by the iteration of the same image, or sentiment, or the opposition of their contraries, but merely by the form of construction.' I shall give one example of each kind from Bishop Lowth's *Prælections*, translated by Dr Gregory. The first example is from Isaiah, being the first, second, and third verses of the sixtieth chapter:—

Arise, be thou enlightened; for thy light is come,
And the glory of Jehovah is risen upon thee.
For, behold, darkness shall cover the earth,
And a thick vapour the nations:
But upon thee shall Jehovah arise.
And his glory upon thee shall be conspicuous.
And the nations shall walk in thy light,
And kings in the brightness of thy rising.

Here it will be observed that every alternate line corresponds with the preceding, the same sentiment being repeated in different but nearly equivalent terms. In fact, the second line of each couplet is a sort of echo to the first, the latter being exegetical of the former. This form of parallelism has been termed, by Bishop Jebb, 'cognate,' because the parallel terms are rather kindred than equivalent, and by a later writer, with juster discrimination, 'gradational,' because the sense shows an obvious gradation of force in the second line, where it advances towards a climax. Now, though in Lowth's version the parallel terms are more strongly discriminated than in our authorised translation, still, those terms will be equally conspicuous there, as will be better seen by breaking the passage into hemistichs, as Bishop Lowth has done. Our Bible translation is word for word, as follows:—

Arise, shine, for thy light is come,
And the glory of the Lord is risen upon thee.
For, behold, the darkness shall cover the earth,
And grow darkness the people:
But the Lord shall arise upon thee,
And his glory shall be seen upon thee.
And the Gentiles shall come to thy light,
And kings to the brightness of thy rising.

steam-navigation, though to him alone is due the honour of first making the invention practically useful. Even the invention of Jabez Doolittle was invented before in our own country: for there is, we believe, incontestible evidence that Mr Symington had steam locomotives going upon the roads at the head of Nithe-dale fully fifty years ago.—Ed. C. E. J.

LIBRARY U.C. ALBANY

The following is a specimen of antithetic parallelism from the Proverbs, chap. xxvii, 6, 7; xiii. 7; xxviii. 11.

The blows of a friend are faithful,
But the kisses of an enemy are treacherous.
The cloyed will trample upon a honey-comb,
But to the hungry every bitter thing is sweet.
There is who maketh himself rich and wanteth all things,
Who maketh himself poor, yet hath much wealth.
The rich man is wise in his own eyes,
But the poor man that hath discernment to trace him out,
will despise him.

In the four pair of lines now quoted, it will be at once perceived that every alternate line is an antithesis to the one preceding; or in other words, it presents a complete opposition of words and thoughts. This form of opposing sentiments and expressions in direct contrast imparts great force and distinctness to both; every proposition, sentiment, or expression, so contrasted, giving an emphasis to its opposite, and fixing it with greater vividness upon the mind, because there is a reflex impression, as it were, conveyed; the one image, so to speak, reflecting the other, while each is heightened and rendered more lively by the opposition of its contrary; they are mutually enhanced by this process. Our common Bible version gives the passages thus:—

Faithful are the wounds of a friend;
But the kisses of an enemy are deceitful.
The full soul longeth an honey-comb:
But to the hungry soul every bitter thing is sweet.
There is that maketh himself rich, yet hath nothing:
There is that maketh himself poor, yet hath great riches.
The rich man is wise in his own conceit:
But the poor that hath understanding searcheth him out.

It will be observed that, except in the first pair of lines, the parallels are as distinctly marked in this as in Lowth's translation, which was especially made to exhibit the parallelisms; and though the former is somewhat less graceful than the latter, it is superior in terse simplicity, and certainly does not fall below it in energy. In the first couplet there is an inversion of the phrase, which destroys its symmetry by disturbing the natural position of the antithetical terms, which Lowth has restored to their proper situation.

The synthetic, or constructive parallelism, is not so obvious as the other two, and is frequently not to be detected by a superficial examination. In the following specimen, however, from the Psalms, it cannot escape observation. (Psalm xix. 7—11.)

The law of Jehovah is perfect, restoring the soul;
The testimony of Jehovah is sure, making wise the simple.
The precepts of Jehovah are right, rejoicing the heart;
The commandment of Jehovah is clear, enlightening the eyes.
The fear of Jehovah is pure, enduring for ever;
The judgments of Jehovah are truth, they are just altogether.
More desirable than gold, or than much fine gold;
And sweeter than honey or the dropping of honey-combs.

'Constructive parallels,' says Bishop Jebb, 'are when the parallelism consists only in the similar form of construction; in which word does not answer to word, and sentence to sentence, as equivalent or opposite; but there is a correspondence and equality between different propositions with respect to the shape and turn of the whole sentence, and of the constituent parts; such as noun answering to noun, verb to verb, interrogative to interrogative. To this description of parallelism may be referred all such as do not come within the two former classes. The variety of this form is accordingly very great. Sometimes the parallelism is more, sometimes less exact; sometimes hardly at all apparent.'

Mr Caunter is thus particular in describing this characteristic of Hebrew poetry, because, in examining the Pentateuch, examples of all the three forms of parallelism are found in abundance. In truth, in the very oldest poem extant, one comprising only six lines, the peculiarity strikingly appears. The address of Lamech to his wives, in the 23d and 24th verses of the fourth chapter of Genesis, is the passage in question, and the words of it, according to the common version, are as follow:—

Adah and Zillah, hear my voice;
Ye wives of Lamech, hearken to my speech;
For I have slain a man to my wounding,
And a young man to my hurt:
If Cain shall be avenged sevenfold,
Truly Lamech seventy and seven fold.

The abrupt and totally disconnected manner in which this passage is introduced into the prose text of Moses, as well as the true meaning of the lines, have caused much doubt and conjecture in the Biblical critics, but all agree in considering it an antique lyric, or a portion of such a composition. Herder, the German critic, says that the Hebrew original possesses a "metrical relation of numbers, and even correspondences of sound." The parallelism is plain in the first and second distichs, the last line of each pair heightening by repetition the force of the first. This little poem is remarkable on many accounts, but chiefly because it probably served as a model to succeeding Hebrew poets, leading to the permanent adoption of the characteristic peculiarities now under consideration.

One of the next passages in the Pentateuch which our author points out as distinguished from the prosaic form, is the blessing of the patriarch Isaac upon Jacob, which displays still more amply the parallelisms alluded to. The words of the benediction, as given in Marsh's version from Herder, are these:—

"Behold I smell my son, as the smell of a field,
Of a field, which God hath blessed.
God give thee, therefore, of the dew of heaven,
The fatness of the earth, and plenty of corn and wine.

Let the people serve thee,
And the nations bow down to thee;
Be thou ruler over thy brethren,
And let thy mother's sons be subject to thee.
Cursed be every one that curseth thee,
And blessed be he that blesteth thee."

"In the third distich, the sense rises in a delicate but obvious gradation (says Mr Caunter), 'nations' being an advance upon 'people,' and 'bow down' upon 'serve.'" The gradational parallelism is in like manner perceptible in the next distich, and the last two lines give an example of the antithetic parallelism.

Looking over Mr Caunter's whole examples of the poetry of the Pentateuch, among which the family benedictions of the dying Jacob, the thanksgiving ode of Moses, and the prophecies of Balaam, may be mentioned as the most remarkable, we find the preceding principles of poetic construction every where pursued to a greater or less extent. Such is also the case with the poetic pieces contained in the remaining books of the Hebrew Scriptures. Every reader, indeed, must have observed the reiteration of nearly equivalent terms and images to be characteristic of the writings in question. Mr Caunter's work, however, will make many aware for the first time, and we confess to being among the many, that this was a form of construction peculiar to the Hebrew poetry from the earliest ages, and that it was purposely adopted and persevered in as a most effective method of giving power and force to poetry, whether by the employment of "gradational advances of meaning," or by the use of antithesis. The reverend author, moreover, shows satisfactorily that there is no repetition of phrases and images identically the same, but that there always is a shade of difference augmenting the effect of the passage. Believing that the parallelisms described are too apt to be set down by ordinary readers as mere reiterations of one and the same thing, the information on this point presented in the work before us is therefore calculated, we are assured, to lead to a much more perfect appreciation of the beauty and power of the poetry of the Hebrew Scriptures.

BERNARDIN DE ST PIERRE'S THREE VISITORS.

BERNARDIN DE ST PIERRE, author of the exquisite little story of Paul and Virginia, as well as of other pieces almost equally admired, spent the closing years of his life at a rural retreat in his native France, removed from all participation in the struggles attending the downfall of the monarchy, and the establishment of the republic. Within a few years after the occurrence of the latter event, he was seated at the window of his small but elegantly arranged study, admiring the opening beauties of the early summer day. The sky was tinted like an orange; the air was rich with perfume. Engaged at the period in preparing his work on the Harmonies of Nature, the poet-novelist might be mentally occupied with the congenial meditations which the scene was fitted to call up, when suddenly a soft and respectful step was heard at the door of the apartment, and a stranger entered without further announcement. St Pierre, seeing the visitor to have a gentleman's attire, and expecting some communication, begged him to be seated; but this invitation required to be repeated once or twice ere it was complied with.

The stranger was a young man of dark complexion, or rather of that southern hue to which the title of pale (sallow is too strong a word) is as applicable as that of dark. A perfect cascade of long black hair fell in waves on the collar of his military coat. His look was at once dignified, pensive, and modest. His upper dress, long boots, and equally long white gloves, bespoke an officer of the French republic, returned from the (first) Italian campaign, which had just spread the terror of the revolutionary arms over Europe. Such was indeed the character of the stranger, as he himself hastened to tell St Pierre, as soon as the emotion caused by the first sight of the novelist had partly passed away.

"I congratulate you, sir," said Bernardin de St Pierre, "upon having served under the famous young captain who has so gloriously finished this campaign. I sympathise in his glory. I, too, have been a soldier."

"With my own will," replied the young officer, "I would not be a soldier long. War is odious to me. I have neither ambition nor hate to gratify, and can see no good, no entertainment in killing. They have embroidered laurels upon the sleeves of this dress of mine; my eyes discern only the blood with which these boots have been stained." The poet stretched out his hand to the soldier. The latter grasped it with enthusiasm, and continued—"Glory! true glory is that which this eloquent hand laboured for and won, while tracing the history of Virginia and of Paul, names eternally seated in the memory—in the hearts of mankind. Ah! this day, sir, is one of the sweetest of my life. I have long prayed that I might live but to see you once, and to describe to you, in manhood,

the delicious moments which my boyhood owed to you. My wish is realised. Behold this treasure of my youth, read amid the confusion of schools and colleges, and also upon the fields of Montenotte and Lodi."

The officer drew from his pocket, as he spoke, a sorely worn copy of Paul and Virginia. Modest as he was, St Pierre felt deeply touched by the enthusiasm of the young stranger, and the more so, as in those days of civil dissension and foreign warring it was very unusual to see a soldier display so much emotion respecting an Indian idyl, and a retired and humble poet. "I love you, young man," said St Pierre, "not on account of your too indulgent admiration for the work of a day, but because I feel that there is between us a community of love for that humanity of which my work is but a feeble inspiration, and for that nature, which furnished me with its colouring. It is but in secret at present that one can avow a love for the Deity, for the skies, for the flowers, and for peace on earth. Discord still reigns at Paris, does it not?"

The young officer's black eyes were full of melancholy as he raised them to heaven, and he begged the poet to change the theme of conversation. Bernardin began to talk of the subject with which his mind was then more particularly versant. He spoke of the harmonies of creation, and in especial of the heavens, on which point the young soldier proved to be an enthusiast. "And the nights of Italy," said the officer, after long listening with delight to St Pierre's discourse on this subject; "each star there is a lasting token and testimony of friendship or of love. If two friends are separated, they promise to look on the same star at the same hour, and its ray is the tie that unites them still. Young girls baptise the beautiful stars of the summer night with their own names and those of their lovers. The firmament there is full of Antoniettas and Ciprianos, of Lucias and Giacomos. If death disturbs these unions, the survivor is consoled by gazing at the yet bright memorial of the object beloved and departed." "This is, in truth, a tender harmony of the south, and not unlike a corresponding one of the north. There two oaks are planted on the occasion of every union of two hearts and souls. The stars in the south, the oaks in the north, Love every where!"

Thus did the poet and his visitor converse for hours, the former delighted to find his tastes and thoughts fully comprehended by the soldier, who seemed to him a spirit of the most refined mould, so modest, retiring, and unambitious, as to be in danger of being trampled down at every turn by those of more unscrupulous and stirring temperament. "But the youth will soon leave the world for some quiet retreat," thought St Pierre, "where he will be happy." The poet had this reflection in his mind when the officer rose to depart. "Stay a moment," said Bernardin suddenly; "such a being as you must have written." The young soldier interrupted him by producing a manuscript, and entreating him, with a blush, to look at the fruit of war's leisure hours. "You will permit me to come again at some time, and breathe with you the sweet morning air of your hermitage?" said the departing youth. "The sooner the more welcome," returned St Pierre, and the nameless stranger took an affectionate leave of the solitary of Essone.

St Pierre found the manuscript left with him to be a pastoral, or a romantic romance. It increased the admiration and love he had begun to feel for the young officer, and it was with considerable anxiety that the retired poet, after some time had elapsed, looked for the return of his unknown friend. But he was disappointed. Several months passed away without bringing the stranger to Essone, and St Pierre had begun to give up hope on the point, when, one evening, while Bernardin was seated in his garden, the visit of an officer was announced. In a few minutes, at the poet's desire, the officer was conducted to his presence. St Pierre had confidently expected to behold his former visitor, but he was in error in his anticipations. The officer now before him showed, indeed, a figure nearly the same as that of the former visitor, as well as the same long black hair, the same dark eyes, and the same southern tint of countenance; yet it was plain to the poet that a different person stood before his eyes. The new-comer was obviously a good many years older than the first. The stranger, like his predecessor, gazed for some moments on St Pierre without speaking, and then he dispelled the poet's surprise by saying, "I am the brother, sir, of an officer of the army of Italy, who had the honour of seeing you some months ago." "I remember him well," returned the poet. "I am come to pay, like him, my respects to one so worthy of far higher tributes." Bernardin bowed his acknowledgments for the praise of the officer, but hastened to enter on a subject more agreeable to his modest nature. "Your brother," said he, "confided to me a manuscript romance, which I am ready to restore to you; and I beg you to inform your brother that I have been profoundly touched with the virtuous purity of his sentiments, and above all with his eloquent indignation against tyranny and ambition. The richness, too, of his style —" Here the officer interrupted the speaker by exclaiming, "Enough, sir, enough! If I permit you to go on with this pleasing eulogy, I will not be able to make the avowal, which I now make, that the piece is my own composition. Not daring to present it to you in person, I persuaded my brother to do it. You must pardon us for the deception."

Ere long, the second officer and St Pierre had en-

tered ardently into discourse. "I was engaged," said the poet, "in considering the harmonies of the heavens when your brother visited me, and now my thoughts are turned to the flowers of the earth." So speaking, St Pierre showed to his visitor many beautiful flowers that were yet in bloom. "But, alas!" continued the poet, "the world at large neglect and despise the knowledge of these earth-born beauties." "No, no," cried the soldier warmly, "you have taught the world to love them. Already have your *Studies of Nature* popularised the taste for flowers in Europe. Enchanted myself with your lessons, I established a botanical horologe in our Italian quarters, and at each hour of the day and night I had a flower that opened its petals. Flowers, sir, are my passion, and I sympathise with the Hollander, who spends his fortune on tulips, and could cheerfully pass my days like him in the unambitious occupation of multiplying their varieties."

Bernardin de St Pierre, who loved all nature, was equally charmed with his new friend's tastes, as with those of the younger brother. Much converse passed between the poet and the flower-loving soldier in little space, until the latter at length rose reluctantly to take his leave. "You will permit me to return?" said the officer. "Return," replied St Pierre, "and bring your brother with you." The officer then departed. The poet sat buried in reflections on the brothers for some time afterwards. "Truly this is a family of simple hearts," thought St Pierre. "The one brother adores the grandeur of the heavenly bodies, and the other passes his regimental leisure hours in cultivating flowers, for the pleasure of seeing one open hourly. And yet these two youths are soldiers! War and revolution have sucked them into a restless vortex, while humble quiet is their proper field and sphere."

Months passed away, and St Pierre was still pursuing his studies in his tranquil retreat. He had not forgot the two brothers; their characters had made a lasting impression on his mind, and, besides, any visit whatever was a rare event at his cottage. France had not forgot him, but France was then too busy to show its remembrance. So St Pierre was left alone. His solitude, however, was a third time broken in upon some months after the second brother's visit. The new-comer was again an officer, and when he appeared before the poet, the latter at first imagined that one of his previous visitors had returned. But, on looking more attentively, St Pierre became assured that a stranger was in his presence, although the dress, the complexion, and the hair, were the same as in the two preceding cases. Struck with the utmost surprise at this triple resemblance, he asked his visitor to be seated, and waited for an explanation from the other's lips.

This explanation was not long withheld. The third officer stated himself to be the brother (second in age) of the two officers who had before been at Essone. "Encouraged by the account given to me of your kind reception of them, I, too, could not refrain from coming to salute the friend of Rousseau, and the author of the *Studies of Nature*."

The third brother soon displayed a mind so inquisitive as to render the conversation between St Pierre and him one of even greater interest than had occurred in the two previous cases. In spite of the fixed character of his principles and opinions, based as they were upon long and deep reflection, the poet and philosopher felt that it was no easy task to bear up in argument against the acute and sifting intellect of the third brother, and which shone powerfully forth in the eagle glance of his eye. Between this visitor and the poet there was no question of stars, or flowers, or nature's other visible wonders. The discourse was of a severe character, yet not devoid of spirit. They spoke of humanity, of philosophy, and of the evils of the times, the old poet talking in an indulgent spirit, mixed now and then with the gall of experience, while the young officer spoke of things with the hopefulness of youth. Bernardin inquired into the favourite studies of his visitor. "Mathematics and history," replied the officer; "to enjoy these, I would fain fly from the world, and spend my days in unambitious retirement." When the time for departure came, the third brother and St Pierre parted with even deeper regret than had been displayed on the occasion of either of the former visits.

"Fate has been kind to me," said Bernardin de St Pierre to himself, "in sending to me these three remarkable brothers; the one capable and worthy of comprehending the calm and holy majesty of the empire of heaven; the other tender and sensitive as Rousseau; and the third sage as Marcus Aurelius, but superior to him in despising the allurements of empire."

Alas! for the instability of human affairs, desires, and opinions!

The first of these officers, who loved the stars of heaven, and who had no ambition, was Louis Bonaparte, afterwards King of Holland.

The second officer, who doted on flowers and botanical horologes, and who had no ambition, was Joseph Bonaparte, afterwards King of Spain and the Indies.

The third officer, who adored humanity, peace, and philosophy, and who had no ambition, was Napoleon Bonaparte, afterwards Emperor of France and King of Italy!

[This little piece is from the French of Leon Gozlan, and, from the author's tone and manner, we may conclude that the sketch is founded upon real occurrences.]

THE RIVER ORINOKO.

It is a remarkable circumstance in physical geography that two of the largest rivers of South America, or, indeed, in the world, should be united by a natural canal. The communication which exists between these two mighty streams, was known to the Portuguese more than half a century ago, but the statements of those discoverers were regarded as incredible fiction; and for a long period it was pertinaciously maintained by systematic geographers that such conjunctions of rivers were impossible. By the enterprise and perseverance of recent travellers, however, it has been proved that not only is this the case with regard to the Amazon and Orinoko, but that it is not a solitary instance of such a thing occurring. We no longer stand in need of analogies or critical reasoning to support the fact. Humboldt has navigated both rivers, and examined and described the singular arrangement of the land which gives rise to the bifurcation. It is now put beyond a doubt that the Orinoko and the Rio Negro flow along a plateau or immense level plain which at this part has no actual declivity. A valley then intervenes; part of the waters of each river run into it, and there uniting, form what has been called the river Casiquari, but which, with much more propriety, might be designated a natural canal. Along this channel of communication MM. Humboldt and Bonpland passed from the Rio Negro to the Orinoko. The navigability of the last mentioned river down to its confluence with the Amazon, is a well ascertained fact; and it is also believed that there are other communications between it and various tributaries of the Amazon.

The river Orinoko is navigable, without difficulty, for 260 leagues, to the rapids of Atures, where its mean height above the sea is, according to Humboldt, not more than 350 feet, so that, as this distinguished traveller remarks, a rise in the Atlantic (a fall in the land would answer the same purpose) of little more than 1000 feet, would submerge considerably above half of the whole continent. From Atures to the point at Esmeraldo where the bifurcation takes place, the Orinoko is navigable for above a hundred leagues more, except at two places where a short land carriage (called a *portage* in American books) is necessary. From Esmeraldo along the Casiquari and down the Rio Negro to its confluence with the Amazon, is at least another 360 leagues, and from the junction of the Rio Negro to the mouth of the Amazon may be calculated at the same distance. Thus proceeding from the embouchure of the Orinoko, up that stream along the others mentioned, and down the Amazon to the sea again, we have an inland navigation throughout the immense space of 3240 miles. But the Amazon is navigable for about 300 leagues above the junction of the Rio Negro with it, which, added to the former summation, makes above 4000 miles of nearly continuous water communication, without taking into account the navigation of the numerous other tributaries of the Amazon and Orinoko. One of these, belonging to the former stream, is called the Guapore. The upper course of this river is within three miles of that of another stream which joins the Paraguay, a great river flowing to the opposite end of the continent where Buenos Ayres is situated. Thus, with the exception of a short land carriage of three miles, water flows and may be navigated between Buenos Ayres, in 35° of south latitude, and the mouths of the Orinoko, in about 9° of north latitude. This, it is to be observed, is in a direction from north to south; in the direction rectangular to it, or from west to east, there is water communication to nearly the same extent, by means of the Amazon and its numerous large tributaries.

There is scarcely any thing in physical geography which excites our admiration more than the manner in which the vast continent of South America is opened up, penetrated and intersected, by mighty currents of water capable of bearing the inestimable riches of the interior to the ocean on the south, or north, or east; for along the western coast extends that imperial rampart of nature, the Andes, impenetrable by any stream, and impracticable for land carriage, except at an expense much too great for commercial purposes. These facilities for intercommunication have not yet been taken advantage of to any extent, for which neglect there are several reasons. The greater part of the course of the Amazon is through a vast unviolated wilderness of vegetation, the most magnificent on the face of the globe, but inhabited by savage tribes, and only here and there sprinkled with catholic missions, the solitary abodes of civilised men. The want of an intelligent population, then, is one of the chief causes why the productions of this richest of all countries are either allowed to go to waste, or are little cultivated. We have often thought that the navigation of the South American continent by means of steam-boats would be an excellent speculation for a British company. There might be a great depot for the reception of goods from the interior, established in the city of Para, at the mouth of the Amazon. We are aware that English companies already exist in this place, but they do not prosecute business on the grand scale which we would wish to see it transacted on. Steam-boats,

flat-bottomed, and drawing little water, ought to be substituted for the Indian canoes, which are the only means of conveying goods at present. Thus might be set on foot an extensive trade in sugar, rice, coffee, indigo, cocoa, cotton (some kinds remarkably fine), bark, and many other valuable drugs, dye-woods, tobacco, numerous sorts of the very finest woods, hides, and many other articles. Intercourse of this description, where mutual benefit is the result, would be the means of spreading civilisation over an immense territory, physically the fairest portion of the earth, but morally a mere desert. If England do not occupy the ground, the United States probably will, and at no distant date.

ENTERTAINMENTS BY EMPLOYERS TO THEIR WORKMEN.

BENEVOLENT and social feeling, apart from intemperance, has always been one of the leading subjects of the present publication. It becomes those, however, who advocate any speculative doctrine, not to throw it to mankind as a barren theory, but to work it out in their own practice, as far as existing circumstances will permit. They thus at once prove their earnestness in the faith, and furnish an exemplification of the efficacy of their doctrine, if any efficacy it really have. Under this impression, the publishers of the present sheet, besides exercising ordinary justice to their working-people in the payment of the highest wages that can be afforded, have considered it their duty to meet them occasionally in a social way, in company with the relatives and a selection of the friends of both parties—not over intoxicating liquors, or in unrestrained mirth and excitement, but in the participation of simple and innocuous pleasures, in the common indulgence of philanthropic views as to the moral and intellectual advancement of our race, and with a self-respect on both sides, which, while perfectly consistent with harmony and friendly feeling, gives sufficient assurance that undue familiarity (for there may be an undue familiarity in all the relations of life) can never be amongst the results of these entertainments. It is, as far as we can ascertain our own motives, with the desire of suggesting similar meetings of the employers and employed, as a means of putting these parties on a more friendly footing with each other, and from no thirst for personal notoriety, that we venture to reprint a newspaper account of the soirée of the 13th June of the present year, with the addition of a few extracts from the speeches delivered on the occasion. The allusions in the report to ourselves are much more flattering than we could have wished in a document to which we are about to give additional publicity; but it would be affectation to make any omissions; and should they expose us to any unfriendly sarcasms, we shall not care, if only the main end—the good end—be served:—

"MESSRS CHAMBERS'S SOIREE—MASTERS AND WORKMEN."

[From the *Edinburgh Weekly Chronicle*, June 15, 1839.]

"We delight in any thing that has a tendency to unite more closely the relation between two important classes of men—the employers and the employed—whose interests are, in fact, reciprocal and the same, and who are mutually necessary to each other. The capital of the one would be valueless if it were not productively employed: the labour of the other would be unproductive of any good to any party, and would be also valueless, if there were not capital to set it in motion. The master and men are like husband and wife: their interests are indissolubly connected, and cannot even be imagined to be distinct or separate—certainly never in opposition to each other. When profits are high, wages will also be high. When profits are low, wages will be affected accordingly, and be also low. The two parties, we repeat, are as husband and wife. They have to journey through life together; and it should be the desire, as it is the interest, of both parties, not to fall out or quarrel by the way, but to make their journey as pleasant, as light, and as happy, as possible. Of the truth of this beautiful principle, our distinguished and excellent townsmen, the Messrs Chambers, and their numerous respectable workmen, seem fully aware. They severally see that their interests are identical, and cannot be separated without injury to both. The one party are industrious, trustworthy, attentive, and faithful, ignorant of what is called eye-service, but most hearty and cordial in their work, knowing that, while by this means they consult the best interests of their employers, they are, at the same time, most powerfully and directly promoting their own best interests, happiness, and respectability. The other party are enterprising in business, kind and courteous to those in their employment, being aware that, while they are

* It is important to note that this species of entertainment possesses features very distinct from those of the annual *trades* given by some employers to their workmen. These features are—the absence of all intoxicating liquors; the presence of the workmen's wives, sisters, or other relatives; the presence of the masters and their wives and acquaintances from first to last; the employment of an instrumental band to fill up the intervals with agreeable music; and the delivery of addresses on subjects of a cheering and uncontroversial nature: the refreshments on the tables during the evening being of a very slight kind, as for instance, after the serving of tea and coffee, the display of fruits, cakes, and lemonade. To insure regularity and decorum, admission is gained only by tickets previously and carefully distributed. The frequent recurrence of public soirees in Edinburgh has latterly raised up a class of tradesmen who make a business of supplying all the material for such entertainments.

thus realising their own interests in the most effectual manner, they are, at the same time, promoting the welfare and improving the condition of the numerous persons to whom in this way they are in the way of affording respectable employment. Last year, as mentioned by us at the time, the Messrs Chambers invited all the persons in their great establishment to a soiree, which went off in a way equally delightful to all parties, and which had a tendency to knit more closely the tie which binds them together in the reciprocal and interesting relation of employers and employed. A second soiree was, on Thursday last, given by the Messrs Chambers; and Mr William Chambers, who acted as chairman on the occasion, intimated that he hoped to see his friends next year at a similar entertainment. The meeting took place in one of the large rooms, or rather halls, of the printing establishment; and while Mr William Chambers admirably discharged the duties of chairman, those of croupier were no less admirably performed by his brother, Mr Robert Chambers. The company consisted of about 160 persons, including several friends whom the Messrs Chambers had invited to join the pleasant party. After tea and coffee had been served, the chairman made an address to his men, full of the finest moral feeling, and the soundest principle, characterised by good taste in every respect, and delivered in the most modest, becoming, and ingratiating manner. He gave discriminating praise to all, even to the youngest, and mentioned by name the heads of departments, whose conduct in their several spheres he characterised in a manner which must have been as gratifying to these respectable functionaries to hear, as it was honourable to the person by whom the compliment was paid. Mr Chambers, before sitting down, entered into some curious and important details as to the literary department of the establishment, of which we will give a few specimens. It appears that 'Chambers's Journal' has been more flourishing last year than at any former period; that it has occupied no less than 3,740,000 sheets of paper during the last twelvemonth, or, in other words, that its average weekly circulation has been 71,923; and that their other works have occupied 1,500,000 sheets, making a grand total of 5,200,000 sheets during the year! To give the information in another shape, we may state that, during the bygone twelvemonth, the Messrs Chambers have printed 10,833 reams of paper; the cost of which, before printing, being no less than about £11,000 sterling. These facts, which are no less extraordinary than gratifying, require no comment. As they are honourable to the talents and public spirit of the Messrs Chambers, they must afford delight to every one who takes an interest in the moral and intellectual improvement of his species. Mr Chambers also stated that, owing to what are foolishly called protecting duties, or rather to a prohibitory duty of about a shilling per pound on English printed books imported into the United States, 'Chambers's Journal' cannot be sent by the proprietors across the Atlantic; and that the edition published in New York costs about *twopence halfpenny* per number, instead of three-halfpence, as in this country; a fact which powerfully shows the pernicious effects of restrictions on trade. The chairman also stated that he bought, at Brussels, a copy of Lamartine's *Travels in the East*, for 6s. 3d., and that, after paying for getting it translated, the Messrs Chambers are about to publish an edition which they will sell at 3s. 9d. or *half-a-crown cheaper than it cost in Belgium*. This is the more remarkable, as the book being originally published in Paris, the Belgian publishers had not to pay any copyright, no more than the Messrs Chambers, while the latter have to disburse a considerable sum as the expense of translation. Wages are lower in Brussels than in this country, so that the great superiority we enjoy over both our continental and American friends, is owing to the greater ability of our workmen, to our improved machinery, and to our cheapness of paper, resulting partly from our superior paper-making machinery, and partly to an unrestricted importation of rags into the country.

Such are some of the important statements made by Mr Chambers. Mr Forsyth addressed a reply to Mr Chambers in name of himself and his brother workmen; a reply breathing the most excellent spirit, composed with great ability—indeed, rich and eloquent in diction—and admirably delivered. We have not room or time to say more. Speeches were delivered, during the evening, by Mr Robert Chambers, Mr Simpson, advocate, Councillor McLaren, and others, all teeming with high moral feeling and elevated sentiment. Mr Simpson's several addresses were characterised by his usual eloquence, benevolence, and philanthropy, and found an echo in the breast of every individual present. The enjoyments of the evening were enlivened by instrumental music, by glees, songs, and recitations. We almost forgot to mention that the company was graced by the presence of ladies, friends of the Messrs Chambers, and by the wives, daughters, and female friends of the various members of the establishment. Would that other masters, not merely in this city, but throughout the empire, were to imitate the Messrs Chambers as to these delightful social meetings between themselves and their men, and thus sweeten the breath of society, and promote the best and most amiable feelings of our nature!

EXTRACT FROM MR W. CHAMBERS'S ADDRESS.

As there are a number of strangers present, I have thought it but right to embrace the opportunity of thanking one and all of you, and of recommending your behaviour to public attention, as I have now done. If any one of those strangers be in the habit of associating the idea of working men with all that is mean and vicious—with wretchedness of attire, ignorance, and intemperance—I bid him look around, and see nearly a hundred individuals belonging to the class of artisans, whose appearance, whose apparel, whose conduct in the discharge of the duties of fathers of families, and in other social relations, will bear comparison with those of any class of persons in the middle and higher ranks of society. These men are frugal, diligent, temperate. Visit their firesides, and you will see, that, generally speaking, they are as clean, orderly, and well furnished with the good things of this life, as the houses of many persons possessing ten times their income. These men also read and think. They have a small library, partly furnished by us, but increased with works purchased from the savings of their own industry. One

book I see they have just added at their own cost—"Russet's History of Modern Europe, in six volumes." I ask every one who hears me—is the spontaneous purchasing and reading of such a work as this any thing like a symptom of demoralised habits, of vicious appetites, or of bad intentions? I think not!

Among men whose general behaviour is so praiseworthy, and whose tastes for literary solacement in hours of relaxation from toil are such as I point out, it would be ridiculous to suppose that there prevails any thing approaching to a spirit of animosity as to the wages of labour. On this point we never have had any disputes. We give, I believe, as high wages as can be reasonably expected, considering the great competition in trade to which we are exposed, the risk of our capital, and the nature of the work done. We wish that all may have liberty to go and liberty to come—every man carrying his labour to the best market, and we encouraging by all the means in our power the attachment of those to whom we give employment. Nothing ever gives us so much pain as to tell a man that we do not any longer require his services. We feel it like cutting off a friend, or losing a relative. Surely, the spectacle of the happy faces now around us, confirms the impression that this feeling is reciprocated. I know it is. There are men present who, I have reason to believe, have been offered higher wages elsewhere, and yet they have not left us. We mark these men; and as long as we have occasion to lift a type or draw an impression, they shall continue in our employment.

EXTRACT FROM THE REPLY BY MR FORSYTH, CORRECTOR OF THE PRESS.

Mr Chairman, Mr Croupier, Ladies and Gentlemen—A more pleasing duty than that in which I am now engaged, has seldom devolved upon me; and I am confident, however poorly it may be performed, that the persons of whom I am the humble organ are not the less deeply and sincerely grateful for the kindness which has been shown towards them.

Gentlemen—The occasion of this our meeting is somewhat of an era in the connection between master and servant. We have heard of many acts of kindness and condescension being exercised towards the humbler party; but it is a circumstance quite new in our experience that an employer should annually call together his numerous workmen, in order to cultivate a friendly intercourse, and thank them thus publicly for their assistance during the year. And, Mr Chairman and Mr Croupier, while this act is the best proof you could offer of your benevolence of disposition, we must also hail it as one of those practically *useful inventions* for the amelioration of the working man's condition, for which you have already become so distinguished. To teach masters and men their respective duties—to soften the asperities engendered by the occasional clashing of interests—and to link all together in the bonds of agreeable fellowship;—at the present moment, when so much of mean jealousy and ill feeling is existing between master and man—this is surely a noble example to show, a benevolent task to undertake, and let us add, a task and an example worthy of the Messrs Chambers. And allow us, gentlemen, to express our conviction that in such meetings are to be found the only legitimate kind of *unions* which can ever subsist in the relations of trade. Workmen's unions, we are sorry to say, have as yet only produced discordance, inasmuch as they have opposed master and man to each other in hostility and bitterness—while such examples as this, if acted upon, promise, by identifying interests and removing prejudices, to constitute an *union* as strong as it shall be durable and all-embracing.

But we must also take this opportunity of declaring that our admiration of your conduct is by no means limited to your origination of meetings like the present. Under whatever aspect it may be viewed, equally, we are confident, will be found subject for respect and admiration. As servants, we can bear testimony to your uniform kind and courteous attention to our welfare—while as men, possessing a common interest in the progress of humanity, we share in the admiration with which your public character is regarded by all classes of the community. Of all the efforts which have been made to simplify knowledge, and spread a taste for reading amongst the lower classes, it may safely be averred that no two men, living or dead, have exerted themselves more ardently and more successfully in this noble aim, than you, our present honoured entertainers. And surely, if society owe a profound debt of gratitude to those men who first opened the long-sealed fountains of knowledge by the invention of printing, something scarcely inferior is due to those who by various ingenious expedients are following up the beneficent designs of their predecessors, and making that knowledge available to the very poorest of the community. The establishment of the Journal was an event in the literature of Scotland which must henceforth be chronicled in its history; and while its success has demonstrated the profound foresight of its originators, it has conferred one of the greatest blessings upon the working classes of Britain, by furnishing them with a variety of cheap, instructive, and amusing knowledge. And we may safely aver, that not only has this Journal been the means of exciting a taste for reading where it did not previously exist, but that it has also dispelled dullness and vacuity from many a humble hearth, and lit them up with the rays of intelligence. But the Journal has not a merely local fame; neither does it solely instruct and delight the population of these islands. I believe it is within the limits of truth to say that it is read in every quarter of the world. Wherever the English language is spoken, has this wonderful miscellany penetrated—and it is by no means improbable that at this moment the solitary backwoodsman of America or the Australian sheep-farmer may be stealing an interval from their labours to pore over the leaves of "Chambers's Edinburgh Journal." It is proverbial that Scotsmen are to be found in every corner of the civilised world,

"From Greenland's icy mountains
To India's coral strand—"

and we can form but a very faint conception of the feelings which must swell their bosoms as they behold this monument of Scottish enterprise following in their footsteps—at once reminding them of home, and bettering their intellect and affections. *

The occasion of this meeting must be a source of deep gratulation to all concerned. The mere fact that it should be held in celebration of the success of an establishment which is at present engaged in disseminating knowledge and enlightening the community, is of itself sufficient cause of joy; but when to this is added the delightful circumstance that we are also met for the purpose of cultivating friendly relations and good feeling between employers and workmen, we have every cause for both joy and gratitude. As individuals, we are grateful for personal favours, while with the great body of the people we join in the exultation which they feel on experiencing the rapid enlargement of the circle of knowledge and happiness.

Mr Chairman and Mr Croupier—Our concluding and sincere wish is—that you may be long spared to continue your present praiseworthy exertions—that you may go on from day to day prospering and to prosper—and that those efforts may ultimately result in the disappearance of ignorance, and in the moral and intellectual regeneration of the great masses of mankind.

SUMMARY OF AN ADDRESS BY MR SIMPSON, ADVOCATE.

He expressed his great pleasure in being present on the occasion, for he considered the Messrs Chambers's annual soiree as an interesting experiment in social philosophy. Last year he compared its orderly good taste, its temperance, its music, its pure and rational enjoyments, with the cock-fightings, bull-baitings, and drunken meetings of the neglected working-classes: this year it had assumed a yet higher aspect, a superior intelligence and

morality, which constrained him to look, not downwards as formerly, but upwards in the social scale, for something to compare it with. He felt that, plain and humble as are its external, compared with many a gorgeous festival which he had witnessed, there was in it a cast of intelligence and lofty feeling, which is not always found at the tables of wealth and fashion, of nobles and princes. When met with ascetics as a visionary in advocating the practicability of guiding the masses of the people by the high sentiments of benevolence and justice—of changing coarseness, violence, and cunning, into refinement, truth, and mercy—he should now be able to point with triumph to the trust-worthy, good taste, and—why should he not say—gentlemanlike conduct, of this company of working men; to the friendliness of the relation here established between the employers and the employed, where even a difference is unheard of—where there has not been one, even the slightest, since the last year's convivial meeting—where the interests of both parties are one, where the masters are the common friends to be loved and served, not the common enemy to be defrauded, resisted, defied, and detested. The working men here, assured that their wages are the highest which the trade will allow, and knowing well what these are, dream not of strikes or combinations. Their unions are *with*, not *against*, their employers. He had himself met in moral discussion with 20,000 working men, and he had not a doubt that one and all could be educated to the full extent of that character, and by proper treatment be brought to the same degree of amity with their employers, which the men of this establishment had attained.

SOLITUDE.

Hail, old patrician trees, so great and good!
Hail, ye pebbles underwood!
Where the poetic birds rejoice,
And for their quiet nests and piteous food
Pay with their grateful voice.

Hail the poor muse's richest manor-seat!
Ye country houses and retreat,
Which all the happy gods so love,
That for you oft they quit their bright and great
Metropolis above.

Here Nature does a house for me erect,
Nature! the fairest architect,
Who those fond artists does despise
That can the fair and living trees neglect,
Yet the dead timber prize.

Here let me, careless and unthoughtful lying,
Hear the soft winds above me flying,
With all their wanton boughs dispute,
And the more tuneful birds to both replying,
Nor be myself, too, mute.

A silver stream shall roll his waters near,
Gilt with the sunbeams here and there,
On whose enamell'd bank I'll walk,
And see how prettily they smile,
And hear how prettily they talk.

Ah! wretched, and too solitary he,
Who loves not his own company!
He'll feel the weight of it many a day,
Unless he call in sin or vanity
To help to bear it away.

—Cowley's Poems.

WONDERFUL DEXTERITY OF INDIAN THIEVES.

Once, during the pursuit of the Pindarries, a considerable amount of money was sent to our camp to pay a large division of the army. Our tents were pitched in a wild, hilly, and jungly country, and as it was known that the treasure was coveted by several of the plundering gangs, a havildar or serjeant's guard was posted to watch the four tumbrils in which the money was contained. Suddenly, in the middle of the night, a gang of these robbers, who seemed to have risen out of the earth, attacked the sepoy's sword in hand, while others attempted to break open the tumbrils. The sepoys made a desperate resistance at the point of the bayonet, and successfully protected their charge until the arrival of reinforcements compelled the plunderers to make a hasty retreat. Several of the robbers were killed, but not before some of the sepoys had received many severe sabre wounds. It would be impossible to give an adequate notion of the craft and perseverance displayed by these robbers in ascertaining the amount and the exact position of any property they may covet, and the almost incredible deceptions they practise on the possessors. Precautions are almost useless for the contrivances employed. Horses ever so securely picketed and guarded have been stolen from the midst of the camp; the whole property in a room or tent has been swept away without awakening the sleeping owner; nay, the very mattress has been removed by a skilful thief, without disturbing the slumbers of the officer by whom it was occupied. I witnessed the performance of this last-named feat when in the camp at Trichinopoly, by one of the Collories, a class of persons noted for their expertness and adroitness as thieves. It was then performed for a wager, to convince an incredulous officer of the surprising dexterity of Indian thieves. When the officer's breathing gave proof of his being in a sound sleep, the Collory entered the room stealthily as a cat, taking with him a small chafing-dish, on which he burned some intoxicating herbs, especially the seeds of the bang or hemp plant, which is nearly as powerful a soporific as opium. He allowed the officer to inhale some of the stupefying fumes, and then gently tickled him with a feather; as he mechanically shrunk from the tickling, the thief adroitly pulled away the mattress, until he succeeded in removing it altogether, when he went out of the room without being detected.—*Bevan's Thirty Years in India.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things : but condescend to men of low estate."
ST PAUL.

"IT'S ONLY THE BIT AND THE SUP."

A FRIEND who resides in the neighbourhood of Dublin related to me the following anecdote :—A man had lived with him for some time, a man of the name of Laurence Cassidy, who was exceedingly fond of doing as little as he could, and taking as much time as possible about that little.

"Larry," said our friend to him one morning, "Larry, you cost me a great deal of money during the year; and you are not worth the third part of what you cost."

"The Lord save us!" ejaculated Larry, casting up his eyes, "what has put the likes of that into yer honour's head?"

"Your laziness, Larry."

"Oh, my law! and I working myself to an oil every day and night of my life; and to say that to me! Well, I did not expect it from yer honour; but, in regard of the cost, yer honour, I wonder ye'd be throwing that in my face; I'm sure the thrifle I gets isn't worth the thinking of such a gentleman as yer honour."

"Trifle!" repeated Mr H—; "you may consider thirty pounds a-year a trifle, if you please; but I do not so consider it, I assure you."

"Bedad, sir, I believe you; I don't know who would; but sure all I ever got from yer honour, night or day, fresh or fasting, was a bare ten pounds—a-year, I mane."

"Ay, wages; but you cost me more than thirty pounds a-year for all that."

"Ya, then! sure it isn't the thrifle of ould clothes you throw to yer fosterers that ye're rising against me, sir, is it?"

"Not at all; what I give, I give; I should be very much ashamed of myself to calculate the ould clothes."

"See that now! Why, thin, yer honour's great in the rule of addition, any way. Will ye be pleased to insense us into it?"

"Ten pounds a-year wages," said my friend.

"Well, yer honour, I'll own to that."

"Twenty pounds, at the very least, your board."

Laurence opened his large eyes very wide, and, looking steadfastly at his master, exclaimed, "Boord, twenty pounds! Twenty pounds for the aiting and the drinking! Oh, yarra machree! whin a gintleman thinks of the bit and the sup, and it only the bit and the sup! it's all up with us! Oh, my grief! is it the bit and the sup? Well, afther that! that bates Bannagher! the masher counting out the bit and the sup!"

Nothing could exceed Larry Cassidy's astonishment and horror that Mr H— should demean himself to think of the eating and the drinking, "the bit and the sup." "And it is always so," he said. Larry's case is by no means uncommon; they cannot comprehend the possibility of what they eat and drink being an expense. I have never found them able or willing to understand it.

I confess that my reason and my feelings have been always at war with each other on this very subject; it is impossible not to admire the frank and hearty welcome, given with the fresh warmth of Irish hospitality, the *caith mille a faultha*, that breathes from every lip, and sparkles in every eye. A sincere welcome to the stranger is always one of the dear and sweet remembrances that we bring from Ireland, but it has a bitter alloy when we remember that the hospitality exercised towards us, and towards others, is, strictly speaking, evidence of wrong thinking. If a man has

a shilling, and owes a shilling, there can be no question as to the fact that he has no right to spend that shilling, save in the discharge of his debt; and yet I know persons who have been hospitably entertained, drank claret and rode hunters, in houses where the dispenser of the hospitality should have eaten his humble fare in solitude, though not in sorrow, and paid his debts. This class of persons cannot in their career of reckless extravagance lay the flattering unction to their souls that they hope to mend their circumstances either by industry or exertion. They do indeed exist in the hope that somebody may die, and leave them, one knows not how much, or they may have had a promise of a place under government; upon such promises I have known dozens of young men fish and shoot, and lounge away the best hours of lives, which, in industrious England, would have come laden like bees with the honey of wealth. But the principle of this, is so deceptive, so bad, so destructive to high and low, that I am tempted to write in stronger terms upon it than many will like—I cannot help it. I confess, while exposing what I cannot but stigmatise as a dishonest hospitality, that there is a decided difference in the manner of display between the two countries; here, when the love of display beyond their means takes possession of a family, they invariably affect the possession of great riches: this is lowering the moral standard of excellence in a piteous degree; an Englishman cannot bear it to be supposed that there is anything which he cannot afford. The Irishman laughs at his poverty, scorns it; he is a man of family, he has something better than wealth to be proud of. He will rejoice with his friends amid the ruins of his house—ruins which the too lavish gift of the "bit and the sup" has occasioned.

The English love of display is dishonest, if the tradesman suffer by it. The Irish hospitality is dishonest, if the host cannot pay his debts. There is one great difference between them—the Irish give with both hands; the English with one.

"Sure the welcome is all we have to give," said a peasant to me. "Sure it's only a potato, a lock of straw, and a sate by the sod of turf," said another. "Sure it's only my time," exclaims a third; "and, lady dear, don't be talking to us as ye would to the quality. Sure they're in debt in many parts of the country, and have the lashings of eating and drinking and company entirely; it's them yer honour ought to talk to." These last words were addressed to me by Mary Flanagan, who, with a family of five children, a blind grandmother, and a lame husband, had done her and hers the injustice of bringing in a piper, his wife and child, during a cold long winter's month, and giving them share of what they had; but the piper and his wife would be always in want, because they had acquired idle and extravagant habits, knew they were certain of support from the cottagers, and spent their money upon whisky. "I am glad to find you so rich, Mary, as to be able to keep your friends as well as your family." "Rich! oh, bedad! yer honour's always laughing at us." "Why, if you were not rich, you could not support Jim Lacy, his dirty wife, and lazy boy." "Lord! yer honour, do you call that supporting, just the bare bit and the sup?" "Have you any thing besides for yourselves?" "Augh, no; sure in dacency we'd give the best bit we had to the stranger." "They have been with you just a month; and now, remember that you have spent on them what would keep your husband, mother, and child, a month; so that if at the end of the year you come asking for a month's potatoes, or a month's milk, I shall put you in mind that you reduced yourself to the disgrace of begging, and just tell you of Jim, his wife, and son.

We have no right to give what God has given us to hold in charge for others; to deny ourselves is right and righteous, but we are not given the goods of others, be it a potato or be it a pound, to bestow on whom we will." I pursued my argument still farther with Mary. "If you wanted to support the piper and his wife, Mary, you should have made them live upon the half of your own potato dinner, and not have given what was hardly sufficient for your family during the year; the consequence will be, that we shall have not only you, but the piper and his family, wanting potatoes by and bye."

"Sure the craythurs could not live on the half of my potatoes."

"But, Mary, with the prospect of your little ones starving before the expiration of the year, you had no right to give away."

"Oh," says Mary, "who knows what may turn up before the end of the year!—sure it was only the bit and the sup." Nothing, however, did turn up before the end of the year, except starvation, and Mary was obliged to ask, as we anticipated, both potatoes and milk. What made it more provoking was, that the money the piper and his wife, and even their boy, had spent in whisky, would have ensured them more comfortable fare than poor Mary Flanagan could bestow.

Floyd of Castle Floyd—I mean the last of his house, who died in C— jail about twelve years ago—inherited what had been a fine property, and was still a good one. He was a cheerful, generous, warm-hearted fellow, full of good intentions, which somehow he forgot to perform. When he came of age, an old, and by some miracle an honest lawyer, who had been his guardian, laid before him a statement of his affairs, pointing out the course by which (selling a part of his estate) he might effectually redeem and preserve the other; this would have left him about nine hundred a-year. He intended to do it. The arrangements were talked of, but not made; the advertisement for the sale of the land was absolutely written out, but not sent to the papers; when one of the hangers-on of Castle Floyd brought the young man's mind to the belief that it would be better to secure Miss Gubbins of Fort Gubbins before the sale, as her father might demur; and poor Frank Floyd had fallen desperately in love with Fanny Gubbins at an assize ball; and, moreover, she had (so said the county) great, very great—expectations. His mentor, the old lawyer, was ill in Dublin, and the young man thought there could be no harm done by putting off the business for a little time. He did so—was beguiled into returning to the open-house system, until, only until, after the wedding. The lady, who had

Brothers and sisters by dozens,
And all charming people, they say,

fond of profusion, and either too young or too uneducated to understand its danger, persuaded her husband to wait till somebody died, for then she was sure money enough would come to pay off encumbrances. After the wedding, open house was of course kept, for the joint honour of Floyd and Gubbins; and then, somehow, Frank's prudence evaporated, and the old lawyer died, having commenced a letter to his ward, beginning, "*beware of the bit and the sup.*"

Never did relations so multiply, full-grown ready-made relations; and when there were not beds enough to accommodate the visitors, why, they very good-naturedly put up with "shake-downs," and any shake, except the shake off. Frank had his moments of reflection, and saw this would not do; but how could he change now! After a little time, all the Floyds and all the Gubbinses were talking of the probability

LIBRARY U.C. RIVERSIDE

of there soon being an heir to Castle Floyd; and all the relations came to wish him joy of the probability of such an event. Great preparations were made for it, and at last it came, and the pretty Fanny and her still-born child occupied the same coffin. This melancholy change removed but few of the household visitors; they all felt too much for "the poor fellow"

"To leave him alone with his sorrow."

Not having any particular faith to keep up his spirits, he took first to claret, and finding that not strong enough to quench grief, strengthened it with whisky. Hours of intense anguish succeeded to frightful fever fits.

Those who really kept open house on his means, declared society was necessary to his existence, and he believed it—believed any thing rather than bring his follies and extravagances to the stern test of thought. The fox-hunters' club always breakfasted and dined at Castle Floyd. Embarrassment was heaped on embarrassment, custodium on custodium. Every thing that could be done to raise money, he did—except rack-rent his tenants.

Still the household expenditure continued unabated until the crash came, and even then a few were not wanting to partake of his prison fare. Many circumstances, of too elaborate a nature to be unravelled in a short story, tended to hasten this catastrophe; and the eaters and the drinkers, shaken off by the strong arm of the law from their prey, set forth to strike down another quarry. This is one of the disgraceful systems so prevalent in Ireland, so totally at war with noble exertion, with that high feeling of self-dependence, that, if I had a thousand voices, I would raise them all against those who would rather eat at another's board than labour to supply their own. Poor Floyd died before he had numbered two-and-thirty years, debased in mind and prostrated in body by dissipation. Two or three only of his once numerous retinue were with him at the last. "Boys!" he said, while the hectic fever, that was soon to yield to a deathlike paleness, gave an unnatural light to his eyes, and a contraction of the throat prevented his swallowing even liquids; "boys! I never refused 'the bit and the sup,' did I?"

"Oh, never," was the true reply.

"And yet it refuses me. Ah, ah! it refuses me," and with this miserable attempt at jest and laughter, he turned on the other side and died!

Mrs Dennis Shannon kept a hosier's shop in Dame Street, Dublin; but widow though she was, and having five daughters to bring up, she loved to entertain her friends. "Sure the drawing-room was there—a beautiful room as any in the city; and the furniture—beautiful furniture; and a party was quite easy to give. She was so used to it; it was only sperm instead of mutton candles; and 'the bit and the sup,' and who'd be mane enough to grudge that, and the chance in it of getting the girls off her hands?"

"The girls," however, did not "get off," but debts "came on." The cheapness of articles of provision is a great excuse in that same city of Dublin; profuse housekeeping people seeming to forget that if things are cheaper, incomes are smaller in proportion; the "bit and the sup" given in such prodigality soon rendered Mrs Dennis Shannon not only minus her drawing-room, but minus her shop; and Betty, the last of her servants, clapt her hands and exclaimed, while tradesmen remained unpaid, and "the girls," brought up in thoughtless extravagance, were billeted upon every Shannon that had a house, "Augh, then, more's the pity!—she never begrudged the 'bit or the sup.'" These are extreme cases, but no one acquainted with Ireland can say that such are of rare occurrence. Thoughtless and fond of amusement, fond of giving, fond of all things liberal, the silent, unobtrusive, even stream of justice is overleaped, and, unfortunately, when a person above the very poorest class falls, he does not fall alone.

"I have been visiting your country," said an English gentleman to me the other morning. "I have spent three months at Ballyray in the most delightful manner. Capital snipe-shooting, capital trout-fishing, and lots of good things."

I was greatly astonished, for I knew the proprietor of Ballyray owed the Englishman a sum of money which I suspected he could never pay.

"Indeed! Well, and did you succeed in your mission?"

"No, I cannot say I did," he answered laughing. "Myself, and horse, and servant, I believe all my family, could have lived board and lodging free all the days of our lives at Ballyray; but as to money, they

have none to give. They are talking of levying fines; so I suppose I shall have some chance, as it is really a noble property. I could not press the matter. Besides," he added, after a little hesitation, "the gentleman's eldest son always calls any one out who asks for money in real earnest, that is, if the debt is considerable."

"And if it is not considerable?"

"Why, then, I believe the servants drag the creditor through the lake—the little lake, not the great one."

God forbid that I should wish people not to help each other; it is one of the privileges of our existence to do so; but the helper should not be expected both to set the machine in motion and keep it going. We all can do something in the great and ennobling labour of independence.

I could fill volumes with the effects of the reckless generosity of those even within a limited sphere, whom I have known and loved. The experience of a few years has shown me so much of the ruin of this system, or rather no system, that I have been severe both with my precepts and examples. I wish to be true in this matter, but unfortunately truth says more than I have ventured to repeat.

There are many Irish persons of good sense who have argued with me, that if a rich relation can afford to support a poor one, he ought to do so; granted, if the poor relation be incapacitated by mental or bodily indisposition from labour; but, otherwise, he does him a severe moral injury to support him without calling his energies into action. The wise man (I hate the word patron; there should be no such words as patron or pauper in an English vocabulary); the wise man will, if he has the means, place his poor relations on the high road to independence, cheer and comfort them on their way, and give them occasionally a helping hand; but he will not doom his own flesh and blood to the degradation of dependence.

The person who in a higher grade of society distributes the "bit and the sup" till he has not a "bit or a sup" left for himself, wrongs those who furnish his supplies. The poor cottager must not persuade himself, that if he gives his own and his children's food to the poor traveller, he wrongs none but his own. Society is so constituted that we cannot wrong only ourselves; "those who give all give none." When Mary Flanagan supported the piper, his wife, and child, for a month, having barely enough to feed her own family until the potatoes came in, she created beggary. It is not for me to point out to the legislature how this system might be changed as regards the peasantry. Something will, I trust, be done, and soon; but I want the peasantry to help themselves. I have seen amongst the Irish peasants instances of self-sacrifice, devoted attachment, elevated and generous affection, that would add laurels to any wreath of national glory. It is because I love them dearly, that I would remove the incrustations of the diamond; I want to make them think and reason.

I said all this and more about three years ago to Jenny Jeffers, who loved to hear her country praised; pretty Jenny Jeffers, who had had twenty pounds and a cottage, a little land, three acres, well stocked, left her by her uncle Bob, who died just when I think he ought to have lived; for poor Jenny was in love with her cousin, "Jumping Jeffers," as he was called, of Ballymote; and her uncle Bob had resolved that Jumping Jeffers should never have a farthing of his money. But what are a dead man's resolves against a living woman's love?

"Sorrah a wildness in him that I know of, except that he'd give the last bit and sup he had in the world to a neighbour," she said; "and that was what turned my uncle Bob against him; 'for,' says he, 'Jenny, avourneen, he has no head.' But he has a heart any how, my lady."

"An Irishman's heart may be as stout as a shillalah, Jenny, but, after all, it's a poor stock in trade for the wants of the world."

"Oh, sure, I've the twenty pounds a'most to the good, to say nothing of the house and farm."

"And your cousin?"

"Oh, sure, he has ——" Jenny paused.

"What, Jenny?"

"Himself, then, and what he stands upright in, sorrah more!" said Jenny, stooping to look for a "lucky pin" she said she had dropped.

"That's not a great deal, Jenny."

"But, sure, my lady, I have a good share of every thing. Praise be to God for it."

"Well, so you have, Jenny, an excellent commencement, and good to keep on with, also; but my great objection to Jeffers is, the quantity of poor relations that besiege him—folk that are not your blood relations at all."

"His mother's people," said Jenny, "and that's thrue for ye, my lady. He has, God help him! a round score, neither able nor willing to do a hand's turn for themselves. More's the shame and the pity! Wild, rollicking craythurs they are, getting into scrapes; but sorrah more harm than that in them."

It was of no use for me to argue with Jenny. When a woman, and an Irish woman especially, takes it into her head to walk deliberately into love's quagmire, why, you may talk to her, and reason with her, but she will not change her mind. If she falls into a passion, you have some chance from the reaction; but if she reasons with you, as Jenny did with me, she is resolved.

"Jumping Jeffers" was married to Jenny, and the sweets of an imprudent honeymoon left their usual proportion of bitterness. A good deal of the twenty pounds was spent in distributing the *bit and the sup* to "his mother's people;" and, under the generosity of the profusion, there frequently runs an under-current of *love of praise*, which stimulates persons not high minded enough for liberality to a reckless extravagance. This was the case with Jeffers; he liked to be thought a slashing, liberal, careless fellow, and he certainly had his desire amongst his own class; his superiors considered him in a different and dangerous light. Time passed on; there was not a Sunday that the "bit and the sup" was not dispensed with a too liberal hand; the drop, also, was too frequent and too strong; and the consequence was, that the pretty quiet cottage of poor Jenny had become occasionally the scene of midnight outrage. This was very distressing to her. She saw the little she had, squandered by a thoughtless unfeeling husband, and the property melting, as it were, away from them. She was too Irish to refuse "the bit and the sup," and she was likely to be left without a home.

There is no country in the world where retrenchment is so difficult as in Ireland; they sacrifice not only their future means of giving, but their future means of living, to the desire of affording present enjoyment to each other. Jenny, urged by her respectable friends, tried to stem the torrent, but she ought to have avoided entering the stream.

"It's only Bill Casey and the two boys of the Ban, Jenny," her husband would say to her remonstrance. "You can't refuse them the 'bit and the sup,' and they come so far! Don't let us disgrace ourselves before decent people by having nothing to give, Jenny; bring out the long bottle, *achorra!* Do."

"I can't—I cannot; it's no use now; leave me alone; just say you havn't got it. Sure you know our last guinea's upon the go, and not a seed in the ground yet. My goodness! how can you behave so? It's no use, I tell you again! Now, be quiet—we'll be ruined all out; you havn't done a hand's turn at the farm, and there'll be nothing to pay the rent, small as it is, the way you're going!"

This difference of opinion ended as usual; the husband had his way; and, truly, when "gale-day" came, there was nothing to pay the rent. The neighbours said how it would be; but Jeffers had still "the bit and the sup" to give, though Jenny went without stockings during the week, and her pleasant cheerful voice was now seldom heard in song or laughter. The next rent-day arrived, and the same story was told to a landlord who had hitherto been just and kind. Landlords are too often the contrary, but this man was poor, and could not do without his money. When tenants refuse to pay rent for the advantages they enjoy, they ought to consider how utterly impossible it is for their landlords to exist without money, and remember that they themselves expect to be paid for the butter, fowls, eggs, and corn, they take to market. Jeffers, however, could not pay; his wife's money had been squandered, and he had neglected their little crops for the sake of amusement; his landlord's expostulations were, in his wife's absence, returned by insolence; his landlord threatened, what his tenant dared him to perform. When Jenny entered, she found her husband half mad with whisky and rage; he had good reason to believe his landlord would distrain, and had sent for Bill Casey and his companions to prevent it. Poor Jenny, finding she could not turn her husband's purpose, and knowing how he had exasperated his landlord, resolved to appeal to the generosity of an aunt, who lived at some distance, in this time of peril, and set forth in a state of agitation better imagined than described, having first prevailed upon a female friend to remain in the house during her absence, to prevent every thing in it from being destroyed. "He'll give the 'bit and sup' to the last," she said, as distinctly as she could speak for tears; "and if you don't watch, Aileen, the dresser from the wall, and the bedstead from under us, will be sold for that same."

Poor Jenny entreated them all to be patient till her return, but she might as well have expected patience from a March whirlwind; they had been so long accustomed to lawless deeds, that they were much better pleased with the prospect of the landlord's putting his threat into execution, than with the hope of his forbearing altogether.

Jenny, poor Jenny, had a long and weary journey. She had endeavoured, before she set out, to see her landlord, but he was from home, and perhaps for the first time in her life she did not squander her time. Her aunt was old, and cross, and fractious, yet she obtained her desire, and turned towards home with an anxious heart, but many good resolves in case of her husband's persisting in his ill conduct. She had been offered a home with her aunt; but, in truth, the constant-hearted woman prayed more earnestly for his reform than for her own release. She had journeyed the greater part of the night; but when she arrived at the end of the *bóhren* that led to her cottage, although it was the very earliest morning, sounds of tumult struck upon her ear, and she flew rather than ran towards her cottage. When she came in sight of "the bawn," she beheld a scene of confusion too frequently witnessed in Ireland—the

* Rent-day.

landlord was attempting to fulfil his threat, and had been resisted.

One violence brought on another; the police had, it would appear, seized a couple of pigs, which, by an ingenious device of Jeffers, had been placed in his sty to mislead the agents of the law. A scuffle had ensued; her husband was struggling on the ground with two of the men; and her friend, whom she had left to keep peace and preserve order, was whirling stones from her apron upon the assailants, in a way that left no doubt of her intention.

The half-suffocated screams of her husband urged her to phrenzy. Impelled by an impulse she had no time to reason with, or strength to resist, she flew to his rescue, seized a wattle that lay in her path, and succeeded in drawing off the attention of one of the men from her husband. Jeffers took immediate advantage of this rescue, and rallied with his friends, so as to be able to make a retreat, which ended in flight; but one of the bailiffs was so severely injured that his life was despaired of. Poor Jenny and her friend were carried to the county jail, amid the tears of her acquaintances, who, but for her earnest and well-managed entreaties that they would keep the peace, and commit no second outrage, would most certainly have rescued her. The man who had been so severely beaten by Jeffers died, but his companions bore testimony to his having received the injuries which caused his death, before the women interfered in the least with the fray, and certainly before Jenny's arrival at the scene of contest. The verdict returned was one of murder against Jeffers and Bill Casey. Poor Jenny endeavoured to support her friend's spirits and her own. The latter were considerably relieved by the information, secretly given, that her unfortunate husband had escaped from the country, though the bitterness of heart she experienced in the knowledge that he had left her without one love token, one kind message, after all she had done and suffered for his sake, was hard to bear. If it had only been "a God be with you, agra, or a lock of his hair; and he gone for ever from the sight of my eyes; though I pray that God may pity him as I do. And he may be at this moment tossing on the wide ocean, with the fresh air of heaven about his head, and the free waters of the Almighty rolling him to a free country; while I'm here, my heart crushed in my body, between the hard walls of a jail. Oh! it's hard to bear, it's hard to bear; sure I couldn't stand to see him murderin', and he my husband. I couldn't stand that, any how; and how'll my people ever stand the disgrace!—and all that he, poor fellow, gave the *bit and the sup* to with both hands, scattered by the law and their own devilment. Oh, my grief! But keep a good heart, *arounneen*; you shan't be worse off than me, that you shan't, and the day will soon come, and be soon gone too. God tache us the right way!"

There was something in Jenny's uniform good intentions, though she had failed to carry them into action, in her fond yet foolish attachment to her worthless husband, that interested us all in her behalf; and greatly pleased were we to hear of a fine of a few pounds, with the alternative of three months' imprisonment, named as her punishment, for we knew that she could easily contrive to raise the money. A morning or two after the termination of the assizes, we accompanied some friends to visit the jail, and to our great astonishment, there, in the female ward, was Jenny, spinning away, her black hair braided back neatly as usual, and her aspect more composed, more calm, than we had seen it for months.

"Why, Jenny, how is this? We thought you had gone to your aunt's."

"Thank ye, madam," she answered; "but my people's very angry with me—very angry with me intirely; and when my time's up here, I'm thinking I'll have to go to sarvice, for indeed I shouldn't be able to go begging for the '*bit and the sup*,' though many begged it from me. I might have kept it to be sure; but *all we can do with spill milk, is to cry over it*, my lady."

"And not spill it again, Jenny?"

"Bedad, ma'am," said Jenny smiling, "it's great luck entirely we must have to win the chance of spilling it *twice*!"

"But, Jenny, how came you here now? Surely if you could not raise enough to pay the fine on your own place, your friends would do it for you."

"As to my poor little place, it's altogether gone to the bad; and sure my people did raise it, God bless them!"

"And why are you here?"

"Ah, ma'am, that's a bird of fresh feathers. You see, my lady, that misfortunate morning I warned poor Ailey to take care of the dresser and the bits of things; and that drew her into the ruction, poor craythur; and sure, ever since she's been here, on my account as a body may say, there's been no child's hand to give a drink of water to her ould mother, or look after any thing in their little house; so, my lady, I paid her ransom instead of my own. She's gone free to her mother, God be praised! and though my aunt's mad with me, I have their blessing, and the knowledge that I did right—to strengthen me against the trouble."

The noble-hearted woman deserved the strength her self-sacrifice created; and though, before our converse had finished, she bowed down her head and wept bitterly as she said herself over the "spill milk," and, above all, at the remembrance of her husband's heart-

less conduct, still her tears were not those of despair, though her own folly will oblige her to trust to that charity which she squandered. If she had learnt the wise lesson of withholding judiciously, she might still have had the "*BIT AND THE SUP*" to share with those who really needed.

AGE AND SIZE OF TREES.

WITHIN the last three or four years, several works of great merit have been published in America and France, in which the age and size of trees have been discussed in a very philosophical manner. M. Decandolle, the greatest botanist in Europe, as far as the physiology of plants is concerned, has given to the world an elaborate and profound paper, entitled "*The Antiquity of Trees*." In this valuable contribution to science, the author has embodied the results of many years' investigation of the subject, and some of them are of such a nature as to startle us not a little. When, for instance, we are told, that, by calculations which are at all events made on ingenious and plausible principles, there is every reason for believing in the existence of trees that were contemporaries of the first generations of men, and probably witnesses of the last great changes of the globe which preceded the creation of the human race, our curiosity is excited in the liveliest manner to know by what mode of observation and process of reasoning philosophers arrive at such extraordinary conclusions. It is simply by counting the concentric circles in trees. This method of computation is not admitted by all botanists; but if those trees, called by Decandolle *exogenous*, form annually an external woody deposit, which is distinctly marked in the timber like a ring, and which remains indelible, and if this process is regularly continued from year to year without interruption or failure, then we can see no reasonable objection to it. The number of these concentric circles seen on a horizontal section of a trunk will inform us how long a tree has lived, as a section of a branch gives us the age of that branch. "This method," says our author, "is not liable to much error, and is a simple criterion to ascertain the age of a tree; but the inspection of these concentric circles must be made with the greatest care. By their number they give the age, and the degree of their thickness gives also the rate of their increase; therefore they should be measured as well as counted. My plan is as follows: When I have got a section of an old tree, on which I can see the circles, I place a sheet of paper upon it, extending from the centre to the circumference. On this paper I mark every circle, showing also the situation of the pith, the bark, the name of the tree, the country where it grew, and any other necessary observations. I also mark in a stronger manner, the lines which indicate every *ten years*, and thus I measure their growth at *ten years' intervals*. Measuring from centre to circumference gives me the circles, doubling this I have the diameter, and multiplying by six I have the circumference."

The learned professor then presents a table of the periods of increase in the diameter of various trees; an inspection of which proves that every tree, after having grown rapidly when young, seems at a certain age to take a regular march of growth, which may perhaps be accounted for by supposing that young trees have more room to expand in, are less pressed by the roots and branches of their neighbours, and may not have penetrated down to a hard, arid, or otherwise unfavourable soil; and also, that as trees advance in age, they still continue to form layers as thick as they previously did subsequently to the period of rapid growth. If such tables were multiplied to a sufficient extent, as we have no doubt they will be in course of time, they would form data from which, by ascertaining the circumference of a tree, its age might be known without having recourse to the destructive process of cutting deep into the growing timber. "If," says Decandolle, "one cannot get a transverse section of a trunk, then one must seek for old specimens of each kind, the date of whose planting is known, measure their circumference, deduce their average growth, and calculate from them the age of other trees of the same kind, always keeping in mind that young trees grow faster than old ones." Decandolle cites instances of trees whose ages have been ascertained according to the rule here laid down. Some of these we shall present to the reader, along with descriptions of other trees obtained from a variety of sources, particularly American publications.

A certain *Baobab tree* of Africa is considered by Humboldt as the oldest organic monument of our planet; and Adanson, a distinguished botanist, by ingenious calculations, has ascertained its age to be 5150 years. The method adopted by Adanson for finding its age, was by making a deep cut in the side of the trunk, and counting the concentric rings, by which he ascertained how much the tree had grown in three centuries; and having already learned the growth of young trees, he established his general law through the average growth. The enormous dimensions of the trunk of this tree bear a striking disproportion to the other parts. Examples of the species

have been seen, which, with a trunk ninety feet in circumference, were only twelve feet in height. A still larger was seen by Mr Golberry in the valley of the two Gagnacks in Africa; it was thirty-four feet in diameter. The flower is of the same gigantic proportions as the tree. Such colossal masses of timber might be hollowed out into by no means straitened dwelling-houses.

One of the most celebrated trees described by travellers of recent times, is the *Great Dragon tree* of the island of Teneriffe. It derives its name of *dragon's-blood*, by which it is popularly known, from the circumstance of a liquor of a deep red colour like blood flowing from its hoary trunk during the dog-days. This exudation soon becomes dry and brittle by the action of the atmosphere, and is the true dragon's-blood of the apothecaries, and other vendors. The wonderful size and appearance of this tree excited the admiration of Humboldt, who thus describes it:—"We were told that the trunk of this tree, which is mentioned in some very ancient documents as marking the boundaries of a field, was as gigantic in the fifteenth century as it is at the present moment. Its height appeared to us to be about fifty or sixty feet; its circumference near the roots is forty-five feet. * * The trunk is divided into a great number of branches, which rise in the form of a candelabrum, and are terminated by tufts of leaves, like the yucca which adorns the valley of Mexico. It still bears, every year, both leaves and fruit. Its aspect feelingly recalls to mind 'that eternal youth of nature' which is an inexhaustible source of motion and of life." This giant plant was laid prostrate by a tempest in 1822.

The fact here noticed by the learned traveller, that the tree annually bore leaves and fruit, affords indubitable proof of a very remarkable circumstance connected with the vegetable kingdom. In man and all other animals, we find an organisation and a process of life going on which is destined to cease at a certain period. Mortality is written in irrevocable characters on every thing which treads the earth, or wings the air, or cleaves the flood. Life in these, is like sand in the hour-glass; its very motion, so to speak, involves the necessity of its becoming exhausted at last, and ceasing to move. But it is otherwise with trees. They appear to possess the power of growing on for ever without exhibiting any symptoms of decay, unless from accidental or extraneous causes. We shall quote the words of Decandolle on this point. "As there is formed every year a ligneous deposit, and generally new organs, there is not among the vegetable creation place for that hardness or rigidity, that obstruction of old and permanent organs, which constitutes properly the *death of old age*, and, consequently, that being the case, trees can only die from accidental causes. Trees do not die from age in the true sense of the word; they have no fixed period of existence; and, consequently, some may be found that have arrived at an extraordinary age." But although a tree thus possesses in itself the elements of continual strength and youth, numerous causes step in to interrupt or destroy its existence. In corroboration of what we state, we need only allude to the facts, that soil is of limited depth—that, below the soil, there are usually hard strata, which the feelers of a plant cannot penetrate—that roots intercrossing encumber each other, and check vegetation—besides which, there are other destructive and obstructive causes which we need not occupy the reader's time by specifying. Consequently, although what the French philosopher says is quite true, that "some (trees) may be found that have arrived at an extraordinary age," yet, every circumstance considered, we are not to be surprised if the number found should prove exceedingly small, compared with the immense extent of the earth's surface which is covered with forest trees.

Cypresses of gigantic dimensions are met with in Mexico. At Atlixco there is one seventy-six feet in girth; and another at St Maria del Tuli, in the province of Oaxaca, which is one hundred and eighteen feet in circumference! This is larger than the dragon tree of the Canaries, and all the baobabs of Africa. "But," says Humboldt, "on examining it narrowly, M. Anza observes, that what excites the admiration of travellers is not a single individual, but that three united trunks form the famous *Sabino* of Santa Maria del Tuli." The fact of the threefold nature of the stem, seems to have escaped the notice of some writers; it is of importance in determining which is really the largest organic monument of our planet. There is another cypress at Chapultepec in the same region, which is said to be one hundred and seventeen feet ten inches round, and the younger Decandolle considers it even older than the baobab of Adanson. If the measurement here given be correct, and the tree consists only of one stem, we are entitled to regard this Mexican cypress as the most gigantic and ancient tree hitherto discovered on the globe. Hunter says that in 1776 there existed in the garden of the palace of Grenada, cypresses that were celebrated even in the time of the Moorish kings, and which were named *Cypresses de la Regna Sultana*, from a sultana who was seen sitting under it with a lover, who was one of the Abencerrages. They are supposed to be eight or nine hundred years old. Strabo mentions a Persian cypress in girth as much as five men could span, and he believed it to be two thousand five hundred years old. But this must have been guess-work; at least we are not aware that he made the computation after the skilful manner of Adanson or Decandolle. Mi-

chaux, a Frenchman, has published a splendid work on the forest trees of the United States. He says that the largest stocks of the cypress are one hundred and twenty feet in height, and from twenty-five to forty feet in circumference, above the conical base, which at the surface of the earth is always three or four times as large as the continued diameter of the trunk. Cypress are among the trees in the south of Europe which live to the most advanced age; and the custom of planting them in cemeteries and consecrated ground, ensures respect being paid to them, and thus affords botanists the means of measuring them.

The Oaks are amongst the patriarchs of Europe, but they have been treated at sufficient length on former occasions. Yews are believed to be the most ancient trees of Great Britain; and no doubt can exist that there are individuals of the species in England as old as the introduction of Christianity, and there is every reason to believe a very great deal older. It is the opinion of Decandolle, that of all European trees the yew is that which attains the greatest age. "I have measured the deposits of one of seventy years; Celhafen has measured one of one hundred and fifty years; and Veillard has measured one of two hundred and eighty years. These three measurements agree in proving that the yew grows a little more than one line annually in the first one hundred and fifty years, and less than a line from one hundred and fifty to two hundred and fifty. If for very aged yews we take the average of one line annually, it is probably an admission beyond the truth; and thus in estimating the number of lines and years as equal, we make them younger than they really are." We think this reasoning very plausible, and point out to such of our readers as may have opportunities of seeing old yew trees, how easily they may ascertain their age.* The line here spoken of is one-tenth of an inch. The circumference may be taken just above the base of the tree; the third of this measurement gives the diameter, and every inch of diameter is equal to ten years. There are four measurements of venerable yews in England—those of the ancient Abbey of Fountains, near Ripon in Yorkshire, which yews were well known as early as 1155. Pennant says that in 1770 they were 1214 lines in diameter, and, consequently, were more than twelve centuries old. Those of the churchyard of Crowhurst in Surrey, on Evelyn's authority, were 1287 lines in diameter. There are two remarkable yews still in the same cemetery, and if they be the same which Evelyn refers to, they must be fourteen centuries and a half old. The yew tree at Fortingal in Perthshire, mentioned by Pennant, in 1770 had a diameter of 2588 lines, and, consequently, we must reckon it at from twenty-five to twenty-six centuries old. The yew of Brabourne churchyard in Kent has attained the age of 3000 years; but that at Hedsor in Bucks surpasses all others in magnitude and antiquity. It is in full health, and measures above twenty-seven feet in diameter; consequently, according to Decandolle's method of computation, this yew has reached the enormous age of 3240 years! In all likelihood this is the most ancient specimen of European vegetation.

The Elm attains a very large size, and has a very rapid growth, both in Europe and America; but the elm of the latter country has a much more majestic appearance than that of Europe. Michaux characterises it as "the most magnificent vegetable of the temperate zone." A specimen mentioned by Decandolle, which grew near the town of Morges in Switzerland, measured seventeen feet seven inches in diameter, and was estimated at three hundred and thirty-five years of age. He informs us that it grew on an average three lines and a half yearly; but dividing its growth each century, it grew six lines annually the first, two and a half the second, and two and three-fourths the third; and this growth agrees with that of those elms planted by order of Sully before the Chambers in France. Every one who has it in his power to ascertain the rate of growth of trees, ought to do so, as he is thereby not only gratifying a rational curiosity, but conferring a benefit on science. Wherever the age of an elm or other tree is correctly known, its girth should be taken, and a plain statement of the species of tree, the nature of the soil where it grew, its diameter and age, transmitted to any journal, the special object of which is to take cognisance of the vegetable kingdom. We are certain that hundreds of our readers have this in their power. Indeed, Decandolle earnestly solicits the attention of English botanists to the subject; for it is only by an extensive accumulation of individual facts that general laws can be established.

One of the most curious and beautiful of nature's productions, is the Banian or Burr tree, the *Ficus Indica* of botanists. Each tree forms in itself a grove, composed of numerous stems connected together, some of which are of the size of a large tree. On the island of Nerbuddah, near Baroach, in Hindostan, there is still standing a celebrated banian, called the *Cubber Burr*. The tradition of the natives is, that it is three thousand years old. It is supposed by some to be the same tree that was visited by Nearchus, one of Alex-

ander the Great's officers. The large trunks of this tree amount in number to 350, the smaller ones exceed 3000, and each of these is constantly sending forth branches and hanging roots to form other trunks. The circumference of this remarkable plant is nearly 2000 feet. Milton, in his "Paradise Lost," has described one of these trees as that of whose leaves our first parents "made themselves aprons" after the fall.

"Soon they chose
The fig-tree, not that kind for fruit renowned,
But such as at this day, to Indians known,
In Malabar or Decan, spreads her arms,
Branching so broad and long, that in the ground
The bended twigs take root, and daughters grow
About the mother-tree, a pillar'd shade
High over-arched, and echoing walks between."

The Lime is the European tree which, in a given time, appears capable of acquiring the largest diameter. Decandolle has some observations on the rate of growth of this tree, which may prove useful. He says, "That which was planted at Fribourgh in 1476, on occasion of the battle of Morat, has now a diameter of 13 feet 9 inches, which would give about two lines of annual diametric growth. This is about the rate of the increase of the growth of an oak, and therefore, I suppose, the tree had not found a favourable soil, and it would be nearer the truth to calculate the annual growth of the lime at four lines. There are in Europe a great number of limes of large size, and it would be interesting to have the circumference of those whose date is known. I shall mention for their size that of the Chateau of Chaillé, near Melles, in the department of the Deux Sèvres, which in 1804 measured 15 metres round (about 50 feet), and which I suppose was then five hundred and thirty-eight years old; that of Trons in the Grisons, already celebrated in 1424, which in 1798 measured 51 feet in circumference, and which I calculate to be five hundred and eighty-three years old; that of Depeham, near Norwich, which in 1664 was 8½ yards in circumference; and that of Henstadt in Wurtemberg, which in 1550 was so large as to have need of props, and which in 1664 was 37 feet 4 inches in circumference. One must distinguish between the large and small leaved limes, as the former appear to grow faster than the latter." There appears to be a mistake in regard to the Depeham lime. We suspect it is the same mentioned by Sir Thomas Browne, which he says was 90 feet in height, and 48 feet round at a foot and a half from the ground. He also describes a poplar near Harling as of nearly the same dimensions. The largest now known in England grows in Moor Park, Herts.

The Oriental Plane is one of those trees which attain the largest size, but the rate of its increase is not ascertained. In the valley of Bujukderé, about three leagues from Constantinople, there is a plane which recalls to mind one which Pliny has celebrated. According to the Roman naturalist, there was a plane-tree in Lycia, which had a hollow trunk capacious enough to accommodate the consul Licinius Mutianus and eighteen followers, who found within its ample cavity a retreat for the night. This living vegetable grotto was 75 feet in circumference, and the summit of the tree resembled a small forest. The plane at Constantinople is 150 feet round, and within it there is a cavity of 80 feet in circumference. This transcends the tree of Pliny. There are other very large oriental planes mentioned by Clark and others, and one of vast size was lately noticed by Mr Quin in his voyage down the Danube. For the information of our readers, we may mention that in the eastern states of the North American Union, this tree is called Button-wood, and in the western states Sycamore. Under the latter appellation, Mr Flint, the distinguished geographer, styles it "the king of the western forests. It is the largest tree of our woods, and rises in the most graceful forms, with vast spreading lateral branches, covered with bark of a brilliant white. A tree of this kind near Marietta (Ohio) measured 15½ feet in diameter. We have seen one on the Big Miami (a river), which we thought still larger. Judge Tucker of Missouri cut off a section of a hollow trunk of a sycamore, and applied a roof to it, and fitted it up as a study. It was regularly cylindrical, and when furnished with a stove and other arrangements, made an ample and convenient apartment." But buildings of a more extensive description than the above have been constructed out of this tree. We learn that a hollow trunk of an enormous sycamore was fitted up with the requisite appendages, and made use of at Utica in New York state as a retail shop; and it was afterwards carried to the city of New York for a show. We extract from the *New York Traveller* the following notice of such another extraordinary domicile, or in all likelihood the same as that made use of at Utica. It was exhibited in the saloon of the American Museum in New York. "A sycamore tree of most singular and extraordinary size has been brought to this city from the western part of this state. The interior is hollowed out, and will comfortably accommodate some forty or fifty persons. It is splendidly furnished as a sitting-room, and contains every article of elegance and usefulness. It has a handsome piano, sofas, glasses, and mirrors, of fit and becoming style, and is decorated with pictures and fancy articles." The reader is not to class this account with the many incredible trans-Atlantic stories which are imported into this country. We have no reason to doubt the fact; but it seems quite clear that the apartments must have been hollowed out of the tree lengthways, its diameter affording sufficient height for them.

There are still some trees of a very remarkable size or age which remain to be described, but we can only briefly notice the most celebrated of them. In the Garden of Olives at Jerusalem there are now existing eight olives, which can be proved by historical documents to have existed anterior to the taking of Jerusalem by the Turks, and which consequently must be at least 800 years old. A writer in the North American Review remarks, that the largest oak, and indeed the largest tree he has seen in that country, is an oak about twenty-seven feet in circumference at the smallest part. Its age he computes at not less than 500 years, so that it must have been a majestic tree at the time when Columbus discovered the western world. We wish he had told us its girth immediately above the base, but it is quite clear that this oak must be a stupendous organic fabric.

In 1804, Decandolle saw at Gigean, near Montpellier, in France, an ivy, the trunk of which near the base was six feet round, and whose immensity, he says, was truly astonishing. Another ivy, only forty-five years old, was only seven and a half inches round; so, taking it as a general type, the specimen at Gigean in the year 1804, ought to have been of the age of 435 years. We have nowhere seen mentioned an ivy of such colossal dimensions. A writer in the North American Review mentions wild grape vines of enormous size. He says that, whilst in the eastern states, and, we may add, in Europe, it "rarely grows larger than a stout walking-stick, in our western states it sometimes surpasses, in diameter, the body of a full-grown man. This fact we have verified by actual measurement."

Amongst the largest flowers, are those of an *Aristolochia* of South America, which are four feet round: the Indian boys, in their sports, draw them over their heads as a cowl. Probably the largest flower-cup in the world is that of the *Rafflesia* of Sumatra, in the East Indian seas, which is nearly three feet in diameter, and weighs fourteen pounds. The largest leaf is that of the Talipot, which has been measured, and found eleven feet in length, and sixteen in breadth. It was used as a parasol, and screened six persons at table.

MR ROBERTS'S EXCURSION—SECOND LETTER.

In our 375th Number we took the liberty of reprinting, from the *Athenæum*, a letter from Mr D. Roberts, descriptive of his professional tour in Egypt, and dated Cairo, the 24th of December. We have now the satisfaction of offering a second letter from that gentleman, dated St Jean d'Acre, April 25, 1839, which has been lately received by one of his friends in this city, through whose kindness we have been favoured with a copy for publication. Being descriptive of Mr Roberts's movements through a region of singular natural features, and full of the most extraordinary remains of antiquity, it cannot fail to prove interesting to our readers.

"My dear —, I take the earliest opportunity—that of a rainy day, sitting under my tent opposite the celebrated St Jean d'Acre, and who knows but on the same spot which *Cæsar de Lion* himself may have occupied under similar circumstances—of letting you know that here I am thus far on my way homewards, after a journey of nearly three months through the Desert and Syria, and in as good health as I ever enjoyed in my life. I look forward to reaching England in two months more, fully prepared to do something desperate in the way of art, or at all events to make the best possible use of the great variety of materials which I have collected for the purpose. But to the narrative of my wanderings: After my return from Upper Egypt and Nubia, I passed six weeks in Cairo, partly in taking sketches of its mosques and bazaars, and partly in preparing for my journey across the Desert. An English gentleman and I having arranged to visit Petra together, we were joined by a countryman whom you know, Mr —, from Edinburgh; he happened to be in Cairo at the time, and having a few weeks to spare, joined us, making altogether a party strong enough to face any band of Arabs from the Desert of Suez to India. On the 8th of February, having entered into an arrangement with the sheik or chief of a powerful tribe of Arabs, we left Cairo for Mount Sinai, with a caravan of twenty-one camels. These animals were designed for carrying our tents, provisions, and even water for our journey, as far as the head of the Gulf of Akaba, on the Red Sea, that being the boundary to which the tribe could go. Only fancy your humble servant, dressed and armed with sword and pistols, like a respectable Mussulman, and seated on a dromedary, issuing from the gates of Cairo, in the midst of a wild-looking cavalcade of camels and Arabs; and if you can, it will not make a bad sketch. Our first night's encampment in the Desert was any thing but agreeable, but the second was much worse. Before we could get up our tents, one of those dreadful storms overtook us, which are only to be seen in those latitudes—the thunder rolled and the rain fell in torrents for two hours, whilst the hurricane, I thought, would have swept every thing before it. To have had an opportunity of creeping under the belly of a camel would have been a luxury, but this was a situation I could not attain; I had to hold on by the poles of the tent, and keep a look-out after the portmanteaus and eatables, all of which, of course, were completely deluged. The night, you may be assured, was miserable enough; next day, however, the sun rose as usual in his eastern splendour, and all was forgotten;

* We are aware that at the British Association, which met in 1836, a paper was read contradictory of Decandolle's computation regarding yew trees, and stating that he made the old trees too young, and the young trees too old. The experimenter asserted that the mean average of the number of lines which a tree increased in a year, was two, or one-fifth of an inch. But Decandolle is the highest authority, and we are inclined to abide by his opinion till further experiments have been made.

and now I am so much at home in this sort of life, that it will be some time before I get reconciled to sleep within four walls. It is certainly the most independent way of living that I can imagine—no bills to pay—no waiters waiting for a gratuity—by daybreak the tents are struck, and the camels loaded, and then we are on our way for new places of interest.

In three days we crossed the Isthmus of Suez, and there being little to be seen in this miserable place, we pushed on towards the Great Desert or wilderness of Sinai. Our route here lay through the same wild mountains which were traversed by the Israelites in their flight from Egypt, leaving on our right that portion of the Red Sea which they so miraculously crossed. Near some salt springs, surrounded by a few palm-trees, and called the Wells of Moses, is the spot where it is said they crossed. The scenery through the whole of our route to Mount Sinai was of the most sublime and awful description, so much so, that I do not know what to liken it to; imagine rocks piled on rocks, such as Martin would paint, but totally destitute of all verdure, and of a dark chocolate colour, also polished so as to reflect the rays of the sun, and to scorch the face and hands of the traveller exposed to their influence—in short, a most horrid scene of desolation, and accounting for the murmuring and discontent which broke out among the unhappy Israelites whilst perishing of thirst and hunger, and reflecting on the land of plenty they had left behind them. On the night of the seventh day from leaving Suez, we made the convent of St Catherine, situated on the heights of Mount Sinai, and built on the spot where God appeared to Moses in the burning bush. This convent, situated amongst the lawless tribes of Arabs, may be called a fortress, surrounded by strong walls, along the top of which are mounted several pieces of cannon, the only access being by a rope, which is lowered from a great height in the wall, and up which you are raised by a windlass. Night had closed in long before we reached the convent; and had you seen us drawn up one by one, dangling midway between heaven and earth, whilst the Greek monks, in their picturesque costume and long beards, held a glimmering light overhead, just sufficient to light up the countenances of the wild group below, you would have agreed with me that if such a scene could have been transferred to canvass, it would have created more interest, at least in point of novelty, than any picture that has been painted in England for many a day. On landing inside, our reception by the hospitable monks was every thing that could be desired. Here we staid some days, ascending to the summit of the mountain, and visiting some of the most extraordinary scenery perhaps in the world, as respects real grandeur, and far surpassing all others in point of moral interest.

After a stay of a few days, we continued our journey through the wilderness of Sinai, riding about ten hours a-day, and encamping at night, and suffering nothing except from thirst and a scarcity of water, our supply having failed long before reaching the springs of Akaba. I enjoyed the excursion very much. Akaba is a small fortress at the extremity of the gulf of that name on the Red Sea, and is merely kept for the protection of the pilgrims that yearly leave Egypt on their way to Mekka. Here we left our friendly Arabs, and had to engage with a tribe of rather a different character. Having to wait some time until a messenger was dispatched into the mountains for the chief of the tribe that was to conduct us to Petra, I had abundance of opportunity of seeing the Bedouins 'at home.' At length, after considerable delay, and some vexation in consequence of the exorbitant charges made for the journey, our arrangements were completed, and we set out with the intent of proceeding by way of Petra to Hebron in Syria. We commenced our march, following what is supposed [and supposed erroneously] to be the ancient bed of the Jordan previous to the destruction of Sodom and Gomorrah. Thus our route continued for about a week or eight days, during which we visited the encampment of our guides. Having approached Gebel Hor, or Mount Hor, on which Aaron was buried, we struck into the mountains, in the bosom of which lies Petra, the stronghold of the ancient Idumites, which was first visited in modern times by the celebrated traveller Burckhardt, and afterwards by Messrs Irby and Mangles, also by Laborde, the only one who, except myself, as far as I am aware, has made drawings of this extraordinary city of past ages. I need hardly say that the visiting of it hitherto has been attended with the greatest difficulty, from the lawless habits of the tribes who have possession of this part of Arabia. To describe this place is impossible; therefore I will not attempt it. If I am spared to return to England, I will show you the sketches I have made, and then you will judge for yourself. Conceive a town with the most noble mansions excavated in the face of perpendicular rocks varying from five hundred to a thousand feet in height, and that to an extent of six or eight miles in all directions; the valleys or narrow ravines forming the streets, with lanes winding over from one to the other to the height I mention. The centre of the main valley had originally been occupied by houses built in the usual way, but repeated earthquakes levelled all in one common mass of ruins. There is now a city fortified by nature, such as never city was before or since, surrounded by mountains, the only passage of entrance through which is by a ravine so narrow at most places, that two camels could scarcely enter abreast. While the city was inhabited in ancient times, the hills around were cultivated to the very summit; there was a stream of delicious water flowing through it, and the population must have been immense. Now, all is desolate and solitary. The hills, though environed with a desert, still retain the richest vegetation, nature being unchangeable; but the only sound which is heard is the cry of the wild animals with which the deserted city abounds, or the stealthy step of the wild Arab, 'his hand against every man, and the hand of every man against him.' This is literally the case, for although strongly guarded, I did not complete the object of my journey without paying the common penalty of travellers. Fortunately our loss

was not great. After five days spent in making sketches of the most remarkable features of this extraordinary valley, we made the best of our way to Palestine, the most interesting of countries. Spring had now commenced, and all nature was bursting into vegetation. Waste and desolate as is the land of Judaea, nature is still as bounteous as in the days of her glory. In my wanderings through it, I have travelled from 'Dan to Beersheba,' and have never beheld nature in a more lovely form than in this once happy country, contrasted only by the utter desolation and wretchedness of her towns."

[Mr Roberts concludes by describing in brief terms his further journey to Jerusalem, the Dead Sea, Baalbeck, Tyre, and thence to St Jean d'Acre, whence, he says, he is to proceed by Malta to Spain. We trust soon to see the productions of his admirable pencil disseminated, in their usual accessible form, over the country.]

"MEMOIRS OF M. G. LEWIS,"

RECENTLY PUBLISHED.*

WE have been much more pleased than we could have expected with these memoirs of Lewis. This gentleman, as most of our readers must be aware, was a rather conspicuous member of the literary republic of Britain during the latter years of the last, and the earlier years of the present century. He was born in London on the 9th of July 1775. His father was a man of family and property, and through a long succession of years held the post of Deputy Secretary at War under various governments of George III. The mother of the novelist was the youngest daughter of Sir Thomas Sewell, Bart., Master of the Rolls. Thus respectably descended, the subject of our notice, who was the eldest of a family of two sons and two daughters, was introduced in childhood into the higher circles of society, and continued to move in them through life. In early boyhood he was sent to a preparatory school, after which he passed through the usual routine of education at Westminster and Oxford, without signalling himself very highly at any of these places, excepting by his skill in recitation and acting. While he remained at Westminster, an event took place in his family, which afterwards gave occasion, as this work amply shows, for the display of many of the best qualities of human nature on the part of young Lewis. His parents disagreed and separated, never again, as it proved, to be re-united. Dissimilarities of temper and disposition constituted the chief cause of this rupture, and it was afterwards admitted by Mrs Lewis that the principal share of blame ought justly to rest on herself. No blot, however, of a serious kind, was thrown by this occurrence upon her character. Her eldest son was deeply attached to her, and his unremitting attentions throughout the whole course of her solitary after-existence, do him a degree of honour which counterbalances in a great measure the blemishes cast upon his name and fame by other circumstances. Lewis's filial piety is here displayed for the first time to the world.

It was at the very early age of sixteen that he first attempted literary composition, and we find, from some of his letters to his mother, that it was chiefly with the view of adding to her comforts that he took up the pen. A farce or two, founded upon French pieces, and a sentimental novel, were his primary essays; but none of these productions were either accepted at the theatres, or given to the public, in their original condition. He retained them by him, however, and went on composing and projecting, so as to acquire ease in writing, and to lay up stores of manuscript for future remodelling. In 1792, he went to the Continent, and in the following year, he for the first time visited Scotland, where he chiefly lived at the houses of Lord Douglas and the Duke of Buccleugh. In the summer of 1794, his father's influence readily procured for him the post of attaché to the Dutch embassy, and accordingly he crossed over to the Hague, and passed some time there. Being still "horribly bit by the rage of writing," as he himself remarks in one of the series of letters to his mother, he dedicated his leisure hours at the Hague to the composition of a work of fiction, in the manner of the *Mysteries of Udolpho*, which he unequivocally shows his own taste by styling "one of the most interesting books ever published." Lewis's romance (the title of which gained for him the nickname of "Monk" Lewis) was written in the very short space of ten weeks, and next year, after the author had returned to England, it issued from the press in three volumes, and excited such a sensation as falls to the lot of few similar publications. Part of this celebrity, or rather notoriety, was honourable to Lewis, part of it discreditable: we willingly pass

from a painful subject to one which is only trivial. Our young author was already a clever writer of light verses, of which the following, written upon the model of a well-known trifle of Goldsmith, is a specimen:—

POOR SIMON'S MONODY.

You ask what cause my tears supplies,—
They flow because I'm weeping;
Nor e'er shall slumber close my eyes
Again, except I'm sleeping.
That I poor Simon's death lament,
No reason for surprise is;
Oh! he had been a perfect saint,
If he had had no vices.
His courage he did oft display
Where drums and cannons rattle,
And never ran from fight away,
But when he fled from battle.
He was to speak the truth inclined,
Save when he falsehoods stated;
And was a friend to all mankind,
Excepting those he hated.*

* * * * *
Yet I'm disposed, I must confess,
To think the doctors wrong here;
The true cause of his death, I guess,
Was—he could live no longer.
These tears, which all my friends deride,
I to his loss am giving—
Oh surely had not Simon died,
He would have now been living!

Immediately on becoming of age, Lewis obtained a seat in parliament for Hindon, his father being anxious that he should direct all his powers to politics. But the young man's tastes were irretrievably turned to literature, and during the year following that in which his novel was published, he startled the world anew by the production of his musical drama of "The Castle Spectre," a piece which had a run of sixty nights at Drury Lane Theatre, and which continued popular for many subsequent years. This composition showed that the style of the previous fictitious work had not been fortuitously adopted by the author, but that the ultra-romantic, the mysterious, the thrilling, and the terrible, constituted Lewis's proper field.

Between 1796 and 1800, Lewis produced "the Minister, a Tragedy from the German," "Rolla, a Tragedy from the German," "Love of Gain, a Poem," "the East Indian, a Comedy," and "Adelmorn, the Outlaw, a Drama," all of which added more or less to his reputation, and were tinged in various degrees with his known peculiarities of taste. Numerous compositions came at the same time from the pen of Lewis, which were not published. One of these, styled "the Captive, a Poetic Monodrama," is presented to the world for the first time in this Memoir. It was performed one night; but its effect on the spectators was such as to prevent its repetition, several of them being thrown into fits. It is a thrilling picture of madness, almost too dreadful even to be read.

While Lewis was thus pursuing his literary career, he continued to mix extensively with society, and became one of its first favourites. A liberal allowance from his father enabled him to maintain a fitting place in the world. He paid various visits to Scotland, residing for the most part at Inverary Castle with the noble family of Argyll, who seem to have been particularly attached to him. For one member of that ducal house, indeed, the Lady Charlotte Campbell (now Bury), Lewis entertained a feeling much stronger than mere friendship, although prudence seems to have taught him to suppress it. Inverary Castle appears to have been in those days a scene of the most refined intellectual enjoyment. Many persons of talent, some of whom now occupy conspicuous places in the world, were frequent visitors at the castle. Among other sources of amusement, a periodical paper, called the *Bugle*, was published weekly, and several manuscript copies were laid every Saturday morning on the breakfast tables. Many great names were attached to the contributions in the *Bugle*, though the most of these never were at any time set in types. Lewis was an important contributor, but many of his pieces were afterwards published, as, for example, the exquisite ballad or song of "Crazy Jane," which was suggested by a real adventure of Lady C. Campbell. Others of Lewis's minor compositions at Inverary Castle are given in these Memoirs for the first time, and we have much pleasure in laying a specimen before the reader.

THE ADIEU.

Yes! dearest girl, the time is past,
When, rural pleasures flying,
You seek the busy town, while here
I stay, in absence sighing.
But seated at some splendid show,
While all with pleasure eye you,
Oh! then on me one thought bestow,
And wish that I were nigh you.
Till summer brings thee back, my love,
Of pomp and tumult weary,
The heavy hours will slowly move,
And all be chill and dreary.
Fair spring in vain will boast her reign,
And trees their leaves recover,
While far from thee, it still must be
December with thy lover.

* There is some salt truth here. Many are friends to all mankind, except those they hate.

"The number of songs and ballads which Lewis composed," says his biographer, "must have been immense, for he wrote a very large portion of the most popular ballads of his own time." Many are still popular, and when we remember such among them as "The Banks of Allan Water," "He loves and he rides away," "Crazy Jane," "No, my love, no," and others, we cannot but be inclined to give their author a high place among the followers of the very difficult art of song-writing. To his other accomplishments he added that of musical composition; and melodies, as well as words, were in various cases his own.

Lewis met other distinguished people in Scotland besides the occupants and guests of Inverary Castle. In 1798, he saw Walter Scott at Edinburgh, and it is mentioned in the Life of the great novelist of the north, who was then but imping his poetic wings, that he (Scott) "had never felt such elation as when Lewis invited him to dine with him at his hotel." As Scott's remarks of a future date (1825) on Lewis exhibit the foibles of the latter, as well as his personal peculiarities, they may be quoted here. "Lewis was fonder of great people than he ought to have been, either as a man of talent or as a man of fashion. He had always dukes and duchesses in his mouth, and was pathetically fond of any one who had a title. You would have sworn he had been a *parvenu* of yesterday; yet he had lived all his life in good society. Mat had queerish eyes—they projected like those of some insects, and were flattish on the orbit. His person was extremely small and boyish—he was indeed the least man I ever saw, to be strictly well and neatly made. * * * He was a child, and a spoiled child, but a child of high imagination, and so he wasted himself on ghost stories and German romances." Lord Byron, who in later years knew Lewis well, alludes to his death in the following parody on two lines of Scott:—

I would give many a sugar cane
Monk Lewis were alive again.

The "sugar cane" here has reference to the scene of Lewis's decease, which occurred on the way from the West Indies, and Scott, after quoting Byron's distich, says, "I would pay my share. How few friends one has whose faults are only ridiculous! Lewis did much good by stealth, and was a most generous creature."

In the course of the first six years of the nineteenth century, Mr Lewis sustained his reputation by issuing various compositions from the stage and the press. "Alfonso, King of Castile, a Tragedy," "Tales of Wonder, in two volumes," "Bravo of Venice, from the German;" "Rugantino, a Drama;" "Adelgitha, a Tragedy;" and "Feudal Tyrants, a Romance in four volumes," are to be ascribed to this period of his career. Almost all of these productions displayed the same lively talents and the same Germanised peculiarities of taste with his earlier writings. The *Tales of Wonder*, in particular, became highly popular. To his mother the literary successes of Lewis gave extreme pleasure. The affection existing between these parties, as has been said, was most ardent and durable; and whoever peruses the letters written by Matthew to his parent, which are given in the *Memoirs* before us, and which extend over the long space of twenty-seven years, will form a very high opinion, assuredly, of the writer's goodness of heart, and also no mean estimate of his good sense—a quality less frequently attributed to him. Circumstances occurred to expose both endowments to a severe trial. About 1804, the elder Lewis became acquainted with a lady to whom he would have had his son not only stretch out the hand of amity, but pay court in the humblest manner. Having been informed of injurious language uttered by that lady against his mother, and naturally disliking her position with respect to his father, the son respectfully but firmly declined to do as desired; he would only consent to show *no ill feeling* towards the party in question. The consequence was a separation between the father and son, which lasted till the decease of the elder Lewis. The latter, however, continued the allowance on which the young author lived; and fortunate this circumstance was for the mother, as much of the son's means was expended in furnishing her with comforts which her stated allowance was too small to procure for her.

The works of Lewis between 1800 and 1812 were the "Wood Demon, a Drama," "Tales of Terror, in two volumes," "Romantic Tales, in four volumes," "Venoni, a Drama," "One o'Clock, an Opera," "Timour the Tartar, a Drama," "Rich and Poor, an Opera," and a "Collection of Poems." Various were the degrees of success attending these productions. The original spirit of Otranto-ism or Udolpho-ism—for Walpole and Radcliffe, in addition to the German, were the nurturers of his young tastes—pervaded them all, and unquestionably Lewis must share the blame, with these his models, of having fed an unhealthy and vitiated appetite in the public mind for strong excitements. Whatever was the fate of our author's productions, as far as the estimation of the critics was concerned, the poetry with which they were largely interspersed was always admired, and we cannot refrain from giving another stanza or two that are new, we believe, to the public.

THE BLIND LOVER.

'Tis true, my love, of heavenly light
These sightless orbs admit no ray;
Dark are to me the stars of night,
And blush of morn and blaze of day.

Yet think not, sweet, the want of eyes
Can e'er thine Arthur's peace destroy,
While Mary's hand that want supplies,
And kindly guides her poor blind boy.

Of when of loss of sight I speak,
I hear you breathe a tender sigh,
And oft I feel on Arthur's cheek
A tear which fell from Mary's eye:
Which when I feel—which when I hear,
Not words could yield half such a joy
As that one sigh, as that one tear,
Which pity gives the poor blind boy.

Though knowledge hides her stores from me,
And glory's clarions vainly call,
In place of these, Heaven gave me thee,
And, giving thee, it gave me all.
And while of love I hear thee tell,
And cherish hope, and promise joy,
Oh! kings and sages, sure, might well
With envy view the poor blind boy!

From the literary concerns of M. G. Lewis, we turn once more, to record the noble and honourable close of his mortal career. In 1814, he became possessor, through his father's death, of a large fortune, the major part of which lay in plantations on the island of Jamaica. After displaying the utmost beneficence to his mother, sisters, and all who had the shadow of a claim upon his bounty, Lewis, while caressed every where in society, and honoured by the intimate friendship even of princes, conceived it his duty to leave the world and its most refined enjoyments, and to take a journey, at once long and full of risk, in order to set his mind at rest respecting the happiness of his poor negro slaves. Unless one takes into account the extreme and nervous sensitiveness of Lewis's character, his delicate health and temperament, his strong attachment to his relatives, and his devotion to the pleasures of social life, the full value and merit of such a resolve cannot be appreciated. At the close of the year 1815, he embarked for the West Indies, and it is strikingly characteristic of him that he requested his mother on no account to write to him, nor to permit others to do so, dreading the effects of evil news upon his excitable constitution in such a climate. On the 10th of January following, he writes to his mother, informing her of his having had sea-sickness and misery for companions during the first month of his eight weeks' sail, but that the "opportunities afforded to him of doing some little kindness or other almost every hour of the day" after his arrival, overpaid him amply for all. His biographer thus describes the issue of Lewis's labours for the negroes. "So well did he succeed in his praiseworthy efforts, that the whole sable multitude of that part of the island began to consider him as their common friend, and the slaves on the neighbouring estates were continually making applications to him to entreat his intercession with their masters. Among his own negroes he abolished the use of the lash—gave them a fair and equal hearing with the whites in all matters of complaint—visited their cottages, and the sick in the hospital, to whom he occasionally sent the dishes from his own table. He increased their holidays, sanctioned their amusements, and became so greatly adored by the simple-hearted beings, that he could use no threat which terrified them so much, as to declare he would leave them." Having, however, determined upon a stay at that time of only four months, and finding that in that space he could not do justice to the whole of his estates, he resolved upon returning, for this very purpose, to the island, after having visited Europe. Accordingly, on the 31st of March 1816, he embarked for England, and, after a short stay there, went to Italy, in pursuance of an intention which he had for some time entertained. But the main period of this continental residence was spent in the company of Lord Byron and Percy Bysshe Shelley at Geneva; and here Lewis wrote a codicil to his will, which was witnessed by these great poets, and which made it imperative on the testator's heirs to pass three months every third year in Jamaica, that the "negroes might not be abandoned to the unlimited superintendence of any attorney or overseer." We may be assured that the two famous beings who appended their names to this document, encouraged their friend to the act by their advice and applause.

Lewis remained on the continent till the middle of 1817, when he returned to England, only to take a farewell (the last, as it proved) of his surviving parent, ere he again set out for Jamaica. Long after he had ceased to exist, a short work or journal of his was published, which fully describes the incidents of this journey. On arriving in Jamaica, after a voyage of bitter suffering, he of course went to visit those distant estates not formerly seen by him. "My estate of Hordley (says he), which had been pictured to me as a perfect paradise, I found an absolute hell; the negroes were almost frantic from the ill-usage of no less than eight petty tyrants." The property was an everlasting scene of strife and confusion. By dint of incessant personal exertion, Lewis changed the face of affairs, and when he left the spot, he was followed by numberless blessings. As for the estates formerly visited by him, he found them in so happy a condition, that he declares "he could not have believed it" on the report of others, and that he would "leave the island with a heart a thousand pounds lighter from having acquired the certainty" that he had ensured the lasting comfort of his "poor negroes."

When Mr Lewis did leave Jamaica on the 4th of May 1818, it was but to meet a sudden end. Yellow

fever appeared on board the ship before it had been a few days at sea, and Lewis was seized with the disorder. To relieve an oppressive sense of weight at his stomach, a strong emetic was imprudently given him, and from this time forward violent retchings kept him in continued agony till the morning of May 14th, when he expired. It being improper to retain the body on board, on account of the danger to other passengers and to the crew from infection, the remains of Lewis were not brought to his parent soil, in which he would have wished them to repose. On the body being consigned to the deep in a rude wooden shell, with a white hammock sheet wrapped around it, and weights attached to the whole, it happened that the weights were disengaged in the plunge, and the coffin rose to the surface, while the wind, getting between the folds of the loosened canvass, inflated it like a sail. Thus circumstanced—before the eyes of the wonder-struck passengers and crew—this coffin-bark glided away from the ship, and was soon lost to their straining gaze. Where that boat of death paused in its course, has never been learned. So strange a closing scene was not unfitting, in some respects, for the bones of one who, during life, had revelled in the mystic and the terrible.

In concluding this notice, we cannot refrain from alluding to the ungenerous remark of Byron, that "Lewis died a martyr to his new riches." If any one is not satisfied of the real state of the case from this article, let him turn to these agreeable *Memoirs*, and he will speedily be assured that Lewis fell a martyr in the sacred cause of Humanity.

A FEW STATISTICS OF CRIME IN ENGLAND. THE WRECKERS.

THE humbler class of people on the coast of Cheshire, Cornwall, and some parts of Wales, are, as respects the wrecks of vessels, as lawless and barbarous as any savage nation in Africa. They live partly by fishing and smuggling, but their principal dependence is on the plunder of vessels which have been unfortunately cast ashore. Their habits are described by all who are acquainted with them, as those of banditti; they put the civil authorities at defiance; they go in bodies together at night in quest of their prey; secrete themselves in holes and sandy hillocks on the coast as a precaution against pursuit; and in the case of wrecks being driven ashore, each seizes what he can conveniently carry, and makes his escape with it to well-known depôts of such articles up the country. Two circumstances favour this state of things—the utter inefficiency, not to call it by a worse name, of the resident civil authorities, and the insecure mode of building English merchant vessels. Our ships are knocked in pieces by a comparatively slight injury, the owners always preferring a clean wreck out and out to only a partial damage, because in the one case they are paid at once for the whole by the underwriters, while in the other they have a difficulty in recovering the amount of their loss, besides being put to a considerable degree of trouble. This is one of those "crying evils" which go on crying for centuries in this country, without ever crying exactly loud enough to force a remedy; and we only advert to it in passing, as a prevalent cause of the "wrecking system" on our coasts, not with any hope of being of service in bringing about an amendment.

The coasts of Wales and Cheshire, as being either bold and rocky, or beset with sandbanks, and lying in the line of navigation of vessels in the American trade to and from Liverpool and other ports on the west side of the island, are in the enjoyment of an extraordinary amount of casual revenue from the plunder of wrecks. Cheshire is spoken of in the Report* as a great and busy seat of the wrecking system, which is profitable not alone to the actual plunderers, but to all that part of the settled population who purchase the stolen goods, such purchases being of course effected at prices greatly below those of regular markets. A storm from the west, accompanied with rain and darkness, is hailed as the omen of a fruitful harvest; and no sooner is it ascertained that a vessel is on the rocks, than the whole clan of wreckers near the spot are on the alert, watching for the anticipated prey as it comes dashing ashore. When that melancholy consummation arrives, all rush forward, like so many vultures, on the dead and dying. The bodies of the drowned are in a moment stripped of every thing valuable, and excesses of the most odious nature sometimes ensue. One witness, in alluding to the wreck of the "Grecian," Captain Salisbury, three or four years ago, on the Cheshire coast, says, "Captain Salisbury was drowned, and when his body was found, it was stripped of every thing; and whilst on shore waiting to be conveyed to some house for holding an inquest, his finger was cut off to secure his ring. The body of a female was also washed ashore; and a woman at Moreton (a village

* First Report of the Commissioners appointed to inquire as to the best means of establishing an efficient constabulary force in the counties of England and Wales, 1830.

in the neighbourhood) was proved to have bitten off the ears to obtain the ear-rings."

Apart from these barbarities, the scramble for property on the occasion of a wreck is disgraceful in a pretendedly civilised country. Mr Dowling, the commissioner of the Liverpool police, gives the following evidence of his experience during four years' service:

"A wreck takes place on the Cheshire coast, and the wreckers, unless prevented by the assistance of the police from Liverpool, plunder and do as they please. I have frequently had occasion to go when vessels have been on the sandbanks. In some cases we have been in time to prevent depredation, where the vessel has not gone to pieces, or been near enough to the shore to have been boarded by the wreckers. But in other instances, where the property has been floating about, and the vessel gone to pieces before our arrival, we have known of large quantities of property being taken up the country—for instance, casks of rum, or, perhaps, of wine. They would knock the heads out, and men, women, and children, would bale the liquor out with kettles and pails, and every thing they could get, and carry it up the country. So with bales goods, tobacco; indeed, every thing they can make use of; and such was the feeling of the wreckers, that if a man saw a bale of goods or a barrel floating in the water, he would run almost any risk of his life to touch that article as a sort of warranty for calling it his own. It is considered such fair game, that if he could touch it, he called out to those about him, 'That is mine.' That is marked as his, and the others would consider that he had a claim to it, and would render him assistance. Such was the feeling of the wreckers when I first came here. When we have been able to get over in time, our services have been effective, and we have on one or two occasions driven them away. In some cases there have been as many as 300 or 400 persons assembled in a very short time; on other occasions 50 or 60.

On those occasions have you been obliged to resort to force?—In some cases; we have not come to actual blows, perhaps, but the police always go armed on those occasions (it would be useless going without), and they are somewhat alarmed at the appearance either of the fire-arms or the cutlasses, and they have been driven away without actual force. In other cases it has been necessary to take men into custody where the depredation has been committed before our faces, and they have been committed.

Over what extent do you generally go?—We never have gone beyond Hoy Lake—never more than seven miles.

Have you the information which enables you to speak confidently as to the occurrence of wrecks beyond that, and whether the practice of wrecking is common?—Yes, I know positively that it is. I can speak generally I know it has occurred, and I can speak most positively as to one case in particular. A vessel, called the *Hayes*, was wrecked beyond the place I mentioned, on the coast of Wales. Every thing from that wreck was taken possession of by the inhabitants of the coast, and on an agent being sent down for Lloyd's to collect what property he could, he found there was no constabulary force existing from whom he could get assistance. He applied to a magistrate, who told him that he could not assist him in any way but by making him a special constable, and letting him do it himself. I believe there was only one constable, and he was applied to to assist. He was, consequently, sworn in as special constable, and from a number of cottages he procured some quantity of valuable goods that had been taken. There is a case I will mention where an Italian vessel was wrecked upon the coast, and before my arrival there, the wreckers robbed the sailors who had escaped from the wreck, and took the clothes out of their chests before their faces on the coast. That was within the district, within the seven miles I have spoken of.

May there not be even now, before you arrive, cases of plunder?—Yes, decidedly. If a decided wreck takes place, if the vessel is sufficiently injured to form a wreck, the accumulation of wreckers is the most instantaneous thing you can imagine. They see from their residences what is likely to happen when a vessel is on the coast. They look out for it, and they are there before we can possibly get to them. It takes us some time to ascertain the fact of a vessel having struck. We are not mounted, and are obliged to hire cars on the other side of the water, and go across the country seven miles."

It appears from other evidence that the magistracy of Cheshire, and such constabulary as they have at their command, take very little pains to repress these lawless practices. In the following case, mentioned by Mr Dowling, they would almost seem to sanction them. He refers to the wrecks caused by the dreadful hurricane of the 7th of January 1839:—

"A number of the [Liverpool] police force under the command of a superintendent named Quick, who had formerly been in the metropolitan police force, were sent over to the Cheshire coast with a view of assisting in saving life and property. I think about twenty men went over. There were a number of vessels on shore, from which very valuable property had floated and been driven on shore. The wreckers, as usual, came down in great numbers; the arrival of the police of course caused them to retire. Some of them, however, to the number of twenty-five, were taken prisoners by the police; most of them were caught in the act of opening and plundering the bales and cases that floated on shore. As soon as an opportunity occurred, they were taken before the Cheshire magistrates, three of whom were assembled to meet the charges. One of the magistrates exclaimed, 'Holloa, holloa, Liverpool police here! What business have you here? You have no business here; you have no business in Cheshire; what authority have you here? you have no authority here at all; we shall have nothing to do with you; go about your business'—and that was acquiesced in by the other magistrates. A something to the same effect said. The superintendent argued, and said, 'Sir, these persons were caught in the act of plun-

dering, and I believe you will find, if you will refer to the Municipal Act, that we have, as constables of Liverpool, authority in Chester, in consequence of its being within seven miles of the borough.' 'Oh no,' was the reply, 'no such thing; it is not the fact.' Mr W—, (who is an attorney, and the magistrates' clerk), 'do you know any thing of this kind, that such is the fact?' 'Oh no, I know nothing of the kind; the Municipal Reform Act gives no such power; I know of no such power.' However, the superintendent argued the question very calmly and properly, and induced the magistrates to remand the prisoners to a future day. In the mean time, the town-clerk of Liverpool sent an extract of the act over, and on the following day, or a day or two afterwards, some portion of the prisoners were committed for trial. They felt very sore about it, but still there was something like an apology made; not exactly an apology, but they said, in a sort of sour tone, 'Well, we find you have in cases of felony some authority,' (whereas we have authority in all cases), 'but still you ought to have consulted us about it; the magistrates here ought to have been consulted as a point of courtesy. Before you come into our county you ought to have consulted us about it.' In matters of that kind we presume that all the time spent in finding a magistrate is lost, when you have no specific spot to find him in. It would be so much time thrown away where lives are in danger every moment, and property too, so that the best way is to send to the spot at once when we have authority, which we certainly had."

Similar evidence respecting the plundering propensities of the people on the coasts of Norfolk, Suffolk, Sussex, Dorsetshire, Hampshire, Devonshire, and Cornwall, are given in the volume before us. In Cornwall, though considerably repressed by the interference of the coast guard, outrages on wrecked property continue to be perpetrated on an extensive scale. In one instance described, the wreck of a vessel near Penzance, "there were 4000 or 5000 people of all classes staving in casks, drinking the liquor and wine, and plundering the property of every description—hundreds of women with pails, pots, jars, and other vessels, carrying it into the country in all directions."

A CHAPTER ON EPIGRAMS.

DR JOHNSON defines an epigram as "a short poem terminating in a point." The word is derived from the Greek language, and signifies to inscribe or write upon; hence we are to understand that epigrams derive their origin from those inscriptions placed by the ancients on their statues, temples, pillars, triumphal arches, and the like. They were very short at first, being sometimes no more than a single word; but afterwards increasing in length, they were composed in verse, that they might more easily be retained in the memory. This short and convenient method of expressing a thought or sentiment soon ceased to be confined to what was, strictly speaking, an inscription, and came at last to be used upon any occasion or subject; hence the name of epigram now-a-days has a most extensive signification. The fact is, that according to the definition given, nearly the whole of Pope's and Young's poetry, and a great part of the verse of the eighteenth century, consists of a series of epigrams neatly dovetailed into one another, and which, while together they form a harmonious whole, taken separately make good sense, and can be read with pleasure. The last century was indeed the golden age of epigram; but the latter part of the seventeenth was probably the period of our literary history most distinguished for this species of composition. The characteristics of this sort of poem ought to be brevity, beauty, and point; the latter consisting of a sharp, lively, unexpected turn of wit or thought, which concludes the piece. Such was the practice of the famous Roman epigrammatic poet Martial. The following may be taken as a specimen of this writer:—

Great Pompey's ashes Egypt's triumphs swell;
His sons in Europe and in Asia fell:
What wonder that those three so distant died?
So vast a ruin could not spread less wide.

There is sublimity as well as fancy in the last line. Others exclude the point, and require the thought to be equally diffused throughout the whole poem, which is the practice of another Roman poet, Catullus, who imitated the Greeks. There is extant a collection of Greek epigrams by several poets, under the name of *Anthologia*. These, for the most part, consist of fine thoughts expressed with delicacy, ease, and simplicity. They have nothing pungent in them; but if they do not bite, they sometimes tickle, and always please.

A copy of the first collection of epigrams that appeared in English, has lately fallen under our notice. It is above a century old, and contains so many really very clever short poems, not generally known, that we have selected some of the best for the amusement of our readers. The original, of which the following is a good imitation, although not strictly speaking a translation, is considered one of the neatest little pieces of poetry in the French language. It was addressed to Cardinal Richelieu, who, upon reading the last line,

answered very smartly, *Nothing*. Here we find the point, the wit of an epigram, like the sting of a bee, lies in its tail. Louis XIII. is the monarch referred to in the second verse:—

FROM THE FRENCH OF M. MAYNARD.
Sick of a life, possessed in vain,
I soon shall wait upon the ghost
Of our late monarch; in whose reign
None, who had merit, missed a post.
Then will I charm him with your name,
And all your glorious wonders done;
The power of France—the Spaniard's shame—
The rising honours of his son.
Grateful the royal shade will smile,
And dwell delighted on your name;
Sweetly appeased his griefs beguile,
And drown old losses in new fame.
But when he asks me in what post
I did your wished commands obey,
And how I shared your favour most—
What would you please to have me say?

The impolicy of war is happily satirised in two lines. This epigram bears a resemblance to the well-known anecdote of the lawyer, who gave an oyster shell to each of his clients, and took the fish to himself:—

THE BALANCE OF EUROPE.
Now Europe's balanced, neither side prevails,
For nothing's left in either of the scales.

We can now afford to laugh heartily at the ideas which Englishmen entertained of Scotland a century ago, and even much later. Witness Churchill's poem, "the Prophecy of Famine," and Johnson's many sarcastic remarks. Multitudes of smaller creatures also made it the butt of their clumsy ridicule. We select the following piece chiefly on account of its brevity:—

ON SCOTLAND.
Had Cain been Scot, heaven would have changed his doom,
Not forced to wander—but condemned to home.

The industry of seventy years, pursued under favouring circumstances, has, we suspect, disqualified our country, in some measure, for being a fit residence for the first murderer. The Welsh were also favourite subjects of ridicule with the Sassenach. The venom in the sting of what follows is not very virulent:—

A Welshman and an Englishman disputed,
Which of their lands maintained the greatest state;
The Englishman the Welshman quite confuted,
The Welshman yet would not let his vaunts abate.
"Ten cooks," quoth he, "in Wales, one wedding sees;"
"Ay," quoth the other, "each man toasts his cheese."

Of all the men ever blasted with poetic fire, Sir Richard Blackmore was the one most persecuted for his verses. He was absolutely like a person in the pillory; all sorts of unclean things were thrown at him by all sorts of persons. He must have been a man of the most dauntless courage, and have stood always on the very best terms with himself, else he never could have sustained such a furious bombardment of lampoons, epigrams, and all that kind of thing. The publication of his dismal epic of "King Arthur," seems to have thrown the whole herd of versifiers into a sort of phrenzy. They appear entirely at a loss for terms of abuse sufficiently gross to pelt the unhappy author with. "Prince Arthur," in ten books, was his first offence; "King Arthur" in twelve, more than doubled the provocation, and "A Satire on Wit" carried it beyond all bounds of endurance. The malignity of the wits of that day rose to a pitch of delirium unprecedented in the history of literature, and, led on by Dryden, his professed adversary, the assault was terrific. But Sir Richard did not live in a glass house. The envenomed shafts recoiled harmless from the brazen armour of self-esteem by which he was most fortunately protected. We select not the best, but the least objectionable, of the many epigrams of which he was the subject. It is well known that Blackmore was a physician:—

TO SIR RICHARD BLACKMORE.
I charge thee, knight, in great Apollo's name,
If thou'rt not dead to all reproach and shame,
Either thy rhymes or physic to disclaim.
Both are too much one feeble brain to rack;
Besides, the bard will soon undo the quack;
Such shoals of readers thy cursed fustian kills.
Thou'lt scarce leave one alive to take thy pills.

Colley Cibber was another unhappy victim of lampoon. Many were the shafts levelled at his devoted head, which was adorned with the laureate wreath of the day. That a person so utterly divested of poetical talents should have been elevated to that dignity, was certainly no ordinary provocation, but it was the reward of what was deemed great service done to government. It was the "Nonjuror," a play directed against the Jacobites, by which he acquired the place of poet laureate, and the enmity of Pope, who enthroned him monarch of the empire of Dullness in his *Dunciad*. But the other qualities of Cibber were not such as to entitle him to this "bad eminence." His comedy of the "Provoked Husband," written in conjunction with Sir John Vanburgh, will live as long as there is a stage to act it upon. From a formidable accumulation of epigrams on him, we select two:—

ON COLLEY CIBBER.
In merry old England it once was a rule,
The king had his poet and also his fool;
But now we're so frugal, I'd have you to know it,
That Cibber can serve both for fool and for poet.

AGAIN.
What different effects does the laurel produce,
In its bough there is honour, but death in its juice;
Since Cibber has humbled its honour so low,
He should taste of the juice, for abusing the bough.

It is well known why Pope gibbeted so many lites

* Henry IV.

EDINBURGH UNIVERSITY LIBRARY

rary small deer in his immortal satire : he had himself suffered in various ways from lampoons, epigrams, and libels, of every form and name. His personal defects were a broad mark ; so was his Toryism. Not content, however, with these subjects as food for ridicule, his enemies attacked him in his intellectual and moral capacity. But here he was invulnerable. The following is a specimen of the skirmishing which he sustained :—

ON MR POPE.

Pride is his pity, artifice his praise,
A mask his virtue, and his fame a blame;
Insult his charity, his friendship fear,
And nothing but his vanity sincere.

With these calumnious lines, let the following very clever poem pair off. The last verse is eminently happy :—

TO POPE.

While malice, Pope, denies thy ego
Its own celestial fire;
While critics, and while bards, in rage,
Admiring, wot admire;
While wayward pens thy worth assail,
And envious tongues decry,
These times, though many a friend bewail,
These times bewail not I.
But when the world's loud praise is thine,
And spleen no more shall blame;
When with thy Homer thou wilt shine,
In one established fame;
When none shall rail, and every lay
Devote a wreath to thee;
The day (for come it will) that day
Shall I lament to see.

The following on the same is likewise extremely clever :—

TO MR POPE.

The craven rook, and pert jack-daw,
(Though neither birds of moral kind)
Yet serve, if hinged, or stuff'd with straw,
To show us which way blows the wind.
Thus dirty knaves, or chattering fools,
Strung up by dozens in thy lay,
Teach more by half than Dennis' rules,
And point instruction every way.
With Egypt's art thy pen may strive:
One potent drop let this but shed;
And every rogue that stunk alive,
Becomes a precious mummy dead.

Pope was made of "penetrable stuff," and quivered beneath the lash of censure, however contemptible the person might be who administered it. But his friend, the Dean, was all armed in panoply of tempered steel, from which the darts cast by the small wits of Queen Anne's day rebounded like hailstones from a rock. He towered above the herd of little men in proud and solitary grandeur, and scowled down upon them in ineffable scorn, like his own Gulliver amongst the Lilliputians. However, the following was, no doubt, intended for a compliment :—

ON DEAN SWIFT'S INTENDING HIS FORTUNE TO BUILD A MADHOUSE.

To madness Swift bequeaths his whole estate;
Why should we wonder?—Swift is right in that;
For 'tis a rule, as all our lawyers know,
Men's fortune to the next of kin should go;
And 'tis as sure, unless old bards have lied,
Great wits to madness are most near allied.

A rumour to the above effect was prevalent long prior to the Dean's death. Indeed, he himself gave publicity to his intention in the witty and sarcastic effusion which he wrote on his own death. Many will recollect the following lines :—

He gave the little wealth he had
To build a house for fools and mad;
To show, by one satiric touch,
No nation wanted it so much.

Charles II. was fair game for lampooners; we select one specimen of the invective with which he was assailed. It is clever—bitter—just :—

ON CHARLES II.

Chaste, prudent, pious Charles the Second,
The miracle of thy restoration,
May like to that of quails be reckoned,
Rained on the Israelitish nation;
The wished-for blessing from heaven sent
Became their curse and punishment.

We find a great number of epigrams in which the prettiest of the thought borders on hyperbole. The following are ingenious, if not beautiful :—

ON A LADY STUNG BY A BEE.

To heal the wound a bee had made
Upon my Delia's face,
Its honey to the part she laid,
And bade me kiss the place.
Pleased, I obeyed, and from the wound
Sucked both the sweet and smart :—
The honey on my lips I found—
The sting went thro' my heart.

ON SOME SNOW THAT MELTED ON A LADY'S BREAST.

Those envious flakes came down in haste
To prove her breast less fair;
But, grieved to find themselves surpassed,
Dissolved into a tear.

FROM MARTIAL.

A drop of amber from a poplar plant,
Fell unexpected, and embalmed an ant:
The little insect we so much condemn
Is, from a worthless ant, become a gem.

The application of the above is obvious, and it probably suggested to Pope his celebrated lines on the commentators of Shakspeare and Milton :—

Pretty! in amber to observe the forms
Of hairs, or straws, or dirt, or grubs, or worms! &c.

Most fulsome was the incense of flattery offered to the superlative vanity of Sir Godfrey Kneller, the painter. The following is pretty free from that taint; and we give it, as well on account of its own intrinsic

merits, as to introduce another, containing a similar idea, but much more forcibly expressed :—

ON SIR GODFREY KNELLER DRAWING LADY HYDE'S PICTURE.

The Cyprian queen drawn by Apelles' hand,
Of perfect beauty did the pattern stand;
But then bright nymphs from every part of Greece
Did all contribute to adorn the piece:
From each a several charm the painter took,
(For no one mortal so divine could look!)
But happier Kneller, fate presents to you,
In one that finished beauty which he drew.
But oh! take heed, for vast is the design,
And madness 'twere for any hand but thine:
For mocking thunder bold Salmoeneus dies;
And 'tis as rash to imitate her eyes.

TO A PAINTER DRAWING A LADY'S PICTURE.

He! who great Jove's artill'ry aped so well,
By real thunder and true lightning fell:
How then durst thou, with equal danger, try
To counterfeit the lightning of her eye?
Painter, desist, or soon th' event will prove,
That Love's as jealous of his arms as Jove.

And with this rather-than-otherwise pleasing hyperbole, we shall close our quotations from the original "Collection of Epigrams."

* Salmoeneus.

SCRAPS FROM AMERICAN PAPERS, AS COLLECTED IN THE NEW YORK MIRROR.

WHISKERS AND LONG HAIR.

A letter from Paris states, that to be a fashionable young man in that metropolis, you must wear your hair falling in massive locks upon your shoulders—your beard must be in the style of Francis I., whilst your hand must be tightly squeezed into a canary-yellow glove; part of the costume as decidedly characteristic of an exquisite aristocrat of the present day, as a red heel was in the time of Louis XIV. Thus dressed, you may present yourself everywhere—even at the Jockey-Club, the arbiter of *fon* in Paris at the present day. Our distant readers may not be generally aware that these delectable fashions are quite as much in vogue among our Broadway dandies as they are in France. Long hair, long whiskers, and a beard *à la Francis I.* are all the rage. The derivation of this fashion of long hair is somewhat amusing. A young Parisian established himself a few years since in Cairo, in a business in which industry and perseverance would infallibly have led to competence. But our hero was impatient, and resolved to take a shorter cut to fortune. Thinking it no harm to cheat the infidels, he was in the daily practice of frauds, which, while they filled his coffers, were of little advantage to his character. At last his dishonest practices became so notorious, that the pacha was compelled to punish him in a manner in which all similar offenders had been punished in Cairo, from time immemorial. The youthful Shylock was nailed up to a pillory by the ear, and this punishment was repeated as often as his offences were discovered, until at length both his auricular organs were pierced with as many holes as a cylinder. Indeed, so obnoxious did he become at last, that the cadi, placing the gentleman's head between his knees, cut off both his ears with a razor. But the Parisian, in the meanwhile, had managed to transfer a large property to his native metropolis, and thither he followed it soon after the loss of his ears. But how should he conceal his disgrace? After much reflection he bestowed himself with half a dozen individuals suffering under a similar inconvenience, and they introduced the elf-locks, now so fashionable, and which effectually concealed their losses. Nothing could have been more fortunate. They all made excellent matrimonial speculations, and it was not until their wives undertook to comb their hair, that they discovered, to their horror, that their husbands had no ears! Our fair readers must make their own application of the moral of our story.

THE SILVER HOOK.

Doctor Franklin observing one day a hearty young fellow, whom he knew to be an extraordinary blacksmith, sitting on the wharf bobbing for little mudcats and eels, he called to him, "Ah, Tom, what a pity it is you cannot fish with a silver hook." The young man replied, "he was not able to fish with a silver hook." Some days after this, the doctor passing that way saw Tom out at the end of the wharf again, with his long pole bending over the flood. "What, Tom!" cried the doctor, "have you got the silver hook yet?" "Heaven bless you, doctor," cried the blacksmith, "I am hardly able to fish with an iron hook." "Poh! poh!" replied the doctor, "go home to your anvil, and you will make silver enough in one day to buy more and better fish than you can catch here in a month."

FRENCH GAITY.

In the campaign of 1812, a distinguished general officer of the French army was severely wounded in the leg. The surgeons on consulting declared that amputation was indispensable. The general received the intelligence with much composure. Among the persons who surrounded him he observed his valet-de-chambre, who showed by his profound grief the deep share which he took in the melancholy accident. "Why dost thou weep, Germain?" said his master, smilingly, to him; "it is a fortunate thing for thee; you will have only one boot to clean in future."

PRECOCIOUS GENIUS.

"Marm, mayn't I go and play horse to-day?" "No, child, you must stay in the house." "Now, look here, marm; if you don't let me, I'll go and catch the measles—I know a big boy that's got 'em prime!"

ACID CONTAINED IN ANTS.

Contrary to the once received doctrine that no acid was to be found in any animal, except as the effect of disease in the alimentary canal, many insects secrete peculiar and powerful ones. The fact that blue flowers, when thrown into an ant-hill, become tinged with red, has been long known; but Mr Fisher, of Sheffield, about

1670, seems to have been the first who ascertained that this effect is caused by an acid with which ants abound, and which may be obtained from them by distillation, or infusion in water. Margraff and other chemists have confirmed this discovery. The subsequent experiments of Deyeux, Fourcroy, and Vauquelin, have ascertained that this acid is not of a distinct kind, but a mixture of the *acetic* and *malic*. These acids are in such considerable quantities, and so concentrated in these animals, that, when a number of *Formica rufa* are bruised in a mortar, the vapour is so sharp that it is scarcely possible to endure it at a short distance. It also transpires from them, for they leave traces of it on the bodies over which they pass; and hence, according to the experiments of Mr Coleridge, the vulgar notion that ants cannot pass over a line of chalk is correct; the effervescence produced by the contact of the acid and the alkali being so considerable as in some degree to burn their legs. The circumstance of much of the food of ants being of a saccharine nature may account for this copious secretion of acid, the use of which is probably to defend themselves and their habitations from the attack and intrusion of their enemies.

EDUCATION OF THE PEOPLE.

It has been observed, that if the French had been an educated people, many of the atrocities of their revolution would never have happened, and I believe it. Furious mobs are composed, not of enlightened men—of men in whom the passions are dominant over the judgment, because the judgment has not been exercised, and informed, and habituated to direct the conduct. A factious declaimer can much less easily influence a number of men who acquired at school the rudiments of knowledge, and who have subsequently devoted their leisure to a mechanics' institute, than a multitude who cannot read or write, and who have never practised reasoning or considerate thought. And as the education of a people prevents political evil, it effects political good. Despotism rulers well know that knowledge is inimical to their powers.

A CAUTION TO PEDESTRIANS.

The following advice from the *Picayune* will answer as well for the meridian of New York as of New Orleans. It cannot fail to be peculiarly interesting to housewives who are particular as to the neatness of their domestic arrangements:—"It is sometimes very muddy in this city, and, therefore, some rule ought to be adopted for entering a house at such a time. The following, if not a good one, is very generally practised upon. Avoid mats and scrapers; none but people whom nobody knows use those things. The entry and stair-carpet, especially if they are very costly, will get a good deal of mud off your boots by the time you reach the drawing-room, particularly if you dig your feet well into them every step you go, which you ought to do; because it makes people think that rich carpets are every-day things to you at home. And should any mud still stick to your boots after you have reached the drawing-room, you may easily get rid of it upon the hearth-rug, by a little dexterity in handling your legs while forking your locks before the chimney-glass."

SAVING TIME.

A clergyman who had considerable of a farm, as was generally the case in our forefathers' days, went out to see one of his labourers, who was ploughing in the field, and he found him sitting upon his plough, resting his team. "John," said he, "would it not be a good plan for you to have a stub scythe here, and be hubbing a few bushes while the oxen are resting?" John, with a countenance which might have well become the divine himself, instantly returned, "Would it not be well, sir, for you to have a swinging-board in the pulpit, and when they are singing, to swingle a little flax?" The reverend gentleman turned on his heel, laughed heartily, and said no more about hubbing bushes.

A BUSY FELLOW.

The *New Era* says there is an editor down east who is not only his own compositor, pressman, and devil, but keeps a tavern, is village schoolmaster, captain in the militia, mends his own boots and shoes, makes patent Brandreth pills, peddles essences and tin-ware two days in the week, and always reads sermons on the Sabbath, when the minister happens to be missing. In addition to all this, he has a wife and sixteen children. The *Boston Morning Post* says this is not all—he owns a schooner, and came to Boston with a cargo of potatoes and onions, last fall, raised by himself, and gave notice to his subscribers, when he left, that the issuing of the next number of his paper would depend upon the wind—atmospherical and financial, we suppose.

WILLIAM TELL OUTDONE.

In Northern Pennsylvania, some time since, a feat was performed in Ridgely, Bradford county, which throws that of William Tell in the shade. A man named Lathrop Baldwin, with a rifle, shot an apple from the head of Thomas Fox, at eighteen yards' distance, arm's length. There was no cap on Fox's head; his hair was combed down smooth, and the apple was a small one. Both were somewhat in their cups.

To prevent misapprehension, it is again respectfully stated, that all articles in *CHAMBERS'S EDINBURGH JOURNAL*, which bear no mark of quotation at beginning or end, are original.

No communications in verse or prose are wanted. For the preservation or return of papers sent in contravention of this announcement, the editors do not hold themselves responsible.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all book-sellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the *Journal* are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

PRICE THREE HALFPENCE.

RISE OF MANUFACTURES IN LITTLE TOWNS.

ALMOST all the great seats of manufacture were, at no distant period, little towns. For ages, these little towns had slumbered in rural peace and stagnation, when at length some lucky accident set them off in a career of industry, never afterwards to be stopped. Such were Liverpool, Manchester, and Birmingham, amongst our neighbours; such Glasgow, Paisley, and Dundee, amongst ourselves. It is curious to observe how the beginning was made. Sometimes it was situation near water-power, or coal, or workable ore; sometimes it was the innate or awakened spirit of industry in a few individuals, or one only. Sometimes causes of both sorts operated. We look upon the springing up of a man of active intellect in some dull little village or town—the struggles of that man with local and other difficulties—his successes—the other exertions made in consequence of his example, until the place becomes a noted seat of manufacture—as all of them circumstances of such interest, that, could a minute detail of them be in any instance given, we believe the result could not fail to be one of the most interesting of books. And this interest Hutton's account of the rise of Birmingham has in a great degree. It is still more interesting, however, to behold with one's own eyes, or hear of as going on at no great distance, in some place recently or still an obscure village, the first difficult, but therefore all the more meritorious efforts, which are yet perhaps to confer fame and wealth, and a larger measure of all common human comforts, on that particular spot of the earth. We recollect having thus had our sympathies much interested, a few years ago, on visiting the retired village of Earlston in Berwickshire, in hearing of two females named Whale, who had set one or two looms a-going for the fabrication of gingham—an article never before woven in that district—and who had already been so successful in producing a strong, well-coloured, and every way suitable article, that their name was beginning to be favourably known, their trade was extending, and they were already the most important persons about the place. Since then, "Earlston gingham" have become ticketed in almost every mercer's window in the Scottish capital, and probably in other places; and the Misses Whale have become the heads of a factory, which employs a large section of the population of the village. It is by no means unlikely that, from this beginning, made by two unpretending, industrious women, Earlston may go on in constantly increasing manufacturing energy, until it becomes a town of some note. What makes the merit of the beginners in this case the more striking, is, that so many other towns, larger and smaller, in the same district, continue indolent and indigent, as Earlston itself was not long ago. Those must surely be no common persons who have done what is done by so few and in so few places.

There are two or three other towns in the south of Scotland which have started, in this manner, from the sleep which rests upon most of them—Hawick, for instance, and Galashiels. The industry of these towns is of about seventy or eighty years' standing. We cannot trace its origin, and know little of its history; but one surprising fact is obvious, that, having once got the industrious stimulus, these towns have gone on extending and enriching themselves, while towns only a few miles distant, as advantageously situated in all respects, have continued to sleep and tittle away their time, so as to be now not in the slightest degree better than they were fifty years ago. The locality of an industrious spirit is thus brought strongly before us. Visit one town, and you find all enlightened, active, frugal, and thriving—go across a

hill or a valley to another, and there you see the whole tribe lounging in streets that seem to realise the desolation predicted for the Scottish burghs at the union by Lord Belhaven—doing nothing, thinking of nothing, hopeless, utterly apathetic.

Galashiels, as one of the few awakened towns of a district generally rural and inactive, may be considered as not unworthy of some notice. It is a town of about three thousand inhabitants, situated on the banks of the song-famed Gala-water, about thirty miles from Edinburgh, and four from Melrose, having the Tweed running at no great distance from it, while pastoral hills rise in all directions round about, and seem to shut it up from all the rest of the world. Originally it was a little village connected with the barony of Gala, and only three or four years ago (if not to this day) there were people living who remembered since every house in the present town was built. About sixty years ago, a trade in the dyeing and spinning of wool was carried on by some of the denizens of Galashiels, and, indeed, had probably been carried on for some previous years. But the scale on which this was done was extremely limited. The dyers and spinners of those days contented themselves with taking in the little wool-stock of each of the farmer's wives around, and of the rural population generally, which wool they dyed and got spun by the hands of women employed for the purpose. Of course the common spinning wheel was the only machine then in use. A journey on these matters from farm-house to farm-house constituted the whole of the travelling performed by the early manufacturers, of whom the town numbered only two or three. About fifty years ago, *spinning-jennies* were introduced into Galashiels from England, where they had already come into extensive use. A family of the name of Mercer were the introducers of the new machine, and the factory which belonged to them is still standing on Wilder or Wild-deer Haugh, a haugh or plain near the town. The new machine had thirty spindles on it, and was of a comparatively imperfect order, worked only by men's hands. In spite of such defects, which were only such as all recent inventions are liable to, the introduction of several of these spinning-jennies added greatly to the manufactured produce of Galashiels, and the town acquired by degrees a fixed and extensive repute for a species of strong and coarse cloth for country wearing, which went by the names of Galashiels grey, and Galashiels blue. The weaving was executed by hand-loom, and, one way and another, what with dyeing, weaving, and spinning, a considerable number of hands were employed in the trade, and it became the staple business and support of the town. As may be supposed, the manufacturers no longer confined their purchases to the wool-gatherings of the old dames of the country, but went to the wool-markets of all the neighbouring districts, and bought largely from the sheep-farmers.

Although several different factories, of no trifling size, had been previously built and established, and although the trade in blues and greys had grown extensive and important, it is not more than twenty-two or twenty-three years since water-power was first applied in Galashiels to the driving of the spinning-machines. The carding-machines, or those which prepare the wool for spinning, had been for many years driven by water, but not so with the spinning machinery. The application of the water-power to this purpose was an improvement of great value and consequence to the factories. Having all their carding and spinning, two of the most material processes in their manufacture, executed by water—with the aid, of course, more or less, of human hands—the traders of Galashiels have gone on with increasing spirit and

success from that time forward, extending the range of their labours and their produce, and availing themselves of all the mechanical improvements of the time, whether foreign or domestic. At the present moment they have reached a high state of prosperity. There are now ten factories in the town, eight of which are situated on a single mill-course, taken from the south side of Gala water, and appropriating (in summer, at least) nearly the whole contents of the stream. The remaining two factories are upon the north bank of the Gala. One of these is worked by a small dam of its own, while the other, an establishment erected very recently, is worked by a steam-engine. The number of persons employed in these factories, and in task-work connected with them, cannot be much less than a half of the whole population of the town. An intelligent member of the manufacturing body of Galashiels estimates the value of the wool brought into the town in each of the last two or three years, at about L.30,000. As the produced goods are usually calculated to double the raw material in value, on a general average, the Galashiels factories will have issued annually for some time about L.60,000 worth of goods of various kinds. This computation is of necessity a rough and general one, but it approaches near to the truth, and unquestionably falls rather below than above the mark. The nature of the articles manufactured in the town has undergone a great change of late years. In place of the cloths called Galashiels greys and blues, the chief produce recently has consisted of shawls, tartans, and fancy articles of various kinds, the trade being still all in wool. Only two out of the ten factories continue the regular manufacture of cloths. This change in the character of the produce has been accompanied by a corresponding alteration in the material employed. Very little home wool, comparatively, is now used in Galashiels, Australian and other foreign wools having come in its place.* The greater fineness of the goods now manufactured seems to be the principal reason for employing these wools in preference to those of our own country.

To those who keep in view the manufactures of Paisley and Glasgow, an annual produce of L.60,000 in value may appear something very insignificant. But, in making such comparisons, the recent origin of the Galashiels trade, the small size of the town, its distance from sea-port aid and encouragement, and many similar circumstances, ought to be taken into account. Considering these things, its trading career is wonderful. Only four years back from the present time, the manufacturing produce of Galashiels must have been less by nearly one-half than it now is, seeing that within the last four years the number of sets of carding-machines in the town has been increased from ten to twenty, or exactly doubled. These carding-machines prepare the wool, by thoroughly teasing and mixing it, for being spun by the jennies or the mules; and, of course, the quantity carded in some measure indicates the quantity spun, and the quantity of the produce. But besides this increase of machinery, there are many other proofs and tests of the extraordinary and successful progress of the spirit of enterprise within these few years. The aspect of the place announces the fact at once to the stranger. Instead of the single old street, so frequently constituting other rural Scottish towns, with its darkened and uneven line of houses, not one of which presents the enlivening appearance of stone fresh from the quarry, Galashiels

* In 1774, only 722 stones of wool were used in Galashiels by the cloth-makers; in 1790, the quantity was 2916 stones; in 1833, it had reached 21,500 stones, of which only 500 were foreign.—*New Statistical Account of Scotland*. The increase of foreign wool since 1832 is very remarkable.

now exhibits the spectacle of numerous half-completed and newly-completed dwellings, scattered in all directions, and forming either a portion of some lately begun line of houses, or possessing the character of isolated cottages. On one spot alone in the precincts of the town, where the visitor six years ago could not have seen a single house, he may now behold nearly twenty, with a very handsome chapel of ease in the centre of them.

Glasgow is the principal market for the manufacturing produce of Galashiels, although its shawls and fancy goods, some of which are now wrought in an unusually tasteful style, find their way every where. When trade is very brisk, purchasers will come to the doors of the rural manufacturers, but in general the latter travel more or less frequently to the west country to dispose of their goods. Being thus brought into frequent intercourse with the world, the Galashiels manufacturers acquire a degree of intelligence not usually found in mercantile men residing in rural districts. Moreover, machinery has an effect, it appears to us, in sharpening the intellects of all whom circumstances bring into contact with it, and our country manufacturers have benefited, certainly, by this peculiar influence. Their workmen, also, by the same reasoning, ought to have tasted of the improving influence, and they are undeniably intelligent men in the main. They receive good wages, and those, in particular, who are active and skilful weavers, can make decidedly large weekly earnings.

How this detail is to strike the minds of our readers, we of course cannot tell; but we know well that to our own minds it affords matter of the most pleasing consideration. Here is a little hive of human beings, all enjoying a fair share of ordinary comforts, on a spot where not many years ago dwelt only a few simple rustics. And all this has been brought about in consequence, in the first instance, of the industry and prudently conducted enterprise of a few superior minds out of the original population. Verily, if he who makes two blades of grass grow where only one did before is to be esteemed as a benefactor to his country, we may well regard with admiration and praise the men who have made three thousand people happy where formerly there were not as many scores. It is just this thickening of the population of the earth's surface that marks the advance from barbarism to refinement: the unsettled parts of North America have not one inhabitant for every square mile, while the Netherlands have two hundred and fifty, and each of these two hundred and fifty, two hundred and fifty times better off. Nor has the end yet been reached. This humble Roxburghshire village has as yet only got over the early difficulties of its career. It will probably become ere long a large and important seat of its peculiar manufacture.

When we contemplate such histories as this, it is impossible to resist the belief that many others of the stagnant little towns throughout the country might be in like manner set forward in an industrious career. In all of these places the amount of poverty is startling. We lately alluded to one, in which the third of the population was shown to be in a state liable to charitable relief. Even the better class of people in such places are poor; but how can it be otherwise, when they do so little! Their life is generally a life of nearly complete idleness, for, though they may have shops open, the small amount of their custom makes business in their case only an appearance. Ten mercers, perhaps, are dividing what would only be fair business for two or three; and thus seven or eight persons in ten may be said to be mispending their time. They pathetically show that business in such a field cannot be pushed—that they can only get what comes; but why should they wait at all for what comes in such dribbles? Obviously, they should either go to some more industrious scene, or endeavour to make a scene of industry out of their present situation.

It is of course impossible for us to give more than a few general hints as to the introduction of industrious operations into idle towns. Country gentlemen, partly under benevolent and partly from interested motives, sometimes make efforts to introduce manufactures into rural scenes. Associations of individuals occasionally endeavour to lay out capital to advantage in the same way. These, we suspect, are not the best means of effecting the end. We are disposed to hope for more from the exertion of native ingenuity, native industry, and native enterprise, however small the beginnings may be; and this simply from the great principle, that, in all human affairs, the natural energies of the persons concerned are of still more consequence than the pecuniary means. With ingenuity, industry, and enterprise, something may be done, but without these, nothing; and that large sums may be unattended in their expenditure by such qualities, is only too clear. Possessing such qualities, some native might, we think, in most cases be able to select some one of the many tasks of industry, which might be found suitable to local circumstances, and capable of being carried on with profit. Generally, there is a great tendency to adopt some one of the more conspicuous kinds of manufacture, just as there is a tendency amongst educated young men to go into one of the three leading professions, all of which are overstocked, and ever will be, by reason of their very conspicuousness. These manufactures are generally fixed on a large scale in certain districts, where they are carried on under such advantages that a new place has little chance in competition. We would hope

more from an attempt to establish some one of the obscure kinds of manufacture, or at least some subordinate department of the larger. A certain originality is necessary in these matters, as it is in those who would distinguish themselves in literature, music, or imitative art. Such an originality we conceive to belong to the case of the Misses Whale at Earlston: *ginghams* was a clever and a happy thought. For want of such inventive thought in the provinces, it sometimes happens that a manufacture is carried on in large places, though not suitable there, instead of the lesser places, to which it would be suitable. For instance, as we are informed by Dr Ure, in his late work, the manufacture of catgut is chiefly carried on in London, although the fatness of the sheep killed there renders the intestines so unsuitable, that British strings never bring so good a price as foreign ones, which are made from the offal of comparatively lean mutton. Now, assuredly the mutton killed in some parts of Scotland is lean enough, and we cannot see what but an inventive genius has been wanting amongst us for the establishment of a manufacture of those strings, which do so much to cheer the lady's drawing-room as well as the peasant's fireside. It may so be that this particular manufacture would not be found suitable anywhere; but yet it seems exactly such a thing as a vigorous and enterprising mind in some nook of the country might afterwards be found to have cogitated, tried, and ultimately carried on with success. How many other articles of commerce which are at present largely imported from foreign countries might be made with advantage in our own, it would be out of place to speculate upon; we need only recommend the official lists of importations to the careful consideration of those active-minded individuals who are looking out for objects on which their industry may be profitably exerted.*

REMINISCENCES OF LUBECK.

"How are the mighty fallen!" is a thought which naturally suggests itself to the stranger, who for the first time visits the ancient town of Lubeck. Situated on a ridge between the rivers Trave and Wacknitz, which, a few miles farther on, flow into the Baltic, she was at one time the chief city of the Hanseatic League.† For four centuries she retained this proud pre-eminence; the seat of the government of the Confederation, the repository of its archives, and the station of its fleet, to the command of which she was entitled to appoint one of her citizens. The League was at length dissolved, and her importance diminished, while her commerce decayed. She has dwindled into a state of comparative insignificance; the grass grows on many of her once crowded streets, and not a few of her palaces are empty. In external appearance the buildings of the town have undergone little change since the fifteenth century. The houses are still distinguished by their quaint gables, and often by the splendour of their architecture. The feudal gates, the Gothic churches, and the venerable Rauthhaus (senate-house), all speak of that period of prosperity, when, as an imperial free city, and the Queen of the League, she deserved the name of the "Carthage of the North."

To this monument of fallen greatness I bent my steps some years ago. My fate had been not unlike that of the capital of the Hanseatic League. The impoverished widow of one of England's proudest merchants, I came to Lubeck with my two orphan children, in the hope that the deformity of my eldest boy might be cured by one of her medical men who has long been famous all over Germany for the extraordinary success that has attended his efforts in the removal of every species of deformity. The house inhabited by the learned and skilful doctor is situated in a quiet street. The style in which it is fitted up, assimilates it to a fairy palace. Nothing meets the eye that is not calculated to convey pleasure to the senses, with the exception of boys and girls labouring under every species of deformity. And even this distressing exhibition of the "ills that flesh is heir to," is made almost pleasing, by the innumerable elegant contrivances for suiting each individual case of malformation. The children are at work or at play—happiness depicted on every countenance—while they sit, recline, or lie on couches, according as the nature of their complaint requires. None are admitted under six years old. My boy was seven; and after a fortnight's care-

ful consideration of the case, the doctor admitted him in the almost certain hope of curing what in England had been considered hopeless—a prognostication which, at the end of two years, was happily fulfilled. I took a house in the immediate neighbourhood, and saw my little Lewis frequently. He was at first very sorry to part with "dear, dear Mamma," his brother Frank, and good kind nurse Martha; but a few days more than reconciled him to the change. Every thing that the most admirable skill could devise, and the tenderest care could execute, was done for my happy boy.

I lived economically, and mingled little in society. The board paid for Lewis was about £120 annually, the moderate sum charged by the doctor for patients of every rank; and the children of princes had been under his care: but still I found it a heavy sum for my diminished fortunes. I was discontented; I was unhappy. I repined at the loss of my husband and ample revenues. I regarded lightly the rich blessings that were still mine; and it was necessary that more afflictions should beset me before I should attain complete resignation.

My youngest boy, my beautiful Frank, sickened—the hand of death was on him—and I, a lonely widow, in a foreign land, was in the depth of despair. One morning, nurse Martha begged that I would allow her to ask the good lady who lived opposite, and who was so regular in her inquiries after the sick child, to visit me. On inquiry, I found Madame Von der Hausen was a widow, whose sole occupation seemed to be, to do good. "But," said I to Martha, "this lady is a stranger to me, and I to her; I have no claim on her good offices. Alas, alas!" I continued, "I have no friend in this foreign land!" "That is just the reason, my dear mistress," said Martha, "why you might be the better of seeing Madame Von der Hausen. Every body speaks of her in such a way that I never see her without thinking that she might well say of herself what the patriarch Job said of himself, 'When the ear heard me, then it blessed me, and when the eye saw me, it gave witness to me, because I delivered the poor that cried, and the fatherless, and him that had none to help him.' My dear lady, do let me ask her to visit you." I shook my head, and said nothing. So Martha supposed she might venture to ask Madame Von der Hausen to visit her miserable mistress.

That evening I heard a gentle tap at the door, and, supposing it was Martha, I called, "Come in." The door opened, and the most prepossessing-looking elderly lady I ever saw, entered. "You will excuse my intrusion, my dear madam," she said; "but your faithful servant assures me I can be useful to you, and I am only studying my own happiness when I say, command my services." I thanked her, and apologised for my servant's forwardness; but she would listen to no apology. "Martha did right," she said; "nay, she had done her honour, in believing her to be willing to serve one who was a stranger and in affliction."

The favourable impression made on me by her first appearance, increased at every succeeding interview. She assisted me in nursing my dying boy, who lived three weeks after I first saw her. He became very fond of her, and would lay his aching head on her shoulder very contentedly, while I tried, and generally tried in vain, to court a few hours' sleep. He died in her arms, while I lay swooning on the floor, unable to witness his last agonies. A succession of fainting fits, followed by a serious illness, prevented me from taking any charge of the funeral of my beloved boy. Madame Von der Hausen superintended every thing. She nursed me during my illness with a mother's care. She tried to soothe me, and speak comfort to my wounded spirit; but I would not be comforted. I mourned for my lost one. I said I should never know a moment's happiness again. "Speak not thus, my dear friend," said Madame Von der Hausen; "I hope and trust the sufferings you have undergone will be the means of leading you to the enjoyment of a happiness far beyond any you have yet tasted." I looked at her in astonishment; I did not then understand the meaning of her words.

When I began to recover strength, I longed to see the grave where my boy rested. Madame Von der Hausen promised to accompany me thither as soon as I was able to make the effort. Accordingly, one beautiful day in July 1836, we bent our steps to a cemetery outside the walls. Nature had put on her robes of gladness, and I felt as if she mocked my misery. I longed for the thunder-cloud, the pelting rain, the howling wind, as things that would be more in unison with my despair. But the sun shone brightly, and the light summer air gently ruffled the leaves of the shrubs that ornamented the burying-ground. Madame Von der Hausen led my steps towards a small monument of white marble. Inscribed on it I read, "Here lie the mortal remains of Frank Perceval, aged 4 years. He had lost his Father on earth; he has found his Father in Heaven." A fresh wreath of flowers hung on the monument. I looked at my friend; it was she who had done all this. I flung myself into her arms, and wept my boundless gratitude on her bosom. She had at last found a chord in my heart that responded to her touch; and she took advantage of it, until she led me, step by step, to trace in all my misfortunes the working of a gracious providence, and at length to acknowledge in adoring gratitude, "He hath done all things well." The history of her own eventful life was that which affected me most deeply, and, indeed, the incidents I have mentioned regarding myself were only

* With the view of aiding in the good cause of national industry, we shall, at the earliest convenience, give a list of the chief imported articles, not requiring a peculiar climate for their production.

† The Hanseatic League was an union amongst the principal towns of northern Europe, first formed in the thirteenth century, for the purpose of protecting their commerce from the pirates and robbers by which sea and land were then infested, but which afterwards became a great commercial monopoly, and acquired so much strength as to exercise no small political influence in Europe. It conquered and deposed several monarchs, and, under favour of its enormous power, a burgomaster of Dantzic once declared war against the king of Denmark! This great confederacy was dissolved in the year 1640, but some remains of it may still be traced in the independence of the four free cities of Germany, Lubeck, Hamburg, Bremen, and Frankfort.—Ed.

intended to introduce more regularly my dear friend's history.

At the beginning of the present century, she had been left a widow with an only son. About the time the French overran Germany, he had attained his nineteenth year. Heir of a noble fortune, it was thought advisable he should marry early, and he had been solemnly betrothed to a young and beautiful lady to whom he was fondly attached. In Germany the betrothal takes place a year before the marriage. The young couple spend as much as possible of the intervening time in each other's society. Six happy months had passed over the heads of these young lovers, when the war tocsin was sounded, and the men of Lubeck were called on to fight for their fatherland. As readily as the Highlanders of old obeyed the signal of the fiery cross, did the Lubeckers form themselves into a regiment. The ladies embroidered the regimental colours, and presented them to the gallant corps, who swore no enemy should ever gain possession of them; and Heinrich bade adieu to his Amelia with the mingled feelings of a despairing lover, and an ardent soldier burning to avenge his country's wrongs.

Every one is more or less familiar with the events of the German war. After the fatal defeat of Jena in 1806, Blücher, retreating with the wreck of the Prussian army, and hotly pursued by Bernadotte, Soult, and Murat, threw himself into Lubeck, in spite of the remonstrances of the senate and the citizens, and thereby involved it in his own ruin. Not more than a third of the original Lubeck regiment returned with Prince Blücher. Among the survivors was Heinrich, worn and wasted to a shadow with danger and toil.

Anxiety and suspense had wrought their usual effects on Madame Von der Hausen and Amelia. The lovers met; but under what different circumstances had they once anticipated a meeting! They met but to part for ever. The French had followed hard on the retreating Prussians. The battle commenced outside the walls. The town was stormed. The Prussians fought in the streets, but at last were compelled to evacuate the town, which was sacked and pillaged, and for three dreadful days given over to the tender mercies of a brutal soldiery. More than thirty years have passed since those fearful days, but even yet, no one speaks of them but to an intimate friend, and the voice on such occasions sinks to a low whisper of shame and horror.

In the streets of his native city, at the very door of the house where he had hoped to dwell with his young and lovely bride, Heinrich fell covered with wounds. The family had taken refuge in the cellars, but in a moment of agony Amelia had rushed up stairs, and, looking from a window, saw her lover fall. Her shrieks attracted the notice of the soldiery; they broke into the house: a few days after, she died a raving maniac in the arms of Madame Von der Hausen. For some time after this, Madame Von der Hausen was a prey to hopeless misery. One of her favourite haunts was the church called the Marienkirche, a brick building in the Gothic style, finished before the year 1144, and displaying much elegance in its architectural decorations. But what attracted her was a painting of the Dance of Death, attributed by some to Holbein, but in reality executed several years before the birth of that great artist. Here she would remain for hours, apparently taking a gloomy pleasure in the various scenes depicted by the artist, where death seizes men in the midst of security and apparent happiness.

One day when about to leave this spot, she was addressed by an old Lutheran clergyman. "Madame Von der Hausen," he said, "this picture seems to attract much of your attention, and yet, methinks, there is a picture in one of the side-chapels of the Dom Kirche, which might be to you a source of more genuine satisfaction." Thus saying, he left her. She pondered on his words, and next day bent her steps to the cathedral in search of the picture.

The side-chapels contain the monuments of many of the patrician families of Lubeck, and the tombs of numerous bishops and canons are in the choir. The remains of the Dukes of Oldenburg repose in immense coffins of white marble. The mother of Madame Von der Hausen belonged to a branch of that princely family, and she lingered long beside their tombs, feeling as if the dead were more to her than the living. In a chapel behind the high altar is a very remarkable painting, bearing the date 1491. It is placed in a shrine. On the outside of the folding-doors, there is a picture of the Annunciation. Inside of them are figures of St John the Baptist, St Jerome, St Blaize, and St Philip, but the central and principal picture is a representation of the events of the Passion, depicted in twenty-three distinct groups. Towards this picture Madame Von der Hausen directed her steps. Each individual countenance is a study in itself. She gazed on the face of Simon the Cyrenian, in which there was a moral beauty that riveted her attention. She was next attracted by the wild grief of Mary Magdalene; her head thrown back, her beautiful hair hanging in disorder round her shoulders, and her hands extended forwards as she wrung them in despair. By and bye, her eye rested on another figure: it was the Virgin mother, seated at the foot of the cross. The calmness of her agony struck forcibly on the heart of the bereaved mother. The view of the principal figure completed the impression, and Madame Von der Hausen left the place in a

very different frame of mind from that with which she had entered it. I will not dwell minutely on the change which she now experienced; it is sufficient to state the result. Her distress was exchanged for a state of complete tranquillity, and henceforward her time was chiefly occupied in visiting the afflicted, soothing the mourners, and relieving the distressed.

Objects were not wanting on whom to bestow her sympathies. For several years the French kept possession of the town, and their cruelty and rapacity caused much individual misery. Their very presence was torture to multitudes on whom they had brought disgrace and ruin. Towards the end of the Moscow campaign, they evacuated the town, amidst the curses, not loud but deep, of the oppressed inhabitants. The Russians came, and were hailed as friends; but, alas! they were found to be locusts, "for they ate up the residue that had escaped" of the former plagues. If they got a silver fork or spoon to eat with, it was immediately transferred to their pockets, and was no more seen! The filthiness of their habits exceeded all that can be imagined: more than one gentleman burned his house after they had left it, hopeless of cleaning it by any other means. Years glided on, and Madame Von der Hausen continued her course of practical benevolence. Great part of her ample fortune still remained, having, by the help of a kind friend, been preserved from French exactions. She did, indeed, deserve all that nurse Martha had said in her praises. There is an old church in Lubeck, the interior of which is fitted up for a poor's house. There are two long double rows of cabins, very much like those sometimes seen on the deck of a steam-boat; on one side, the cabins are occupied by females, those on the other side of the church by males. Here Madame Von der Hausen was in the habit of taking me; and while listening to the melancholy history of many of the occupants, I learned to feel that others had drunk at least as deeply of the cup of sorrow as I had done, and that in many cases it had proved ultimately a blessing.

In the beginning of 1838, my eldest boy Lewis was perfectly restored. The lump which had threatened to disfigure his back had altogether disappeared, and a limb which had shown a tendency to shrink was strong and hale as the other. I thought of leaving Lubeck and returning to England, but to part with Madame Von der Hausen was very painful to me. Her health seemed failing; the winter had been peculiarly severe, and she often looked as if she would not long inhabit the earth. April was approaching, and it was just twenty-five years since the French had left Lubeck. The Germans attach some importance to certain periods of time. For instance, if a couple attain the twenty-fifth anniversary of their marriage, a splendid entertainment is given; all their friends make them presents, and the fête is called "the silver day." But if, as rarely happens, they attain the fiftieth anniversary, it is celebrated with much more pomp: the couple are remarried, and the presents given are more handsome and numerous. This is called "the golden day." But this is a digression. The people of Lubeck resolved to celebrate the twenty-fifth anniversary of French leave-taking, and great was the sensation created. On the morning of the Sunday, the town was crowded; multitudes came from the country, and even from Hamburg, though distant nearly forty English miles. At an early hour, all those assembled who had fought in the war of freedom, and marched, followed by the military, to the Cathedral or Dom Kirche, where the service was performed by a clergyman who had also fought in the war. When service was ended, the colours which had been embroidered and presented by the ladies of Lubeck at the beginning of the war, were produced. Faded and worn, like the hopes of those who had ornamented them, they presented a spectacle which recalled many a melancholy scene. Four only of those ladies were alive, among whom was Madame Von der Hausen; these four stepped forward, and crowned the torn and tattered colours with laurel. The warriors with their relations and friends left the church. The gentlemen afterwards dined together. Meantime, the young men of Lubeck had associated themselves together, and went in a body to the hotel where the warriors dined, to testify their respect for those who had fought their country's battles. One of them came forward, and in the name of the rest, made an eloquent speech on the occasion, ending with the hope, that should their fatherland again become the prey of the invader, they might be found as ready and willing as their fathers had been to draw the sword, and die or conquer in her cause. The whole then formed a procession, and marched through the town, which was splendidly illuminated, and each carried in his hand a blazing torch.

All day, my dear friend Madame Von der Hausen had been much excited, far too much for her weak frame, yet she insisted on going to the market-place, where all were to meet before dispersing. And here I would remark the melancholy difference between the habits of a German population, and those of our own countrymen, who pride themselves on their superior morality. Not a sound of riot was heard; not a drunken individual was to be seen; and Madame Von der Hausen and I walked through the crowded streets with the most perfect propriety and safety. We reached the market-place; the procession approached; the vast square was crowded with thousands; when from the assembled multitude there arose the grandest,

the most sublime song of praise human lips ever uttered, the *Te Deum Laudamus*.

As they sang the last words, "Oh Lord, in thee have I trusted; let me never be confounded," I felt my friend lean heavily on my arm; she had fainted. The men were piling their blazing torches into heaps; but at last I got assistance, and had her conveyed home. She died in my arms that night.

NAMES OF RIVERS.

WHILE the various nations of Europe and Asia are distinguished from each other by many peculiarities of external aspect, manners, and, more than all, of language, it is surprising to find that some appellatives of natural objects, and particularly of rivers, prevail in many countries, as if the inhabitants of the earth had at some time been less diversified, at least in respect of language, than at present, or at any time within the scope of history. We shall adduce some of the more remarkable instances of common or nearly similar names of rivers which are to be found throughout the elder world.

The sounds *ou*, *sk*, and *z*, occur in the names of many rivers. In England there are three rivers named Ouse—respectively in Yorkshire, Norfolk, and Sussex. In Scotland there is a stream named the Ewes. The Oise occurs in Holland, and there is a much more remarkable river of the same name in France. There is also an Ousa in Siberia, and an Owzen in Russia. At Oxford we have the Isis, and in Lower Saxony we have the Ise—evidently a modification of the same word. Then, again, with respect to the sound *sk*, we have five Esk in Scotland, namely, two in Kincardineshire, two in Edinburghshire, and one in Dumfriesshire. In Wales we have the Usk, and in Yorkshire the Wiske. In Franconia, now a part of Bavaria, there is the Aisch; and in Turkey there is the Esker (anciently Oeskus). An Uska flows into the Dniester in Southern Russia. In Devonshire there is an Ex, from which come the names of the towns Exeter and Exmouth. In the same county there is an Ax, on which is situated Axminster; and in Somersetshire there is a second Ax, on which is situated the town of Axbridge. Axius was the ancient name of the Vardar, which flows through Roumelia into the Gulf of Salonica, in European Turkey. The names of all these rivers have one common origin in *uisge* or *uis*, the word for WATER in the Celtic language—that language which is still represented in the Gaelic, Irish, Welsh, and Basque.

The sound of *y*, as a consonant, is another which often occurs in the names of rivers. We have the Y, a broad piece of water, rather than a river, passing by Amsterdam. In Herefordshire, and dividing Monmouthshire from Gloucestershire, we have the Wye. Another Wyo occurs in Derbyshire. The Wey is a river in Dorsetshire, and there is another Wey in Surrey, falling into the Thames—

"And chalky Wey that rolls a milky wave."

These names, like the above, in Celtic signify *water*, or a *river*.

Avons are even more numerous than Eskas, or Ouses, or Axes. First, by right of poetic immortality, is the Avon, on which stands the town of Stratford—which, rising in Northamptonshire, passes through Warwickshire and Worcestershire, and falls into the Severn at Tewkesbury. There are two other Avons which pour their streams into the Severn—one which empties itself into the English Channel at Christchurch Bay—one which joins the Usk at Caerleon—one in Devonshire—one in Merionethshire—and one in Glamorganshire. In Scotland there are three of note (besides at least other three of little importance)—one which falls into the Firth of Forth, dividing the counties of Linlithgow and Stirling—one which joins the Clyde (this is sometimes spelt *Evan*)—and one in Banffshire. We are also to recollect that the Avonbeg and Avonmore (that is, the little and great Avon) are the two "waters" in the county of Wicklow whose "meeting" has been so sweetly sung by one of the most delightful of modern poets. There is also an Aven in Bretagne. Avon is simply the general word for river in the British language, a branch of the Celtic. The Irish call it *Aune*, which is also the local pronunciation of the name of the Banffshire Avon.

Lee is another general word for *river* in the Celtic; and we have accordingly rivers of this very orthography in Hertfordshire, in Cheshire, and in the south of Ireland. In Scotland we have the Leith in Edinburghshire, giving name to an important sea-port town at its efflux—and the Leithen, a small tributary of the Tweed in Peeblesshire. A Leith in Westmoreland joins the Eden. There is a Ley in Holland, and in Austria there is a Leytha.

We have a Rhee in Hertfordshire, another Rhee in Worcestershire—a Rea in Shropshire—and the Rhi in Yorkshire, running into the Derwent. The Rye joins the Darwin in Yorkshire, and the Rey joins the Isis in Wiltshire. The Rye also joins the Garnock in Ayrshire. Rhiu in ancient Gaulish signified a stream, and is probably the root of the modern French *ruisseau*, which the Ayrshire poet used quaintly to consider as a translation of his far-famed name. We must also recollect that the Rha, in classical geography, flowed into the Tanais, and the Rha is the ancient name of the Volga.

Duor is another Celtic word for water; and hence we have the Dore in Herefordshire, the Derwent four times repeated in England, two Dours in Scotland,

the Dur in Ireland, the Douro in Spain, the Dora in Piedmont (a tributary of the Po), and the Dordogne in France.

We find antiquaries mentioning *Duna* as a Median term for a river. Are we to suppose this to have given name to the Don which falls into the Sea of Azof—or to the Duna, which flows through eastern Russia into the Gulf of Riga—or to a third Russian river of distinction, the Dwina, which, after a course of five hundred miles, falls into the North Sea at Archangel? If so, we can be at no great loss in supposing that the Don in Aberdeenshire, and the Doon in Ayrshire—Burns's "bonny Doon"—as also the Don in Yorkshire, which gives name to Doncaster, are all from the same source.

It thus appears that the names of a great number of rivers are simply words expressing *water* or *river* in the languages of those with whom the names originated. There is another large class, in which some natural peculiarity of the river has occasioned the name. One of the most remarkable instances of a peculiarity giving rise to a name, is in the Gaelic term *garre*, rough. The channels of many rivers are rough, and we may therefore expect to find this term in the names of no small number. Accordingly, we have the Garry in Inverness-shire, running through a glen, named from its Glangarry; whence the territorial appellation of a race of Highland chiefs, one of whom, a very few years deceased, was much noted in his own country for the enthusiasm with which he sustained all the ancient habits and feelings of Celtic chieftainship. In Perthshire there is another Garry, a tributary of the Tay, and the channel of which is certainly liable to the description implied by the name. In Ayrshire we have the Girvan, with its sweet little vale, sung by Burns—

By Girvan's fairy-haunted stream,
The birdies flit on wanton wing.

The same word occurs in a somewhat different form in Selkirkshire, where we have the Yarrow, so much celebrated both by ancient and by modern poets—

And is this Yarrow?—this the stream,
Of which my fancy cherished
So faithfully a waking dream—
A vision that hath perished.

Wordsworth's Yarrow Valed.

Passing southward, we find the Gare or Yare in Norfolk, with the famed port of Yarmouth at its efflux; besides another stream of the same appellation in the Isle of Wight. But we do not stop even here. The Garonne in France is from the same origin. When the Garonne is joined by the Dordogne, it is called the Gironde, from which word the largest of the eighty-six departments of France takes its name. With how many various things, then, may we associate the phrase *garre*, as applied to signify a rough-channelled river! The gallant Highland chief—the fairy-haunted stream of the Ayrshire poet—the "dowie dens" of Yarrow, and the ballad heroine bewailing her slain lover on its banks—the Yarmouth sands, so destructive of nautical craft—and, finally, the ill-fated party of French republicans, proscribed, starved, banished, and beheaded, in 1793—all are connected by this common tie.

Alan, or a word resembling it, is the name of many rivers. There are, the Alan in Cornwall—the Allen in Dorsetshire—the Allen in Flintshire—the Alwen in Merionethshire—the Alne in Warwickshire—the Alne and Alon in Northumberland—the Ale in Berwickshire—the Ale and Elwan in Roxburghshire—the Elvan in Lanarkshire—the Allan in Stirlingshire. Alwen in British, and Alain in Irish or Gaelic, signifies a white or bright stream. It is very remarkable that in Norway and Sweden, large rivers are commonly called Elben or Elven, by way of a generic name. Elbe is evidently an instance of this generic name having become the appellation of an individual stream: it is one of five hundred miles in length, and its commercial importance need not be spoken of.

Many rivers have a winding course, and winding is expressed, in Celtic, by the term *Taoi*. We have this word in almost its original form in the Tay, the most copious river in Scotland, the meandering of which is so very striking a peculiarity, that, long after the significant origin of the name was forgotten, poets could not help speaking of "the winding Tay"—a phrase which, of course, must be reckoned a pleonasm or redundancy. The Towy in Wales, and the Tavy in Devonshire, are very near the original form of the word. In Devonshire, also, we have the Tav, and the Tave occurs in Caernarthen and Brecknockshire. Then we have the Tajo (pronounced Tayo) flowing through Spain and Portugal, with the city of Lisbon situated at its efflux. The Tava flows into the Danube, and there is another river exactly so designated in Moravia. There is also a *Tay* in China. The Tees is a modification of the same term. We have a river of this name in Yorkshire, and many others throughout England. There is also the Thiss, a large river, flowing through Germany into the Danube: it anciently formed the western limit of the Daci, and is now considered as the second river in the Austrian dominions.

The sound *Tam* occurs in the names of several rivers. There is first the great Thames itself. The Tame runs through Staffordshire. The Temo flows into the Severn near Worcester. The Taume is a river in Yorkshire and Lancashire. We have also the Tamar in Devonshire. The Tames gives name to Temeswar, a strong town in Hungary. These rivers derive their name from the Celtic *tam*, still or quiet.

The Ayr in Scotland is said to get its name from the clearness of its waters—*ar* being bright in Gaelic. We are probably to refer to the same circumstance

the origin of the Aire in Yorkshire, the Arun in Sussex, the Are in Switzerland, and the Era and Arn in Tuscany. The Ure, we may add, is a river in Yorkshire, and one of the same name falls into the Moselle.

The Dove in Derbyshire, whose dale is so celebrated for its beautiful scenery, is from the Celtic *dobh* (pronounced *dhore*), meaning a swelling flood. The Dove or Dyff in Merionethshire is of course from the same origin, as is the Dovan in Clackmannanshire. Of the last-mentioned stream, the Earl of Stirling, a native of its banks, thus speaks:—

But dangerous Doven, rumbling through the rocks,
Would scorn the rainbow with a new deluge.

The English Loder, and the Berwickshire Leader (giving name to Lauderdale), are both from the Gaelic *loder*, strong. Cam, Gaelic for crooked, gives an appellation to the Cam in Cambridgeshire, the Cam in Gloucestershire, the Camel in Cornwall, and probably also to the Kama, a tributary of the Volga, dividing for a long space Europe from Asia. Min, Iberian for smooth, in the first place forms the name of the Minho between Spain and Portugal; then we find it in the Minio or Mignone which falls into the Tuscan sea—as also in the Mincio, in northern Italy, the stream which Virgil has rendered famous; and finally in the Munnon, an inferior English stream.

We can enumerate many other rivers having the same or similar names, though we cannot state in all cases from what term they are derived. There is, for instance, a Tyne in Scotland, and another well-known Tyne in Northumberland—a Teign (the same word) in Devonshire, and a Teino which flows by Pavia into the Po. Tain, in Gaelic, is a running water. There is a Lyne in Staffordshire, on which the minor Newcastle stands, and a Lyne, a small tributary of the Tweed, in Peebleshire. There is a Clyde in Lanarkshire, another in Flintshire, a third in the county Louth, in Ireland, and a Cluden in the stewartry of Kirkcubright. Clyd in British means warm or sheltered. The Nith of Dumfriesshire reappears as the Nid in Yorkshire, and the Neath in the county of Glamorgan. There is an Eider in Ireland, and an Eyder in Denmark. The Sure passes Waterford: the Sure also empties itself into the Moselle in Luxembourg. The Stour occurs in Warwickshire, and five other English counties: the Stoura falls into the Po, and the Stura into the Tanaro in Italy; and Nearchus, by command of Alexander the Great, sailed down the Stour, a branch of the Indus. *Senus* is the Latinised name of the Shannon, in Ireland (from Sen, Celtic, great, grand, slow): the Seine passes Paris; the Saone is a tributary of the Rhone; there is also a Soan, a tributary of the Ganges, and Ptolemy marks the Saona as a river in Ceylon. The Oke is a river of Devonshire: in Berkshire is the Oak. In Irkutsk, a province of Asiatic Russia, we have the Oka. The Mease falls into the Trent near Derby; the Maese is a river in Holland; the Meuse of France falls into the Rhine; and the Meuse of Switzerland falls into the Ticino. The Brent is a river of Middlesex; the Brant of Anglesey rises near Beaumaris: the Brenta runs through the Venetian territory; and the Brentz is a river of Wirtemberg, which falls into the Danube. The Leche of Gloucestershire falls into the Thames; the Lichers or Lech in Germany flows into the Danube; and the Lick of East Prussia flows also into the Danube. The Laden is a river of Durham, and the Ladon is in Arcadia. The names of the principal rivers of India, the Hypanis, Baris, Chobar, Soana, Cophis, Phanis, and Indus, are all found in the west. The Indus is a river in Caria, and the Indya is in Lapland. Finally, the Acheron, a river of Egypt, occurs in Elis, Epirus, Pontus, and near Cuma in Campania.

OCCASIONAL NOTES.

EXEMPLARY BENEVOLENCE.

In a small book lately published, called "Hints to Mechanics," by Timothy Claxten, who is himself a working man, and one of those whom our country has reason to be proud of, we find a pleasing instance of the large amount of good which may often be done at a small cost by persons in moderately easy circumstances. Timothy, as he informs us, was the son of a day-labourer, who, having a numerous family, and but very slender means of supporting them, was unable to afford his children even that small share of education which is usually considered sufficient in the rural districts of England. From this hopeless condition of unlettered youth, our hero was fortunately rescued—and this is the instance of practical benevolence to which we wish attention directed—rescued by a lady, "who, as long as she lived, kept six boys and six girls at school for two years each, one-half leaving every year to give place to new ones." He was chosen, as he tells us, to fill the place of a lad who had played truant, and thus was put in the way of acquiring a sufficiency of elementary learning to stimulate his energies and carry him through life with success.

When sent to school by this lady's kindness, "I was (says he) a year younger than that at which the boys were usually admitted. Once a year the teacher was required to parade us at the mansion of our generous patroness, where we underwent a sort of examination; she then inquired of those leaving school what books they wanted, and in most cases had them ordered. After the ceremony was over, each pupil was presented with a shilling, and all proceeded to another room, where a sumptuous dinner (as we thought it) was spread out, at which we were attended by the

servants. At this school I learned my reading and writing, and advanced in arithmetic, in which I was rather quick, as far as the rule of three. All this was a great step gained; and I desire here to acknowledge what I owe to my patroness. It is remarkable how easily a person so disposed, with even much smaller means than this good lady had, may do a great deal of good, as well as produce much happiness, among her fellow-creatures. Perhaps some kind soul, who honours my humble memoir with a glance, may gather a hint even from this."

With the view of giving the *hint* of the author all the publicity which it deserves, and which these pages may afford, we offer it to the attention of our readers, and trust it may not be without its use. Here is an instance of a lady in some obscure village in England, who, at a comparatively insignificant outlay, must in her time have done an incalculable degree of good. We venture to say that the total amount of her annual disbursement could not have exceeded eight or ten pounds, a sum which thousands of persons in only moderately comfortable circumstances are in the habit of squandering occasionally in a manner at once thankless and unsatisfactory. How much more excellent, also, was the unostentatious benevolence of this kind-hearted woman—how much more productive of delightful feelings to herself was the plan she followed, than the vulgarly ostentatious practice of bequeathing large sums at death for the rearing of monumental structures in the form of hospitals and almshouses!

THE ENGLISH AND AMERICAN COPYRIGHT QUESTION.

In the United States of America, British literary productions, music, &c., have never enjoyed any copyright. All the best English publications, whether in the form of books or periodicals, have been regularly and systematically reprinted and re-issued by certain publishers in New York, Boston, and Philadelphia, to the exclusive profit of these personages. Lea and Blanchard, the Harpers brothers, and several others, have for years followed this lucrative traffic, but particularly the Harpers, who now possess one of the largest publishing concerns in the world, and are enabled to issue every popular London work within a few weeks after its first appearance here. In most instances these American editions are considerably cheaper than those of London, from which they are copied, and hence they readily find their way to Canada, New Brunswick, Nova Scotia, and other British possessions, where, by the feebleness or carelessness of the executive government, and the difficulties in the way of any legal check from the British proprietors of copyright, they are sold without let or hindrance. Practically, the whole of North America is abandoned by English booksellers to the publishers in the States.

The general government of the United States has all along sanctioned and encouraged this use of the property of British authors. It has, in the first place, disallowed our authors from obtaining any copyright over their productions in the States; and, in the second, prevented the importation of English printed books, except at a prohibitory duty. Very loud and long complaints have from time to time been made in this country against these practices, but without leading to any good result. The Americans have either disregarded or ridiculed the remonstrances which have been made to them; and excepting the efforts made by Mr Clay in the general legislative assembly to pass a law protective of British interests, on a principle of reciprocity, there has been a woeful lack of exertion in the cause.

Things are now beginning to take a different turn. Till within the last twelve months, American authors might sell the copyrights of their works to English publishers, and these copyrights were valid, or at least considered so by the public. On principle, this was a most unfair thing, because British authors could confer no such copyright on American publishers. In other words, Americans had liberty to bring their literary wares hither, but we had no liberty to take our wares to America. The law has cured this absurdity. By the lately passed international copyright act, American authors can neither hold nor sell their copyrights in this country, until the American government chooses to give protection to the works of British authors in the States. This law is bringing the Americans to their senses. Since it was passed, a considerable number of works, hitherto the property of American writers though published in England, have been reprinted in a cheap form in London and elsewhere, and in future no American author will get a shilling for any work he may offer for sale in this country. We begin to perceive from the *New York Mirror*—a remarkably clever literary print, which to its credit has always advocated the principle of mutual copyright—that this mode of making reprisals is far from palatable in the States, and will, to all appearance, bring about the necessary remedy. "We are glad (says the *Mirror*) to see that an intelligent portion of the press in this country is directing public attention, more and more, to the importance of establishing an international system of copyright between this country and England. The subject is daily becoming one of more importance. American authors, notwithstanding the depressing competition of an army of unpaid English writers, are growing in stature and strength. In looking over a late number of the London Athenæum, we were struck by the fact that in an advertisement of ten works in the press,

six were by American authors! We are glad to see that Mr Clay perseveres manfully to carry through his important measure of an international copyright. His very able report on the subject shows that he is a perfect master of its details, and we really trust that his appeals to the justice and good sense of Congress will not be without their effect. The honour of the country, and the interests of our infant literature, demand that the system of crowding out all native productions by a flood of trashy novels and biographies of English manufacture, propagating English prejudices and English opinions, should be done away with, and that native authors should be admitted to equal privileges with those of foreign countries. 'A fair field and no favour,' is all that is claimed for both parties." The *Mirror*, in the succeeding number, is still more emphatic—hopes that English publishers "will go on in their course of retaliation," for they have a right to do so. "We hope (it continues) they will do it, so that American authors may be forced into a championship and defence of their peculiar interests in this question, to which they have hitherto manifested a strange and suicidal indifference."

We wait with anxiety to hear the result of Mr Clay's honourable attempt to set this matter to rights. England and America are now becoming so closely united by steam communication, that so paltry a cause of dispute should not be suffered to exist between them.

REV. MR OTWAY'S TOUR IN CONNAUGHT.*

MAKING allowance for the party feeling inseparable, we presume, from the writings of an Irishman concerning his own country, this is a lively and most agreeable book. Mr Otway possesses a large share of the mercurial humour ascribed to his countrymen—is well acquainted with Ireland, its history, its traditions, and its national character—and wields a free and ready pen. Amongst other good qualifications, he has that of telling a story with point and effect. The consequence is, that his works on Ireland are as unlike those of such writers as Inglis and Barrow, as a Scotch novel by Walter Scott was unlike one by him who wrote "Walladmor." In the present volume he has given exactly such a detail respecting the district he visited as we could wish to see written respecting every part of the United Kingdom—not only a survey of its social and economic condition, but a collection of every thing in the shape of history, legend, and tradition, that appertains to it—thus conferring on what to the common eye appears as mere hill and dale that wonderful moral charm which arises from its association with the doings and sufferings of human creatures. We are aware that there is not much encouragement in or out of Ireland for works like this; but yet we cannot help expressing a hope that the attractions of the present volume may prove a cause for the appearance of others constructed according to the same plan—"barring" the polemics.

As a specimen of Mr Otway's book, though rather a long one, we present a portion which embraces local description and narrative only too characteristic, we fear, of Ireland:—

"On leaving Athlone you proceed westward, through a district very ugly by nature, and instead of being improved, deformed by its inhabitants. Chains of limestone gravel hills, rising out of red flow bogs, stretch away, their ranges being nearly at right angles with the Shannon, and it would appear that at the subsidence of the waters under which this country was once submerged, the decreasing torrents, in seeking the great central drain of the island, left these enormous deposits of sand, gravel, and rolled stones. These gravel hills, covered with a shallow but kind and warm soil, support a superabundant population; a population, no doubt, encouraged to increase, more especially here, by the great facilities of obtaining fuel, the only comfort of the poor. This increase seems to have met no discouragement from the prudence or fears of the proprietors of the soil; and the consequence is, that, as you proceed to Ballinasloe, you pass through an almost continuous village, and are forced to observe a wretchedly clad people inhabiting wretched houses, and carrying on a wretched and destructive tillage within minute enclosures, fenced by dry stone walls of the rudest construction possible: indeed, the soil seems miserably exhausted, and you see very deficient crops of potatoes and corn, and at once can explain the cause in the almost entire absence of cattle to make manure, and therefore burning of the already too light soil is resorted to as the only means of stimulating the ground to produce a crop—and such a crop, the white lump—*the tired earth* unable to bring to perfection even a red potato—the people thus reduced to subsist on the very weakest and least nutritious variety of the lowest kind of food. Moreover (and, indeed, this must surprise an Englishman not a little, considering the great abundance of people and the actual idleness of the larger portion both of young and old), the crops are not kept clear from weeds—weeds that children might pull up and collect for manure, are allowed to grow and run to seed, and as they do so, not only deform the face of the country, but actually help to exhaust the soil. It was to me, as I passed along, a matter of great wonder how the landlords could allow their properties to be so

subdivided and maltreated—how allow a tenantry to increase and multiply beyond the means of subsistence, beyond the power of drawing much more than mere existence from the land they cultivate; and if such be the results already, what must be the more alarming ones hereafter, and what is to become of such a people when one of those very frequent failures of the potato crop takes place; and how will a poor-law then operate—how affect the relative states of land-owner and occupier! Such considerations engrossed my mind as my jaunting-car swept along, and I could not help observing to my fellow-traveller, 'Well, of all parts of Ireland I have seen, I know no portion that upon the face of it exhibits more symptoms of the perhaps now inert existence of the Rockite disease; as sure as effect follows cause, so must this plague spread amongst such an ignorant, half-fed, and abounding people, who cannot possibly be worse off, except under a famine of the potatoes; and who must ever remain under the apprehension of their only means of subsistence failing, and thus their great poverty ending in absolute destitution.' My friend, who was well acquainted with the state of the country, and had peculiar opportunities of knowing the habits and feelings of the people, told me (in corroboration of what I had apprehended) the following circumstance.

A family once highly respectable, and possessed of considerable property in this district, in consequence of that inconsiderate extravagance so much the characteristic of Connaught gentry, were reduced to very embarrassed circumstances, and so in order to meet the numerous charges on the estate—jointures, annuities, interest on younger children's portions, and on money borrowed—it was resolved to turn the fine old sheep-walks, of which the estate principally consisted, into tillage, and make settings to tenants, who flocked in, covenanting to pay high rents, and who, while the soil remained fresh, and markets for corn good, actually paid the rents they had engaged for. But, by and bye, these tenants are allowed to underlet to other PROMISERS of higher rent, and from the small farmer springs up the cottier, as sure as bad husbandry produces weeds; and then the war ceases, and prices fall, and Mr Peel's bill for the resumption of cash payments comes into operation, and creditors insist on the payment of the debt in gold, which was lent in paper—and now arrives the time when there takes place a lamentable difference between the promise and the payment of rent; and in the mean time jointures *must* be paid, and the creditor *must* have his pound of flesh—and then ensue foreclosures of mortgages, custodians, and law-court receivers. Attorneys alighted on the vexed estate, and fastened their claws on it, and fattened as flesh-flies do on a festering sore. In this state of things, the owner, who was a young man, did what was wise and honest—he broke up his establishment, he let the fire out on his paternal hearth, and went to live poorly, but secretly, on the continent, leaving the nursing of the estate to a younger brother—perhaps he would have done better had he sold it; but those only who are reduced to the dire necessity of selling their ancestral inheritance, can tell how bitter it is to take such a deep plunge downwards; and what way will not be tried before this last leap is taken! Besides, perhaps, he could not sell; it is not easy in general to make out a clear and marketable title to Irish estates. But be this as it may, the owner had confidence in the firmness, the integrity, and discretion of his younger brother, and he left him as his agent; and he honestly and with diligence set about to force the tenants that were solvent to pay the rents they had undertaken for, and those who were not solvent, and incapable from idleness, ignorance, and bad habits, of meeting their engagements, he endeavoured to force off the property, giving them every aid that the limited means at his disposal would permit, to remove to some other location; he gave them their potatoes and furniture, and, if they desired it, the materials of their cabins. It does not appear that he did any thing unjust or oppressive, either to those he allowed to remain, or those he evicted. But still he became exceedingly unpopular; even those who could pay, combined to refuse payment, either from fear of their neighbours, or from the expectation that they could evade it altogether, in consequence of the landlord's embarrassments, and in the midst of hostile legal proceedings. In all parts of Ireland attorneys are to be found who stimulate tenants to such evasions, and who live upon the differences between landlord and tenant. Such became now the state of this deranged property: some were forced off the estate; others under ejectment, by advice of their lawyers, were taking legal steps to retain their holdings, without paying rent at all.

Alas for the poor young man who undertook such an agency! The dire spirit of Rockism rose in its wrath against him, and he *must* die.

In this vicinity, as in many others similarly circumstanced in the south and west, a character is to be found—a fellow from his youth up given to dissolute practices; with considerable natural ability, with great vigour and activity of body; a violent temper* that

never has been quelled, and strong passions that have always been indulged; such a person is given to no regular labour—he will work, it is true, more than any other at certain times, and under strong excitement—he will be found digging out a poor widow's potato field, or his reverence the priest's, and that more especially when whisky and a dance are to be at the end of the job. But if inconstant at labour, he is a regular attendant at fair, market, patron, wake, or hurling-match; if there ensue a row, and his presence almost insures such a result, he is at the head of it, the ready promoter of all kinds of RUXIONS—his skull, shins, and arms, are covered with scars of cudgel-wounds received therein. You may be sure he does not go near the confessional—he dare not go down and 'whisper at a priest's knee'—and he never marries, but nevertheless is the neglectful parent of a multitude of children. At times well, and at others shabbily, dressed, he has always the air of a rake, and the leer of a profligate; he is sometimes sober and good-humoured, and good-natured, and would go through fire and water to serve one of his own faction; he is oftener drunk, and that for days together, and then he is a ferocious dangerous brute. It is not exactly known *how* he lives, and no one can exactly tell his 'whereabouts'; but he is known to be a good shot—killing wild-ducks by night, forms part of his ways and means; and though so often light-hearted and joyous in his department, it is known that he cares no more to shed human blood than he would to stick a pig.

The aggrieved party on the estate in question, consisting of fourteen, having resolved to take the agent's life, cast their eyes on a man of this character, and they hired him as one whose heart was firm, and aim sure, to fire the shot; but still fearful of their brave, they determined that one of them should accompany him, and that individual was fixed on by lot. Accordingly, the two waylaid their victim at a spot they knew he *must* pass, on his return from dining with a neighbouring gentleman. The scheme succeeded; the bullet was true to its mark; Mr — was shot through the heart, and the murderer and his companion walked leisurely away: known as they were to thousands, not a man gave information. The event, of course, for a time made a great noise—rewards were offered—the police were on the alert—and then all blew over. The bravo for a time kept out of the way. This was not extraordinary in one who had no settled home; but by and bye the money he was supplied with was spent, and he returned to give his employers very broad hints that he *must* have more. The Rockites now took counsel together—they saw the danger they were in from being in such a reckless ruffian's power, and they resolved on their remedy. He was called to their meeting—he got more of their money—he was then informed that they wanted another cast of his hand, in order to put out of the way another obnoxious gentleman who lived on the other side of the Shannon, and they engaged him, nothing loath, to come along with them to do the deed. On a dark blustery night they accordingly embarked in a cot on this dreary river, that here steals through bogs and morasses its deep and silent course; and while in the middle of the stream, the bravo was suddenly caught hold of, and before he had time to collect himself for resistance, was tossed overboard, and as he rose after the plunge, and attempted to catch the boat, a heavy oar's blow, aimed with vigour and certainty at his head, sent him again to the bottom, and, as it was hoped, never more to rise. But in this they were mistaken, for, by and bye, he was seen swimming steadily and lustily towards shore, and then it was that one of the party, resting the ruffian's own gun on the gunwale of the cot, fired with sure aim, and sent the bullet through his brain. The fellows waited till they saw that he would *now* rise no more; they then went home, kept their own secret, and all was safe. But some time after, in the usual process of decomposition, the body rose to the surface, and was found amongst the reeds. A coroner's inquest was summoned, a doctor, *pro forma*, called in, and after a cursory inspection the usual verdict of 'found drowned' was about to pass; but while the coroner was writing out the proceeding, one of the jury passing a small switch through the profuse curls of the dead man's head, found his switch enter, and, as through a hole, pass out at the other side; this, of course, led to a more exact examination, and the man was found to have died of a gunshot wound, inflicted by some person unknown. Still a year or more passed on, until, in the dusk of a winter's evening, as the chief constable of the district was sitting by his fire, a message was brought to him, stating that one in his hall wished to speak with him. He accordingly had him introduced, when, in a way not at all common with the Irish, and in apparently the deepest agony of remorse, he told the guilty story from beginning to end. He said that though he had confessed all to the priest, and gone through many penances, yet he could not find ease for his conscience—that life was a burthen—that he desired to die, even suppose it was by the hangman's hand. He named to the constable all the individuals concerned; said that a large portion of them were at that very moment on their way to the jail of Galway, to visit others of the confederates who were confined for some other crime. By means of this information the constable succeeded in arresting almost every one of them. I do not know what became of the repentant murderer, for he was the one upon whom the lot fell to go along with the bravo to shoot the agent. I must conclude this, I fear, too

* Tour in Connaught; comprising sketches of Clonmacnoise, Joyce Country, and Achill. By the Author of "Sketches in Ireland." W. Curry, Jun. and Company, Dublin, 1839.

* I consider the lower classes in Ireland to be particularly negligent in curbing the tempers of their children. The little ones of the cabin are, year after year, accustomed to be over fondled or over punished, and all according to the instigation of the present passion: and victims as they are of an affection that pollutes serious faults, and of a wrath that punishes without reason—no wonder we see so many instances of passionate excess—no wonder that the savage hand is so often lifted up to strike and commit homicide.

long narrative by stating, that the chief constable, a most trust-worthy and efficient officer, declared that in all his experience of Irish criminality, this informer showed the only evidence of genuine and uncontrollable remorse. And, reader, after all, I do not regret having told this story, because I think it goes a great way to explain much of the predial evils of Ireland. I think it goes to show that Ireland's over-population, with a barbarous, reckless, vindictive multitude, is in a great measure owing to the improvidence and pecuniary distresses of the landlords. Are not the present race blamed for the faults of many generations? This would qualify the censure—that there has not been that watchful and protective guardianship on the part of their fathers—that they have been as improvident in the selection of their tenants, as they have been profuse in their hospitalities, and heedless in the choice of their guests. The truth is, that the present generation is suffering for the sins of their progenitors; the fathers have sown the wind, and the children must reap the whirlwind."

TRAITS OF THE CAT IN HINDOSTAN.

CATS are domesticated in nearly every house, and yet very little is generally known concerning their true character. They have got a bad name, and few are at the pains to discover whether they merit it or not. A love of dogs, and a hatred of cats, seem to be studiously inculcated; and although justice may occasionally be done to the maligned race, and individuals may become great favourites, common prejudice remains against them, and they are stigmatised as being savage, revengeful, and treacherous. The cat is perhaps not by nature friendly to man, and differs in this respect from the dog, who voluntarily attaches itself to the human race; nor will it continue to follow and serve him under ill treatment, for unkind usage renders it shy, suspicious, or fierce. But it is equally capable of the strongest degree of affection, and is equally faithful in its attachments. A peculiar method, however, must be pursued to elicit these qualities on the part of the cat. It does not understand teasing, and requires to be won by steady, genuine, and consistent kindness. The cat in its domesticated state is said to form an attachment to the place of its residence, rather than the people with whom it resides; but this will only be found to be the case when it is treated with indifference by the family; for of the cats of which honourable mention will be made in the following pages, not one manifested any predilection of the kind. The unfortunate association during the dark ages of cats with witchcraft, occasioned a strong prejudice against the unhappy animal condemned to endure the most odious imputation, an imputation which the sagacity it displays only tended to confirm. This notion is nearly, if not entirely, exploded in the civilised portion of the world; but another, equally erroneous, is still entertained, it being supposed that cats have a propensity to suck the breath of sleeping infants. Zoological writers have exposed the fallacy of this opinion, by showing that it does not accord with the construction of the animal; and we may hope that in the general spread of a most useful and entertaining branch of knowledge, that of natural history, the cat may be acquitted of any evil design against infant life. Its fondness for warmth and a soft bed may lead it to seek repose in the cradle, and it might injure the respiration of a baby by too close contact, as nurses sometimes overlay children; but there is no *malice prepense* in the case, and a petted cat would in all probability have too much good sense to commit this kind of mischief, for in no animals are the intellectual faculties so strongly developed by a judicious process of education, as in the cat. Various dispositions will be displayed by different individuals, but the result will in all cases be the same; they will become docile, affectionate, and exceedingly sagacious, understanding every thing that is said to them, and communicating their own wants, feelings, and wishes, in return, in very expressive language.

Nearly all domesticated animals, and the cat in particular, will exchange their own wild natural cry for acquired sounds; the mewings of a petted or a neglected cat will be very different; and each, besides the universal purr, will have a peculiar way of its own to express its satisfaction. In some I have observed a kind of chuckle or crow, and all will be distinguished by some variety. It is astonishing how soon a petted cat will learn to respect other favourites of the establishment, and how safely birds may be kept within its reach; a fact to be ascertained at nearly every bird shop, where cats may be seen threading their way behind the cages in quest of mice. Cats, however, to be thus trusted, must be well fed; and it is a mistaken, as well as a very cruel policy, to keep them hungry in order to make them good mousers. A cat, maintained in health and spirits by sufficient food, will hunt for its amusement with more alacrity than the poor half-

starved creature obliged to pick up a miserable subsistence by the chase, a circumstance certain to render it a thief. A little meagre cat, which I once purchased, would lie upon a chair, gazing listlessly at the mice playing round it, and offering them no sort of molestation; while a few weeks afterwards, when in good condition, she not only kept the house free from these intruders, but would watch for and catch much larger and more dangerous animals of the lizard kind, creatures nearly a foot long, and exceedingly dreaded by the natives of Hindostan.

Having resided for a considerable period in India, sometimes in lonely places, affording little amusement excepting that derived from watching the habits of the animal creation around, and at others dependent during the most sultry hours of the day upon the companionship of domestic pets, I had many opportunities of studying the feline character, and consider it to be but an act of justice to give the following unvarnished relation of the tempers and dispositions of a very misrepresented class. In none did I ever find a single instance of the treachery or ingratitude for which cats are proverbially infamous. In voyaging up the Ganges, the boat was so much infested with vermin, that, although not predisposed in favour of the antidote, we procured a half-grown male kitten at the city of Rourhyr. The animal was of course treated with great kindness, and seemed to be perfectly happy in its new situation; but we did not give it credit for any superior intelligence, until one day I was shocked at seeing one of our birds, which had escaped in consequence of the cage-door being left open, in the cat's mouth. Instead, however, of doing the poor thing the slightest injury, puss brought it to her master perfectly unharmed, and seemingly frightened by the adventure. On our arrival at Benares, while visiting some friends, we left the cat in the boat, under the impression that it would not relish a removal to a strange place; and upon our return, after an absence of twelve days, were surprised by the manifestations of joy which it evinced at seeing us again. Puss now got into very great favour, and showed, by her affectionate demeanour, how well he appreciated our kindness. At length we reached the place of our destination, and in the distribution of the pets, the care of the cat devolved upon me. It travelled very contentedly in the palanquin, and on arriving at a large rambling dilapidated bungalow, which, there being no places of public entertainment in this part of the world, was to afford us shelter, the cat, not in the slightest degree discomposed by the change of abode, enabled me to pass the night in comparative comfort, by voluntarily taking up a position upon my bed, which, not having its usual defence of mosquito curtains strained tightly, and tucked in all round, and thus affording a good security against the inroads of vermin, might otherwise have been visited by most unwelcome guests.

After the sojourn of a week in this dreary mansion, the departure of one of the few residents of the station enabled us to purchase another in better condition, to which we removed; the cat, of course, accompanying us. We observed that both he and his successors, on changing their abode, would inspect every apartment, smelling them all round, and, having thus completed their survey, would settle quietly down, and make themselves at home. Tom was for some time exceedingly happy; he would roam abroad a little bit only for an hour or two; and if in the cold weather he found the doors closed, would utter a low gentle sound, to ask admittance. In the evening, in our walks, it would always follow us across the plain; and if we dined out, would accompany us, waiting, if there happened to be a cross cat or dog in the mansion, on the outside, ready to attend us home. The sensibility which this affectionate creature showed, proved, like that of many human beings, inimical to its happiness. After a time, some Afghan traders came to the station with cats of the Persian breed, among other articles, for sale. We purchased a very beautiful half-grown kitten of these men, which our older favourite beheld with not less astonishment than dismay. The first time that he saw my brother-in-law take this kitten in his arms, he went to his feet, looked up in his face, and uttered a piercing cry. We were, in fact, quite distressed by the grief which it manifested at the appearance of a rival, and endeavoured, by every means in our power, to reconcile the poor thing to the encroachments on its privileges by another, caressing it more than ever, and taking care that it should be supplied with food whenever it returned home, whether by night or day. It now absented itself more frequently, and for longer periods, than formerly, but never manifested any spite against the intruder; playing with it occasionally, and merely showing its dissatisfaction by moping about. During one of its absences, another string of camels passing, we took a fancy to a black female kitten, likewise a very beautiful creature, and purchased it for seven rupees, that is, fourteen shillings. Puss returning about noon, walked into the drawing-room, and seeing a second cat domesticated in the family, looked perfectly agast. Withdrawing into a remote corner, he squatted down, and kept his eyes fixed upon the intruder, taking no notice of our attempts to soothe him, and refusing the food we offered. In this manner he continued to watch the whole day, and in the evening went away and never returned. We heard that he had taken up his quarters at another bungalow, the only one occupied by a family whom we did not

visit; but we never saw him afterwards. We often hoped that he would come back to us, more especially as we were told that he had been beaten for thieving; but neither hunger nor ill treatment could induce him to revisit the house where he had been supplanted. We grieved exceedingly that the poor cat should have taken the affair so much to heart, but could not help being pleased with an instance of sensitiveness of so extraordinary a nature.

Our Persian kitten received the new addition to the family very differently, showing ever the most affectionate interest in the stranger; the little creature was exceedingly shy and timid, and was fond of creeping under a very low footstool for concealment. Tom would take up his station close to this stool, and lie upon it all night, to be near his companion. We found some difficulty in gaining the confidence of our new acquisition, for Tupee, as we called her, was particularly fearful, differing very widely in that respect from Tom, a bold fellow, the best tempered creature in the world, and full of trust and confidence. About this time a very tiny terrier puppy was added to the establishment; and all three agreed marvellously well together, playing till they were tired, and then going to sleep close to each other. Tom would sometimes betake himself to repose in one of the bathing-rooms, and curl round in a large circular brass basin, much used in India for washing the hands. If any of the party, in going into this apartment when he was thus ensconced, offered to stroke his head, he would shake it, uttering a sort of grunt, as if annoyed at being disturbed; but this was all affected; for if we passed through without taking any notice of him, he would rouse himself a little, and call after us, sinking again to sleep upon receiving the expected caress. This fellow being unacquainted with the nature of a blow, and of a most fearless disposition, would only jump up and play with a stick or whip if shaken over him, while Tupee, on the contrary, seemed to have an intuitive sense of danger. Notwithstanding her timidity, however, she possessed a high spirit, and would not put up with an affront. One day, while playing in the verandah, the dog jumped suddenly out, and startled her excessively. She sprang out of the way, but turning round, and discovering the cause of her alarm, she went up to the puppy, and gave him a pat on the face. At another time, being in a house with a stranger dog that snarled at her, when she good-naturedly attempted to play with it, on its repassing the stool on which it was sitting, she gave it a good cuff. We had the misfortune to lose Tom soon after he became full grown; some workmen had been employed about the premises, who showed themselves so much delighted with the cat, that we could not help suspecting them of stealing it when it disappeared.

We now removed to a larger station, carrying Tupee with us, and during our residence at this place occupied three different houses; we never observed her to manifest any annoyance at the change of residence, only appearing to be uneasy when put into some strange conveyance, to which, however, she was speedily reconciled, if the dog accompanied her. Her attachment to this terrier was very strong. Whenever it was absent for any time, she would evince the greatest joy at its return; indeed, upon all occasions she manifested a very affectionate disposition to those with whom she associated.

Among other odd ways, Tupee had a fancy to get upon the beds early in the morning; she would walk up to the pillow of the occupant to be stroked, and if kept waiting, would give a gentle tap on the face with her velvet paw; if this did not succeed in arousing the pretended sleeper, she would as gently bite the chin; and having received the expected caress, would lie down gently for a while, and then go into another room, and do the same. Many nervous persons would have been alarmed at our favourite's method of engaging our attention, but we trusted her, and never found her treacherous. We had now an opportunity of seeing how she would behave under the same circumstances which had produced so tragical an effect upon her predecessor, for having had a present of a Persian kitten, it was brought home. No sooner, however, did it make its appearance, than the vixen flew at it, and fairly beat it out of doors. I made several attempts to establish it comfortably in the family, but in vain; Tupee had no idea of yielding quietly and sorrowfully as the other cat had done, but maintained every point of law in her favour with teeth and talons. The kitten, therefore, was given away to a gentleman who promised to befriend it.

We now took another journey, and having found a cat rather a troublesome companion in my palanquin, it was agreed that she should travel in a basket with the female servants, in their bullock carriages. Their departure took place several hours previously to our own, and Tupee was upon my lap when summoned to her basket. She instantly began to cry; and when we reached the encamping ground the next morning, we were made aware of our approach by the well-known voice, mewling with all its might. We found puss tethered to one of the tent-pins; and the moment the palanquins were put down, she ceased her vociferations, and became quite content, purring and showing her pleasure in her usual manner, although not relieved from the tent-pin, as we were afraid that if left at liberty she might stray into the jungle. When taken away from us, she recommenced her wailings, which continued without interruption until she saw us again. When about sixteen months old, Tupee became a

mother for the first time, and performed the maternal office to the only two kittens born alive, with great care and tenderness. Cats are admitted to be remarkable for love of their offspring, having the organ of philoprogenitiveness very strongly developed, and although sometimes destroying their young, only for a very sufficient reason. A naturalist of considerable celebrity has accounted most satisfactorily for a circumstance which has told against the cat, by stating the cause of the perpetration of apparently so unnatural a deed, which is committed only when the mother finds that she has no milk for the support of her offspring. Ewes fed upon certain salt pastures in Australia are induced by the same cause to act in the same manner. The kittens, which were male and female, and named Tarty and Tom, were dissimilar in their dispositions. Tom was exceedingly gentle, but the most inquisitive of his race, evincing the curiosity common to all in a very extraordinary degree. He would watch the movements of the people at work about the house with untiring patience; sometimes stationing himself about a yard from the men employed to root up the grass in the close vicinity of the mansion; an operation which must be performed very frequently during the rainy season, to prevent snakes from lurking around the premises unseen. Tom took the strongest interest in these weedings, always going out to superintend them; he conciliated every body by his gentleness and pretty ways, while Tarty, though affectionate, was of a fiercer nature, and liked nothing so well as hunting. When disappointed of the sparrows or the lizards which she thought were within her reach, her rage was quite amusing; she would look up after them, and snarl with vexation. At sunset we always went into the garden, or walked on the terrace, and the moment we left the house, the cats and dogs, for we had now another puppy, gathered round us, frisking and playing about, and jumping up at us as they ran along. Circumstances taking me to Calcutta, Tupee and Tom were placed under the care of my servants, who made the journey by water. Their beauty, and the greater difficulty of procuring specimens of the breed, rendered them very valuable at the presidency, five pounds being given for an animal of the kind. I resided at this time in a large house in the midst of grounds in a fashionable suburb; and Tom, straying over the wall one day, was stolen by the servants of some of the neighbours, by whom he was much admired. He had been lost once before, but immediate search being made after him by a very intelligent servant of mine, he was found at breakfast with a gentleman, who could scarcely be prevailed upon to surrender his guest. This man was unfortunately absent on leave at the time of the second elopement. Although there are always a great many domestics lounging about an Indian mansion, it was necessary to appoint one whose sole business would be to look after my remaining cat. I therefore hired a little boy for the purpose, telling him not to permit her to go out of his sight. The poor child, attending to the letter rather than the spirit of his instructions, always kept within a yard of her, and she soon discovered that she was under constant surveillance. She consequently took a great hatred to her keeper, but never scratched or injured him in any way, her method of showing her dislike being a very curious one: whenever I appeared upon the scene, she would run to me, and, on passing this too vigilant sentinel, would look up, and make a grimace at him, uttering at the same time a sound very expressive of her enmity. Tupee was at length taken ill, and unfortunately not having any skilful person to whom I could apply for advice, the remedies which I tried proved unsuccessful. The night before her death, I kept her in my arms, and while undressing for bed, laid her upon my feet. I afterwards placed her on a chair at the bedside, but that did not satisfy her, and I therefore laid her upon the pillow; she put her head close against my throat, and purred all night louder than I had ever heard her before. She jumped off my lap on the following day, staggered and fell, dying soon afterwards. I had her buried under a cypress tree in the garden, and need scarcely say that I lamented the loss of so affectionate a creature. Meanwhile, my brother-in-law also travelled to Calcutta; he came by water, and lost Tarty at a village on the river Jumna, where he halted for the night. He remained two days at this place, endeavouring to recover her; but the search proving vain, he wrote to the magistrate of the district, requesting that he would send some of his people into the woods to look after her. Upon his arrival in Calcutta, he received a letter from this gentleman, to say that the cat had been found with two kittens, in a very lean condition, and was being taken care of at the house of one of the Zumeendars, or farmers. A tent-pitcher, one of a class of servants not wanted in Calcutta, was immediately dispatched to bring down this interesting family; the distance he had to travel was about six hundred miles, and to go there and back on foot necessarily occupied some time. The claihshee, however, thought nothing of it, but as it would have been *infra dig.* in him to carry the cats, a man was hired stage by stage to bring them down. Upon their arrival, Tarty, so far from having grown wild or forgetful, fell instantly into her old habits, showed great joy at seeing her master again, and immediately established herself in her usual place upon his desk, leaving him just room enough to write. One of her kittens resembled herself, but the other showed signs of degeneracy. It had not

been my intention to pet another cat, but as this poor thing wanted a home, and had no beauty to tempt any one to steal it, I gave it an asylum. It soon became exceedingly attached to me, and was just as docile and good-natured as its predecessors had been.

Ill health obliging me to return to England, and not knowing how I should be circumstanced upon my arrival, I did not like to take a cat with me that was not handsome enough to conciliate strangers in its favour. The family with whom I resided, and some friends at the next door, for I was then living near Government House in the city of Calcutta, were desirous to have it for a pet, and, therefore, I left it behind. The first letter which I received, gave me a melancholy account of my poor favourite. I was told that it missed me almost immediately, and became inconsolable for my loss. After wandering about, apparently in search of the person who had showed it so much kindness, and refusing to be comforted by the caresses of others, it went away and was seen no more; deserting all its accustomed haunts, and thus showing that it was capable of a stronger attachment to persons than to places. Since my return to England, I have been much interested by the intelligence and sagacity of a cat that I found with a family with whom I have resided; it was not very well treated, and I was at first under the necessity of purchasing food, and feeding it by stealth. Puss comprehended in an instant all my manoeuvres for this purpose; coming to me immediately as it heard me speak to a parrot in a particular tone of voice, and eating silently and quickly, dispensing afterwards with the usual parade of licking the chops, an operation which it performed with great dispatch, and without incurring observation. This cat, if accidentally trodden upon, or injured in any way, will turn round, and cast a most reproachful look at the offender, uttering at the same time an upbraiding cry, but never dreams of biting or scratching, and may be handled immediately without danger. In consequence of my interposition in its favour, it now leads a very easy life; and its intellectual faculties have been so strongly developed by familiar intercourse with rational beings, that, according to the common phrase, it does every thing but speak.

A FEW STATISTICS OF CRIME IN ENGLAND. REPRESSION.

THE existing means for the repression of crime in England are exceedingly imperfect. Except in a few places where an efficient police force has within these few years been established, the constabulary is weak, and in nearly all cases of emergency powerless; the local magistracy are also in too many instances unfit to exert the full energy of the law; and the duty, trouble, and loss of prosecuting offenders, are left to the discretion of the private injured persons. The whole existing system, with the trifling exceptions mentioned, is little advanced beyond what was in operation at the Norman conquest: the experience of eight hundred years in criminal jurisprudence and correctional police has gone for nothing.

On a subject of so great importance as this, facts are of infinitely greater value than declamation. The first fact, then, which we shall take the liberty of producing, is the very wonderful one, "that there are at present upwards of five hundred voluntary associations throughout England for promoting the apprehension and prosecution of felons, besides very numerous voluntary associations, in various parts of the country, for the repression of vagrancy and mendicancy." (Report, p. 185.) In consequence of the inability of the law and its functionaries to protect the lives and property of the people, the people have been under the necessity, and at the expense, of protecting themselves. What a state of things does this single fact disclose! These associations exist chiefly in the rural districts, and are composed of country gentlemen and farmers. Each member pays so much annually to defray expenses; and among some of the associations there are rules for mutual insurance, by the payment of a part of the loss sustained by depredation; in several of the associations of farmers, there is a rule binding the members, in the case of horse-stealing, to take horse and join in pursuit of the thieves upon alarm of a theft having been committed. In many country parts of England there is no safety for property out of these useful protection societies. The farmer who refuses to join an association, trusting to the law, is a marked man among the various tribes of vagrant and settled thieves. Depredations are committed without fear upon his property, the depredators well knowing that, even if they be detected, the poor victim has not the means, and may not be desirous of taking upon himself the odious function of prosecutor. There is,

* First Report of the Commissioners appointed to inquire as to the best means of establishing an efficient constabulary force in the counties of England and Wales, 1839.

on the other hand, a salutary dread among thieves of the potency of a protection association. They know that the association will spare no trouble or expense to apprehend and prosecute the thief who plunders the property of any of its members, and, moreover, that it incurs no odium in performing this important public service. The insecurity of machinery and other property in some of the manufacturing towns, has introduced the use of fire-arms for self-defence, and the mill-owners were lately "considering of the formation of armed associations for self-protection." On this the commissioners are led to remark, that "if the principle of self-protection were thus generally adopted, which appears inevitable where due protection is not publicly provided, we need hardly specify the serious inconveniences which are to be apprehended from each manufacturing town being rendered a sort of fortress, held by undisciplined troops, infected by local animosities."

One of the most flagrant evils of the present system, is the variety of opposing arrangements in the different towns and counties. Each place has its own kind of jurisdiction and mode of action, and sometimes there are several jurisdictions acting in opposition to, or regardless of, each other in the same town.

"Thus, in Manchester [during the day] the police officer is the proper officer to receive the custody of persons charged with the commission of offences. During the night the watchman, a person belonging to a distinct force, is the proper person to perform that duty. These forces are under separate direction. In the jurisdiction of one corporation there were recently constables appointed by the parishioners, and serving in their 'own right,' that is to say, gratuitously and reluctantly; there were deputy constables appointed by the constables, and eking out their payments by casual fees; there were parish watchmen for the night, and street watchmen, maintained by subscription, and private watchmen, maintained by individuals for their self-protection; there were beadle appointed by the parishes, and beacles, as well as constables, appointed by the wards; there are also paid officers of several descriptions appointed by the aldermen or the common council. These several descriptions of officers, appointed by independent jurisdictions, were practically independent of each other, and they were commonly inclined to prove their independence by thwarting each other on all occasions where offenders to be pursued were concerned with different subdivisions."

Wheresoever a well-appointed police force has been established, and the old inefficient watch been abrogated, a very sensible improvement has taken place in the condition of society. Within the district of the metropolitan police force, every description of property is more secure than it was when the antiquated parochial watch system was in operation. The streets can also now be walked at all hours with both safety and tranquillity. The new police force has rendered other important services:—"From returns extending over the last three years, it appears that the metropolitan police have stopped upwards of 150 fires at their commencement, and have saved 90 lives, whilst only nine were saved by other persons." In Liverpool, a similar advantage has arisen from the employment of a proper police. The superintendent states, that "the police force of that town comprises also a fire police. A certain number, forty constables, are drilled as firemen; there are no other firemen in the town; there are eleven engines all under my care. The advantage of having a fire police within the police force is very great and apparent. The average annual loss for eight preceding years was £400,000: it will not this year, I expect, exceed £10,000. Formerly a single fire cost £400 or £500, now it costs only a very few pounds. All this is owing to the policemen being firemen, and to our new regulations at fires."

No part of the evidence laid before the commissioners shows so forcibly the present state of insecurity of person and property, from the defectiveness of the rural constabulary, as that given by commercial travellers with respect to the danger of travelling after nightfall in certain parts of the country. Mr Thomas Burt, a straw-hat manufacturer, residing in Holborn, who has been accustomed to make journeys as a commercial traveller for ten years, gives the following statement of his experience:—

"What part of the country do you consider the most dangerous, or the least safe to travel?—Of my own knowledge I may state that the districts in which I and other travellers feel the least comfortable in travelling, are the neighbourhoods of the northern manufacturing towns, as the vicinity of Manchester, where some ferocious highway robberies have been committed. One gang was pursued and broken up. One of the robbers was, I believe, caught and transported. The neighbourhoods of Bury, Preston, and Rochdale, are felt to be very bad. A savage murder was recently committed on a foot traveller in the vale of Todmorden, the road to Rochdale. Another murder was committed, for money, on a foot passenger near Bolton. There are two roads, one over Blackstone Edge, the other through the vale of Todmorden, through neither of which, I apprehend, would any traveller, under any circumstances except those of the most pressing emergency, venture after dark. The character of the lower classes in those neighbourhoods is barbarous to an unusual degree. The lower classes in the neighbourhoods of Dudley and Wednesbury are almost as barbarous; but I have not heard of the like instances of robberies and violence having been committed there."

Are the places you mention destitute of the protection of any police or patrol?—In the immediate neighbourhood of Manchester they have a police, but I am not aware of the existence of any in the other places.

Have you travelled abroad?—Yes, I have travelled as

a commercial traveller on the continent, principally through France and Belgium. I have been in Spain, but I have not travelled much there. I am, however, much acquainted with travellers in Germany.

What do you commercial travellers find to be the comparative state of security of the roads on the continent and England?—I can have no hesitation in stating that on the continent the security is much greater. It is, within my own knowledge, much greater on the roads on the continent over which I have travelled. The many German travellers with whom I am well acquainted have stated to me that in Germany robberies are scarcely ever heard of, and Prussia is marked as a country free for the traveller. In some parts of Italy, and in Spain in general, the roads are stated to me, by commercial travellers, to be nearly impassable. In Tuscany, however, there is a good government, and there is a very perfect freedom for commercial travelling from the oppression and terror of robbers. England, in respect to the state of the roads, follows next after Italy and Spain."

Mr Lindsay Cole, a traveller during six years, is next examined:—

"What is your experience as to the state of security or insecurity of the roads in Yorkshire?—A large proportion of it is as desolate and bare of protection as Salisbury Plain; and I found travelling there with money or with any thing valuable, attended with danger. I cannot give a better conception of the state of insecurity than by the fact, that the farmers in the neighbourhood of Leeds frequently waited for each other's company, to return home after the market. I have dined at the market tables at Pontefract, Howden, Selby, &c., and have observed a wish on the part of the farmers, especially after dark, to get company to go home with, and several times have they availed themselves of my lamps, more particularly when they have received payment for their corn or wheat sold. I have seen the same at other places. I have known commercial men to travel on horseback as a more secure mode than travelling in a gig, and I have adopted this mode myself. In some parts there is great difficulty in the transmission of money. I have had in my possession two or three hundred pounds of gold, or notes or paper only negotiable within the district. When I have been travelling with such sums, I have more than once thought that, had I been attacked, I should have stood but little chance of saving my money, or of recovering it afterwards.

What description of force do you believe would give confidence and freedom to travellers under such circumstances?—A police like the metropolitan, on which one might rely in case of need."

We do not require to produce further proof of the existing insecurity to person and property in those parts of England destitute of a regular police force. After the most searching inquiries into the existing state of the general constabulary arrangements in all parts of the country, the commissioners arrive at the following conclusions, which, in all likelihood, will form the basis of a bill in parliament:—

"1. That, as a primary remedy for the evils set forth, a paid constabulary force should be trained, appointed, and organised on the principles of management recognised by the legislature in the appointment of the new metropolitan police force.

2. That for this purpose an application in writing, under the hands and seals of a majority of the justices assembled at any quarter-sessions of the peace for the county, setting forth the insecurity of person and property, and the want of paid constables, the commissioners of police shall, with the approbation of the secretary of state for the home department, direct the location of such constables and such officers as may, upon examination by the said commissioners, be deemed adequate for the due protection of life or property within the county.

3. The force shall be paid one-fourth from the consolidated fund, and three-fourths from the county rates, as a part of the general expenses of the whole county.

4. That the constables so appointed shall report their proceedings to the justices of the peace of the quarter and petty sessions where they are stationed.

5. That the superintendants shall be subject to dismissal upon the representation of the justices of the peace in quarter-sessions, and that the sergeants and constables shall be subject to dismissal upon the representation of the justices of the peace in petty-sessions.

6. That the justices of the peace shall frame rules and regulations for the service of process and attendance at petty or quarter sessions of such force, which rules shall be submitted to the secretary of state, and, if approved by him, shall be binding.

7. That the commissioners shall frame rules and regulations for the general management of the police, which rules shall, on the approbation of the secretary of state, be binding.

The principles embodied in our recommendations being based on extensive experience, we feel confident that however they may for a time be impeded by adverse interests, those interests, and the prejudices engendered by them, will yield before the light of future experience, which will lead to the ultimate adoption of measures on the principles of those we propose. If one uniform and trained force be efficiently directed to the prevention or repression of crime, we cannot doubt of success."

This projected reform of the constabulary system of England will, we can easily foresee, meet with much opposition. The rural gentry will probably oppose it as tending to diminish their personal consequence: others will exclaim against it as part of that centralising system which they dread as something calculated to

become an engine of over-"strong" government. It will be curious if the English people, for such reasons, shall prefer submitting to systematic spoliation for ever and ever, to sanctioning the establishment of the only kind of instrument that ever can be efficient for the protection of their property.

LINES SENT WITH A "FORGET-ME-NOT."

Emblem of my Fanny's eye,
Dyed with empyrean hue,
Bright as heaven's sunshine sky,
Divinely, beautifully blue.
Emblem of my Fanny's mind,
Resplendent, modest, rich, and pure,
Like that brilliant gem we find
All radiant, though at first obscure.
Emblem of my Fanny's heart,
But what to that can I compare?
All that heaven could impart
Of woman's worth, is perfect there.
Go, lovely flower! to Fanny go!
And tell her absence ne'er can blot
From mem'ry her loved image—no!
And, flower, bid her "Forget-me-not!"

E. R.

INSTRUCTIONS FOR EXECUTING A WILL IN ENGLAND.

As the law relating to wills in England has recently undergone some important alterations, which, if not generally known, or not strictly complied with, may lead to serious consequences in the cases of wills made by inexperienced persons without proper professional assistance, the following brief instructions as to the execution of wills have been drawn up under the impression that they may not prove altogether useless.

The recent act passed respecting wills, 1st Victoria, chap. 26, prescribes no particular form in which a will may be made; it is therefore only necessary here to explain the formalities which are required to be gone through with respect to any writing intended to operate as a will, before it can become valid and effectual in law.

1. Every will, then, to be valid, must, first of all, be in writing. No stamp-duty being required, it may be written upon plain paper or upon parchment, but plain paper is now in almost universal use among the members of the legal profession in England. After a seal, made either of wax or of paper, has been attached by the testator to the foot of the document (if the seal be of paper, it may be attached by means of a wafer), the will must then be signed by the testator, opposite to such seal, in the presence of two witnesses at least. If he cannot write, or is unable to do so, it must be signed for him "by some other person in his presence, and by his direction." The persons before whom the will is signed, must then attest the execution of it by the testator—that is to say, they must sign their names thereto, as witnesses, in his presence, and in the presence of each other. Two witnesses are now quite sufficient in every case, without any reference to the kind of property devised by the will. Formerly, in the case of real property, three witnesses were requisite, but two are now sufficient, whether the property be real or personal. This uniformity in the number of witnesses to a will, without any distinction being made as to the nature of the property bequeathed by it, is an excellent feature in the new act. The old practice of requiring three witnesses in case of real property, and two in case of property of a personal kind, led, in numberless instances, to serious consequences, and much expensive litigation.

2. Any person capable of understanding the nature and meaning of the transaction, may be a witness to a will, without reference to age or sex. The testator, however, must take care that neither of the attesting witnesses, or the wife or husband of such witness, be in any way beneficially interested in the will; otherwise, the person so interested, will, by acting as a witness, be debarred from taking any legacy or devise under it, though the will, in other respects, will not be nullified thereby. An executor, however, may now be an attesting witness, without in any way affecting or invalidating his appointment as executor, or the validity of the instrument itself; or a creditor of the testator may be a witness, without forfeiting his claim upon him.

3. In the case of any erasures or interlineations occurring in the will, it is the usual practice for the testator, before signing, to put his initials opposite to them in the margin, and in the presence of his witnesses. But if it be necessary to make any erasures or interlineations in the will after its execution, they must, to have effect, have the signature of the testator, and those of the subscribing witnesses, put in the margin opposite to them; or a memorandum noticing or referring to such alterations, written somewhere at the foot of the document, and signed by the testator, and attested by the witnesses.

Those instructions as to the execution of wills must

be all faithfully complied with, because any omission of the least of them will, under the amended law, inevitably prove fatal to the legality of the instrument.

In conclusion, it may be observed, that the fewer the words in which a will is written, the better.

CHANGE.

Constant change is the first law of society. The world is like a magic lantern, or the shifting scenes of a pantomime. Ten years convert the population of schools into men and women, the young into fathers and matrons, make and mar fortunes, and bury the last generation but one. Twenty years convert infants into lovers and fathers and mothers, render youth the operative generation, decide men's fortunes and distinctions, convert active men into crawling drivellers, and bury all the preceding generation. Thirty years raise an active generation from non-entity, change fascinating beauties into merely bearable old women, convert lovers into grandfathers and grandmothers, and bury the active generation, or reduce them to decrepitude and imbecility. Forty years, alas! change the face of all society; infants are growing old, the bloom of youth and beauty has passed away, two active generations have been swept from the stage of life, names so cherished are forgotten, and unsuspected candidates for fame have started from the exhaustless womb of nature. Fifty years! Why should any desire to retain their affections from maturity for fifty years? It is to behold a world which they do not know, and to which they are unknown; it is to live to weep for the generations passed away, for lovers, for parents, for children, for friends in the grave: it is to see every thing turned upside down by the fickle hand of fortune, and the absolute despotism of time; it is, in a word, to behold the vanity of human life in all its varieties of display.—*Newspaper paragraph.*

HONOURABLE CONDUCT.

In the year 1822, when the manager of the East Lothian Bank absconded, it was found that funds to an immense amount had been embezzled by him, and that in consequence the bank was obliged to discontinue business, and wind up its concerns, in order to effect which very heavy calls required to be made on the partners, for the purpose of meeting the liabilities of the bank. Many of the partners, not being able to settle these calls, were ruined, and the burden thus became doubly severe on the few who have been able to meet all demands. Amongst those who were unable to pay the whole of the first call, was Mr George Waddell, comptroller of customs at Grangemouth, who, after a representation of the circumstances, was finally discharged by the bank, on his paying a composition of the utmost sum which he was then able to command. This gentleman, though relieved by his discharge of all liability for the debts of the bank, nobly resolved that he would not take advantage of this, but would, if possible, compensate his fellow-sufferers for the additional burden thrown on them by his inability at the time to pay his own share. Accordingly, by strict economy, Mr Waddell was enabled to fulfil his intentions, and made payment to all the solvent partners of the bank who were not directors, ordinary or extraordinary, prior to its stoppage, of the additional sum paid by them in consequence of his not having formerly contributed his share of the loss. Grateful for conduct so generous and disinterested, those who became partakers of this unlooked-for benefit presented to Mr Waddell a silver tea-set, and a copy of Calvin's works, in token of their gratitude and esteem. Conduct like this deserves to be extensively known, in order that it may be imitated.—*The same.*

HUMILITY.

Bishop Jeremy Taylor says of humility, that it is like the root of a goodly tree, thrust very far into the ground, and this we may know by the goodly fruits which appear above ground. Of these fruits the worthy bishop sums up seventeen varieties. The catalogue (with slight abridgement in some of the articles) is as follows:—1. The humble man trusts not to his own discretion, but in matters of concernment relies rather upon the judgment of his friends, counsellors, or spiritual guides. 2. He does not pertinaciously pursue the choice of his own will. 3. He does not murmur against commands. 4. He is not inquisitive into the reasonableness of indifferent and innocent commands, but believes their command to be reason enough in such cases to exact his obedience. 5. He lives according to a rule, and with compliance to public customs, without any affectation or singularity. 6. He is meek and indifferent in all accidents and chances. 7. He patiently bears injuries. 8. He is always unsatisfied in his own conduct, resolutions, and councils. 9. He is a great lover of good men, and a praiser of wise men, and a censurer of no man. 10. He is modest in his speech, and reserved in his laughter. 11. He fears when he hears himself commended. 12. He gives no pert or saucy answers when he is reproved, whether justly or unjustly. 13. He loves to sit down in private, and, if he may, he refuses the temptation of offices and new honours. 14. He is ingenuous, free, and open in his notions and discourses. 15. He mends his fault, and gives thanks when he is admonished. 16. He is ready to do good to the murderers of his fame, to his slanderers, backbiters, and detractors. 17. And is contented to be suspected of indiscretion, so he may really be innocent, and not offensive to his neighbour, nor wanting to his just and prudent interest. These, it may be said, are very many fruits to spring from the one root of humility. But this is of so very great and excellent a virtue that it draws with it most others.—*The same.*

LONDON: Published, with permission of the proprietors, by W. & ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

* We beg leave to submit that, beneficial as may be the establishment of a general police force, such as now recommended, there cannot be any thing like the success anticipated, so long as there is a want of a public prosecutor, as in Scotland, to take the place of the injured private party, and encounter the expenses of the apprehension and trial of offenders.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

THE FOLLOWER OF THE FAMILY.*

PART THE FIRST.

MARGARET SHEIL had been born on the estate of the O'Dwyers; and the truth of the legend, which asserted that her father's grandfather or great-grandfather was killed at some famous battle defending the life of Gerald O'Dwyer, "a grate man intirely," was never for a moment doubted by the gentry, or "the people." Margaret was not likely to question its authenticity, for she lived almost always amid the wreck and remnants of the "big house," which had fallen into wretched decay; a sort of authorised follower of the family, tending the lady, a poor weak delicate woman, and cherishing, beyond every earthly thing, a wild, careless, thoughtless youth, the last of a race remarkable (if such a character, being Irish, could be considered remarkable some fifty years ago) for its profuseness and extravagance. The O'Dwyer family had fallen in consequence of this heedless expenditure of a pound, where *care*, with a *shilling*, could have done as much—fallen to the very depths of embarrassment and poverty; and the young man's mother, sickly in mind and body, worn out with the whirling cares and distracting anxieties which a year before had buried her husband beneath their ruins, was not able to think or act. In Ireland, if misfortune falls upon a portion of a respectable house, the distressed too frequently live upon the wealthy, thinking it derogatory to exert themselves; this brings down, sooner or later, the prop whereon they rested, and is both mean and cruel. But poor Mrs O'Dwyer had no prop to lean on; her husband's family having been long before levelled in the dust from the habits to which I have alluded. They had kept open house for years past telling. Poor O'Dwyer, her husband, died in jail; and the mercy of a creditor left the widow and her son the ruined walls of their ancestors, their only shelter against the pelting of the pitiless storm. What had been the garden to the ruined mansion, was, by the positive charity of the tenants who had passed with the land to other landlords, cultivated for her benefit; they managed to find hours or days to sow potatoes and cut turf for "her honour," and treated the wild, buoyant, boisterous lad, who was as free and frank in his bearing as if he were master of the soil, with the respect and attention which they said "they owed the family." It was very touching to witness the various little attentions—small in service, but rich in love—which were heaped upon the widow by the untiring hand of Irish gratitude; and no one was more devoted to her service than was Margaret Sheil. Margaret was a small, active, neat, little body; fair and blue-eyed—eyes so bright and blue, that they seemed to dart into futurity; and Margaret's character was in keeping with her eyes, for she looked forward with a long-headedness very *unIrish*. She was gifted with a much greater degree of worldly knowledge than her mistress. She would even take upon herself to lecture her favourite Garrett O'Dwyer himself whenever he did any thing which she considered it wrong for an O'Dwyer to do. This was not often, for he appeared

to her as near perfection as man could be. Garrett had attained the age of nineteen; could fight like—like an Irishman; sing—like an Irishman; dance—like an Irishman; was thoughtless—as an Irishman; generous—as an Irishman; proud—as an Irishman; poor—as an Irishman! His mother, when he was about six years old, had refused the offer of a relative to take and educate the child, partly because he was the only O'Dwyer who had ever been in trade, and more than partly because her heart clung, as mothers' hearts will cling, to their solace, their hope, their all! Garrett had been long engaged in both open and covert rebellion against petticoat government; wished to go abroad, to enlist, to do any thing rather than remain at home; but when the scoldings and repinings of the mother failed, her tears always triumphed, and Garrett would lay down his gun and take up his flute, the only two luxuries he enjoyed.

His coat was of frieze, and his hat was of straw; and yet there was not a handsomer fellow in the county; he rode admirably; the neighbouring gentry would always lend him a horse, which he was always anxious to borrow, and would have given him as many dinners as he could eat, and, in those claret days, as much claret as he could drink; but he declined dinners almost invariably.

"Masther Garrett dear," said Margaret to him one afternoon, "Misther Grace has sent a gorsoon* over the mountain to ask ye to dine with him to-day. Go, *avick machree*; ye're all as one as a man, now, and ought to go."

"No, Margaret, I'll not go; the food, the meat, would poison me when I thought of my mother striving to swallow potatoes, dry potatoes, here in these ruins."

"That's kind of ye too, Masther Garrett dear; but, darlint, sure it's better to have the paytees dry than wet, any way. Maybe the sand will turn!"

"When it's run, all run," replied the lad; "but I can't stay here much longer, at all rates."

"Nor wont be needed, Masther Garrett," said Margaret; "I wanted to break it to you, *avick*, and didn't know how, rightly. *She'll not be in it many weeks*; so don't cross her by contrayriness, any how; don't." The truth startled the youth; he was unprepared for it; he could not speak; and Margaret Sheil turned away muttering, "The craythur! them menkind never likes to let each other or the women see their tears."

She had said the truth; in another week, Garrett saw, and told her that he saw, the fearful change, and yet, strange to say, he absented himself from the place. This astonished Margaret, who knew how much he loved his mother, and how much he had been ready to sacrifice for her; the poor lady had become almost unconscious of passing events, and yet Garrett had not returned.

Now, Margaret was in agony lest she should die without leaving her son her blessing, and dispatched many messengers to seek him, but in vain. Mrs O'Dwyer had passed some hours in that state of inanity which foreruns death; the heaving of the poor worn chest, the occasional sighs, the rattle in the throat, had increased as the night closed; the wind hissed through the crevices into the chamber of death, howled its mad revels in the dilapidated hall, and rushed furiously through the passages and up the chimnies. Margaret had taken off her apron to prevent the light being extinguished, and pinning one end of it to the bed-post, fastened the other to a chair. The priest had given her the last sacrament, and Margaret ever and anon, when the body heaved with a convulsive movement, brought the crucifix to her lips

and repeated a prayer. The neighbours, who had watched with her to near midnight, returned to their cabins, save one old woman, who slept soundly in a corner on a chest. Again the lady heaved and moaned.

"Oh," exclaimed Margaret, "that the Lord would but send her her child. She'll never have an easy death till she sees him!"

"I am here," whispered Garrett, stealing through the darkness; "here I am!" The young man's face was pale and haggard; large drops stood upon his brow, his beautiful bright hair hung around his face. Margaret uttered an exclamation of surprise, and they conversed in an under tone for a moment or two, and then with strong emotion the young man threw himself upon his mother's bed, calling to her in the most piercing accents to bless and forgive him. Nature was strong within him; he shed bitter and abundant tears over his dying parent.

The poor lady could not speak, but a faint smile irradiated her features for a moment; twice she smiled on him, and placed her hand upon his head; he felt her fingers rest upon his brow like icicles; he laid his cheek to hers; a breath cold and chill passing from her lips made him start; the fingers no longer pressed; they stiffened amid his hair.

"I knew," said Margaret, while tears coursed each other down her cheeks, "I knew she'd never make an easy death till she saw ye."

"Margaret, Margaret," whispered Garrett, when he could articulate, "leave her for a few minutes with others, and come with me. Grace, and Stacey, and many of the neighbours, are watching about the ruins to be of use; I saw them as I stole past. Come with me, for God's sake, or I shall go mad!"

Garrett almost dragged Margaret Sheil from the chamber of death. She had stifled the cries which the poor Irish send forth, and which disturb the quiet of the solemn scene; but when the watchers entered, their cries shook the old walls and mingled with the howling wind.

"What call can I have to your room now?" said Margaret, as she climbed up the ruined stairs leading to a small turret-chamber he called his own. "Sure the bed has been made, and not touched for more than a week."

Garrett made no answer, but strode to the bedside, paused, turned round, looked at Margaret, and then slowly moving down the coarse coverlet, the woman, to her astonishment, saw a new-born sleeping infant.

"Mother of mercy!" she exclaimed, "whose is this?"

"MINE!" was the astounding reply. "The child is MINE."

"Yours, Masther Garrett, yours! The Lord be about us! Sure it isn't in earnest you are!"

"God help me, and keep me my senses," he answered; "I am in earnest; the child is mine."

"And its mother?"

"Again," replied the youth, "God help us all! Its mother and its grandmother are both corpses this woeful night. Its mother—so young—so—so—Oh, Moyna, Moyna, what you suffered for me!"

Margaret Sheil stepped back from gazing with that tenderness which only women feel towards the little undefined-looking heap of infant helplessness, that seemed unconscious of its own existence, and repeated, "Moyna—what Moyna! Not Moyna of Ferry Barrett, on whom shame has lain heavy for the last three months! Oh, not that young, sweet girl! Oh, Masther Garrett, if you brought Moyna of Ferry Barrett to sin, and shame, and death, the Lord had need look down on ye, for your sin is scarlet."

"Listen to me, Margaret," he said, sadly; "I did

* I have been occupied for some time in illustrating at length, in a novel called "Marian, or a Young Maid's Fortunes," the strong and enduring fidelity of an Irish nurse. When the above story of the attachment of Margaret Sheil was related to me, it struck me as another instance of the beautiful faithfulness I have endeavoured to pourtray in the character of Katty Mac-Kane, in the work to which I refer. It gives me pleasure to record a new example of a virtue for which I hope my native land will long be justly celebrated.

not bring her to sin or shame—we were married by Father Myles."

"Father Myles!" repeated Margaret contemptuously; "Father Myles indeed!—a runaway Roman! a half friar! a couple-beggar! nothing more nor less. Father Myles's marriage isn't worth a traneeen, that's what it's not; and sweet and purty as Moyna was, she was no match for an O'Dwyer!"

"I knew my mother would never consent. The poor girl sent for me when her trouble came on her; and oh, Margaret, but I have suffered—the abuse of her people—the agony of hearing she must die. And when she did, after placing the baby in my arms, her father cursed us both, and turned me—me, Garrett O'Dwyer—as a dog from his door!"

Margaret clasped her hands.

"Think what I've gone through! I shed no tear for my bright-eyed girl that I loved, and who loved me, by stream and hill and valley, ever since we met, before we knew what love was, before it had marked us to break our hearts: to see her die, and she not all out seventeen—to be hunted like a wild dog from her corse—to come here—to catch the last breath of my mother—oh, Moyna, Moyna, I could not cry for you! my sorrow was too deep for tears to soothe it. Her father would have murdered me, but her mother saved me, when I had not power to save myself; and then I would have my child. I can't tell you how I got off; I only know that I covered it close in my bosom, that I did not heed its cries, that I brought it to you, Margaret; and that I ask you, in the name of her whose eyes you have just closed, to look to that child, to be a mother to it. The blood of the O'Dwyers is in its veins, and you have been a faithful *'follower of the family'* since you were born."

"May the Lord look down on me, as I am," she replied, falling on her knees. "Maybe it'll be for luck after all. Oh, why should I be talking of luck, and this heavy trouble in the house! Och, my grief, to think of it! Oh, Masther Garrett, you war desperate 'cute—but what has it done for ye! The baby's an O'Dwyer, sure enough—just the nose and the mouth; it's a noble fine baby. Oh, thin, Masther Garrett, I can thank God the mistress didn't live to know this last turn; you married by a couple-beggar to Moyna of Ferry Barrett, and her people—the likes o' them insulting an O'Dwyer; oh, that's what comes of young men wandering over the country! The poor mistress!"

Margaret, or, as she was usually called, Marg'ate, went on talking, forgetting for a moment the dead in the living. Garrett looked on his child for a little time, heedless of her words. There was an expression upon his countenance as if ten years of sad and harrowing trouble had been added to his young life. Earnestly did he look at the infant, as if anxious to impress its features on his memory, then turned away without another word, and left it to the care of the faithful follower. The little helpless stranger woke and cried; Margaret found that it was loosely wrapt in flannel and shawls; before she attempted to return to whence she came, she fed and warmed it, talking to it all the time, and determining that it should be called Evelyn, after the grand lady of the family. This arrangement passed rapidly through her mind, but the good creature was sadly perplexed between sorrow and anxiety. At last she determined to leave the sleeping babe, and return to perform the last duties towards the mistress. "The neighbours," that is, the poor, were scattered through the house, lingering till they should be admitted to take a "last look at the mistress;" the women in the chamber were waiting till the *"follower of the family"* came to give the necessary directions—which, as there were no female relations, she was expected to do.

And Margaret performed her task with extraordinary command over the feelings, which at any other time would have overpowered her; the frigid limbs were decently arranged, the drapery folded, the candles lit, the water sprinkled, and then Margaret began to wonder where the young master was. Daylight came on stealthily, as if unwilling to look on the destruction of the night; but it *did* come, and she sought him every where in vain. That Garrett should leave the house at such a time, was a matter of astonishment to all. The women said that he had entered his mother's room, and one had seen him kneeling by the corpse, and another heard him weeping. It seemed very evident, however, that he was *gone*; and what increased the mystery was, that no one had seen him depart.

Margaret knew not what to do. There was something unnatural in permitting his mother's body to go unattended to the grave; something so shocking in

the idea of his deserting his child, that the humble follower could only wring her hands in bitter sorrow. Another matter was also to be considered; there were no means to lay the remains decently in the earth. The priest, Margaret knew, would go without his dues, for the sake of the family; the carpenter would make the coffin—not because he had ever been employed by Mrs O'Dwyer, but for the sake of the family—but then he could not give the timber, because he had none to give. This difficulty, however, was obviated by the suggestion that enough of planks could be raised from the flooring of the rooms, which was accordingly done. Some of the more wealthy of the humble class sent *"presents"* of the materials supposed at that period to constitute the respectability of an Irish wake. And the poor lady was followed to her grave not only by the followers of the family, but by many of the gentry, who at that time never neglected to keep up the credit of their *caste* at a funeral. The morning (the third after the poor lady's death) appointed for the ceremony was chill and dreary; the mist lay low upon the mountains, and the scream of the eagle, and croak of the ancient raven, sounded through the filmy clouds. The procession was large, some on horseback, some on foot; two *keeners*, whose ancestors had keened the O'Dwyers time out of mind, attended for the honour of the family; they crouched by the side of the coffin, and ever and anon sent forth their lamentations that the "lady had left her country," spoke of that son who had deserted the last duty he could perform towards his mother, and recounted, in wild disjointed stanzas, the heroic deeds of gone-by times, when the O'Dwyers had "more land of their own than the eagle could see from the top of Shine-granagh," when they had horses to carry their faction to battle, when their name flamed through the country like lightning, when every eye that saw blessed them, and their voice was as the sound of music to the country; but now the wind rattled where the wine had flowed, the hard-headed and hard-hearted possessed their land, and there was no one to shed the *heart's tears* upon the grave of the poor lady, but "the follower of the family."

There was, however, another of whom the keeners knew nothing; the little helpless infant whom Margaret had concealed beneath the folds of her cloak, so that the poor lady, her mistress, might have some one of her own blood to see her in her grave. Margaret Sheil having performed this last duty, as she had done all others, with zeal and fidelity, bethought her that in a day or two she must leave the ruin which could hardly afford shelter to any but the wild owl or chattering jackdaw. The keeners at her lady's funeral had stigmatised as hard-headed and hard-hearted those who had honestly possessed the land which the O'Dwyers had wasted, but Margaret knew they did not deserve the blame, and after removing what few things were left by the spoiler Time, she prepared to depart to the house of a younger brother, where she was much needed, as the poor fellow had lost his wife. He lived in a neighbouring town, and it was with regret that Margaret exchanged the freshness of the air and wild sweetness of the fields for the noise and vapours of a congregation of ill-built dirty houses. The night before she quitted the last seat of the O'Dwyers, the maternal grandmother of the little baby came stealthily to the ruins, to look upon her daughter's child. Her husband, she said, prayed that it might die; but she forgave her poor girl; she believed she had been a wife in the sight of God, and that was a comfort to her. She threw some light upon the disappearance of Garrett; he had become linked in his wanderings with some mountaineers, who plotted treason deeply and dangerously. Garrett's superior intelligence and address made him a sort of leader amongst them, and two of the party having been arrested some time before, the military were on the look-out for Garrett, who, she said, her husband believed had quitted the country. Margaret consoled herself with this intelligence. "He did not desert us from choice; I knew he did not—I knew he did not," she repeated to herself, and the secret and unworthy marriage, the reckless and imprudent daring which made him link with dangerous characters, seemed as nought in the eyes of "the follower of the family." Now convinced that Garrett had "not deserted them from choice," all his folly, all his thoughtlessness, were forgiven.

"I often told the mistress," she said, "that she was trying to rein in a red-deer of the hills with a rope of sand."

The poor bereaved widow departed with many tears, which Margaret was particularly careful should not fall on Evelyn's face, deeming it not lucky, as she said, "that the salt of a tear should fret its tender skin for the first three months." Her brother, it must be remembered, was one of the same clan; and though he had two little ones of his own, he welcomed the infant brought by his sister with an humble affection most touching to witness.

"It has the blood in its veins of those who sheltered our forefathers, and we should not want if they were to the fore, as in old times," said the man; "neither shall it want love, duty, or respect, while I have a bit to give my own. Tache them to sarve it, Margaret; sure its being with us doesn't make it like us; it's an O'Dwyer, God bless it."

Murtoth Sheil avowed that "the young lady," as he always called her, "brought a blessing to his 'four walls' from the day she entered them—every thing *thru* so."

This was true; the Almighty blesses us in this world for our good deeds; but Margaret's right thinking, industry, and cleanliness, was also a blessing of magnitude, and "Murtoth's sixpence went as far as any one else's shilling." This was evident to all, and the little babe acquired the happy second name of "Blessed"—the blessed Evelyn—from her poor neighbours, whose affectionate attentions entitled them to the epithet of friends.

THE TEMPERANCE MOVEMENT IN AMERICA.

[The following paper has been prepared for the Journal by Mr E. C. Delavan, of New York, first secretary of the American Temperance Society. We cordially give it a place, because we believe that the Total Abstinence system is doing much good, and that all friends of their species are called upon to countenance it. We are also humbly of opinion that the movement here described has no small interest as a fact in the moral history of mankind.]

PREVIOUS to the commencement of the temperance reformation in the United States of America in 1826, ardent spirit was in common use in almost every family, and was generally considered as a healthful beverage, and, when used in moderation, injurious to none, and indeed essential to the labouring man.

This opinion regarding the nature of ardent spirit, together with its low price—enabling a man by the labour of a few hours to procure sufficient to keep him intoxicated for days—produced the most mischievous effects on the community, and came near to realising the character given them by a distinguished traveller, of being "a nation of drunkards." Even while this beverage still retained its place on the sideboard of the wealthy, as well as in the houses of the poor, thinking men could not avoid feeling alarm at the melancholy fact constantly presented to them, that great numbers of men and women had already become drunkards, and were daily becoming drunkards, useless to their families, and burdens on the public. Good men began earnestly to preach against intemperance, and press the necessity of moderation in the use of that which even they themselves considered in moderation a good thing. It was the conviction that no moderation, however strict, in the use of a thing in itself essentially bad—as they by degrees discovered it to be—could remedy the evil, which forced them to take a more decided course; and a few patriotic individuals of the state of Massachusetts, who had met at Boston early in 1826, to consider the evils and remedy of intemperance, after a careful examination of the whole matter, felt themselves constrained to declare, that, "in their opinion, the only sure remedy for the evil was total abstinence from the article which occasioned it." This was the origin of the American Temperance Society.

It was very soon perceived that a vast work was to be done, and that a judicious division of labour was absolutely necessary. The friends of the cause, therefore, each devoted himself to that branch for which his present circumstances, and previous habits, had best fitted him. Some of their earliest efforts were directed to the *collecting of facts* illustrative of the effects of ardent spirit on all classes and conditions of men, and some of the first talent of the country was devoted to the inquiry.

Benjamin F. Butler, Esq., attorney-general of the United States, having retired on purpose from his professional duties, engaged himself for several weeks in the investigation of various documents, which resulted in a conviction that the United States were then suffering a *yearly loss in money* of at least one hundred millions of dollars by the use of ardent spirit alone. This statement he published, together with the authorities and calculations on which it was founded; and diffused as it was in religious, political, and temperance papers, it produced a mighty effect in directing public attention to the subject as a question of political economy. Perhaps no single effort has resulted in more good.

About the same period, or shortly after, Mr Samuel Chipman, an individual peculiarly qualified for the collection of statistics, was employed for nearly two years, at the sole expense of a friend of the cause in the state of New York, to inquire into the individual history of every pauper in the workhouses, and also of every criminal in the jails, in that state (being fifty-six of each), and to make the like inquiry in the state prisons, the penitentiaries, the orphan asylums, and other establishments for the depraved and wretched. No labour or expense was spared by him in collecting the information; and so careful was he to verify it, that he always obtained certificates of the superintendents of the various establishments he visited. The result of these inquiries clearly proved that *three-fourths* of all the crime and pauperism in our state, and the like proportion of local taxation, could be traced, directly or indirectly, to the use of ardent spirit. These facts were published in a pamphlet form, to the number of one hundred thousand, and furnished (for the most part gratuitously) to every leading individual in the Union that could be reached, and in some districts to every family. They were also published, in an abridged form, in tracts, and in various religious, political, and temperance papers, until every individual could, if he pleased, be in possession of them; and although they have been before the public several years, no one has ever attempted publicly to controvert their correctness.

* Above 21 millions of pounds sterling.

On occasion of his fire-experiments, he had a large wooden house erected, and secured by his stucco composition. He subjected this house to various severe trials, and among others to the following, which is here described in his own words:—"I then caused another wooden building, of full fifty feet in length, and of three stories high in the middle, to be erected close to one end of the secured wooden house. I filled and covered this building with above eleven hundred large kiln faggots, and several loads of dry shavings, and I set this pile on fire. The height of the flame was not less than eighty-seven feet perpendicular from the ground, and the grass upon the bank, at a hundred and fifty feet from the fire, was scorched up; yet the secured wooden building contiguous to this vast heap of fire was not damaged in the least, excepting some parts of the outer coat of plaster-work. This experiment was intended to represent a wooden town on fire, and to show how effectually even a wooden building, if secured according to my new method, would stop the progress of the flames, as well as escape itself uninjured." Another experiment on the secured wooden house consisted in filling an under room in it with combustibles, and setting them on fire, when, although the heat was so intense as to melt the glass of the windows like sealing-wax, not one particle of injury was done to the walls or the ceiling, and people could sit down in the chamber above to an ice-cream entertainment, without feeling even any annoyance from the raging furnace beneath. A still more satisfactory proof of the efficacy of Lord Stanhope's fire-preventive was given some years afterwards, when a fire broke out at Chevening, his lordship's fine seat in Kent. Having rebuilt this mansion, he had taken care to secure it by his new method, but a portion of the offices remained accidentally unsecured, and here the flames originated, and burst forth with great fury. On reaching the secured portion, they were stopped at once, and this beautiful mansion was saved from destruction.

Passing over some less important instances of Lord Stanhope's inventive powers, his work (published in 1779) on the "Principles of Electricity" may now be adverted to, as affording testimony of his lordship's capability of grappling with the highest scientific questions. But even in considering this subject, his labours took, as usual, a decidedly practical turn. The mode of protecting houses against the terrible effects of lightning was one point which our noble author fully and experimentally investigated. A dispute was at that time agitating the scientific world, upon the proper shape for electrical conductors. Franklin had recommended long pointed conductors, but the printer of Philadelphia was a man whom some persons in Britain would then not be saved by, either from lightning or any other impending agent of destruction. Therefore, some intensely British philosopher suggested the use of short conductors ending in a ball, and the royal palaces of the country were secured, as was fitting, after this British mode. In fact, the question became in some measure a political one. As might be expected, Earl Stanhope took the side of science and natural truth, heedless whence that truth was enunciated, and demonstrated the superiority of the Franklinian mode, besides giving publicity to many original thoughts of his own on this and other points connected with the subject of electricity.

Navigation and ship-building occupied much of Lord Stanhope's attention at various periods of his active life. Regarding ship-building of the ordinary kind, it may be merely observed that many of his suggestions regarding the proper mould of ships, their bottom-coating, and other points, were extensively adopted in the dock-yards of Britain, and still possess their practical influence. The application of the power of steam to the purposes of navigation was one of his lordship's favourite subjects of speculation, and in concert with him did Fulton the American, to whom Earl Stanhope was a generous friend, enter on numerous experimental inquiries into this great question. In fact, his lordship was individually so certain of the possibility of perfecting this scheme, that he took out several patents in the immediate hope of bringing his views to a practical issue. But, notwithstanding all his expensive modellings, he did not succeed, unquestionably, in actually placing a working steam-ship on lake or sea. If unsuccessful in this pursuit, however, it is undeniable that canal navigation owes much to our noble inventor. His improvements on the locks of canals were of the highest service in that important department of internal intercourse, and to this day their value is practically felt over the whole land.

From Lord Stanhope having passed his whole life in inventing, and in improving or remodelling inventions, it is difficult to affix a precise date to any of his various labours. But it was in very early life—certainly before he was thirty years old—that he invented a calculating arithmetical machine, of the same order as that upon which Kepler spent many long years, though without arriving at the desired perfection; and of a character similar to that of the machine which a later philosopher, Babbage, has at length given to mankind in a complete state. Lord Stanhope's instruments, for in the course of time he constructed several of them, were very wonderful in themselves, and perfect as far as they went, but his lordship clearly saw and admitted that it was possible to form calculating engines of far higher grasp than any of his, and which might, indeed, be almost boundless in their powers. His discoveries in this quarter, however, can-

not be compared to those which he made in the art of printing, though his arithmetical speculations might exhibit his knowledge of theoretical science in a more favourable light. The "Stanhope Press" was a vast improvement on preceding printing-presses, and by this instrument, since his name has been rightly bestowed on it, will his memory go down to posterity, as the creator of an epoch in the noblest of all human arts. He has also been called the inventor of stereotyping, and if this be not the case, he had the merit, at least, of being the great improver of this most important process, which was introduced by him into general use. Another of his lordship's inventions bears the name of the "Stanhope Monochord," being connected, as the name implies, with the subject of music. His lordship possessed a fine musical taste, and published a little work on tuning instruments. His musical, like all his other speculations, were extremely curious and original.

Our space will not permit a further extension of this view of Lord Stanhope's labours as a natural philosopher, although the list of his inventions might be much augmented. It is necessary, however, to the completeness of this biographical sketch, that the remaining portion of it should be devoted to the recording of some features of his lordship's public, and also of his domestic, career. It has been mentioned already, that honesty was his leading characteristic as a statesman, and hence it was that his lordship often found himself standing politically alone, even those who thought with him keeping aloof, because they did not choose always to speak their minds as he did. From this cause he got the familiar name of "the minority of one" in the House of Lords, being so frequently unsupported in his motions. At the time of the French revolution, also, the principles upon which that mighty movement was originally commenced, met with the noble earl's most decided approbation, and even after its bloody consequences had repelled a large body of its early admirers, his lordship continued true to his first sentiments. Rationally considered, this conduct by no means implied an approval of those consequences, but the alarm was then at such a height that men could not consider things rationally, and Lord Stanhope was denounced, by tongue and pen, as a man who approved of a Marat's conduct, and would himself be a Marat under fitting circumstances. Such a degree of odium as this had its effect in separating his lordship from his family, whose guide and model was their powerful uncle, the premier. Lady Esther Stanhope (since renowned for her oriental career), Lady Lucy, and Lady Griselda, the earl's three children by Lady Esther Pitt, and his three sons by a second lady, the daughter of Governor Grenville, all left their noble father's society, and threw themselves on the guardianship of Mr Pitt. The eccentricities which were undoubtedly inherent in Lord Stanhope's character, formed the ostensible cause, at least, of this separation. He hated war, and would have none of his sons soldiers; he adored independence, and wished his junior sons to enter the useful professions, and not to accept of offices, or sinecures, or pensions, or become in any way burthensome to the country. Here the children were at variance with the father. Two of them entered the army, and several of them were endowed with pensions. But on this matter enough has been said, and we may conclude by stating, that the earl remained separated from his family to the last.

Apart from the isolated nature of the position which he usually held in the House of Lords, in consequence of what were then called his extreme opinions, though they are in all respects the same with those now entertained by even moderate politicians, there was a quaintness in Lord Stanhope's manner and matter as an orator, which made him be considered one of the most humorous speakers of his day. His delivery was careless and ungraceful, and his personal appearance did not remedy the defect, his body being tall and lank, and his face wan and thin, with a brow high and bald. Many of his sayings were terse and epigrammatic, and his name is one often to be seen in collections of jests and good things. He lived, such as we have described him, till his sixty-third year, when he died of dropsy, on the 17th of December 1816, at his seat in Kent.

In more respects than it has been found possible to point out in this article, Charles Earl Stanhope merits the grateful remembrance of posterity. Some of the subjects to which he directed his thoroughly practical genius, and the results thereof, have been here adverted to, but one can only guess at the indirect influence which he exerted on the same branches of knowledge by the encouragement of his noble example, and by the generous patronage which he bestowed on many of his poorer fellow-labourers in the same great field.

THE DOGS OF ST BERNARD.

With reference to a late article on the Dogs of the Convent of Mont St Bernard, the following facts of recent occurrence may be here introduced: they have found their way into the British newspapers, through a letter from Geneva.—"A few months since, a band of robbers, attracted by the hope of plunder (for there is generally a considerable sum in the treasury of the brotherhood), and trusting to their defencelessness, made an attempt on the place at night; and finding the doors locked and bolted, summoned the pious garrison to surrender. The fraternity endeavoured to dissuade the bandits from their enterprise by all the arguments which religion could suggest; and finding that their appeal was vain, and that the robbers were about to break through the doors of

the refectory, they let loose their dogs, eighteen in number. If these noble creatures are mild and docile when dispatched on errands of good—when irritated, or urged on in attack or defence, they are fierce and savage as wolves, with which they have been singly known to grapple, and even to face the bear. On this occasion they proved their wonted courage, for when sent forth against worse foes, they each took their man, and notwithstanding a determined resistance on the part of the bandits, killed eleven of them, and wounded the others so severely, that they were left for dead upon the field. Many of the dogs fell victims in the encounter. The good fathers, forgetful of their wrongs after the conflict was over, carried the robbers that survived into the convent, dressed their wounds, and having healed them, sent them away with an exhortation, which, as far as the Convent of St Bernard is concerned, will doubtless be effectual."

ACCOUNT OF THE GREAT HURRICANE IN BARBADOES, IN 1831.

I was staying with a friend near Bridgetown, a part of the island which suffered most dreadfully, if one part could be said to be more ruined than another. The day and evening of the 10th of August presented nothing remarkable; the sun set finely, leaving a very red glow behind. At about eight o'clock in the evening, I was walking with my friend in the open air, and we both remarked the appearance of the sky, which, even then, retained a glow as if from the reflection of an enormous fire; but the air was perfectly calm and very warm. I remember observing to Mr Brathwaite, that "skies such as these were said to presage wind; and if so," I added, "we have a regular hurricane sky to-night." I spoke this in jest, very little dreaming of its unfortunate truth.

We soon after returned to the house, and played several rubbers at whist, till about nine o'clock, when the family retired to rest. All was still perfectly calm, but (I suppose from some affection of the air) I could not sleep. I knew not what to attribute this to, except indisposition; nor did I afterwards find that any one else was similarly affected. I lay restlessly till about ten o'clock, when a dog of Mr Brathwaite's, who had followed me to my room (which he had sometimes but not often done before), started up and came with a violent spring upon my bed, tearing at the same time a large hole in the mosquito net. I was surprised at the circumstance, and, vexed that he should have spoiled the muslin, I being a visitor in the house, hastily drove the dog off the bed. The wind was now rising, but it was as yet nothing—nothing to excite notice. Still I could not sleep, and the gale gradually, almost imperceptibly, increased. About an hour after, the dog again sprang suddenly up, and leaped again upon the bed, tearing the curtain a second time. I found it of no use trying to get rid of him, so let him lie quietly by my side; but the animal was evidently in a state of agitation, and did not sleep any more than myself. At about twelve o'clock the wind had risen to a tremendous height, and I began to feel considerable uneasiness. Presently a copper roofing in an adjoining room was torn off by the gale, and flapped backwards and forwards, making an unpleasant noise. I now got up, and put on part of my dress, feeling very uneasy, and yet not liking to disturb the family, thinking that my fears would only be ridiculed, and that I should be laughed at in the morning for my groundless apprehensions. I therefore returned to bed, still remaining partly dressed, and listened to the storm, which increased fearfully. At length, at about three o'clock in the morning (August 11), Mr Brathwaite came into my room, and told me that he thought I had better get up. "I hope in heaven," he said, "that there is no great cause of alarm; but the hurricane increases most awfully; the hall-door has been forced in, and in case of any thing occurring, it is better to be up and dressed." I immediately rose, and dressing in haste, I proceeded to pile up my trunk, desk, and dressing-case, one upon another, on a chair, clearing the floor as much as possible, because I supposed it probable that the roof would leak considerably. I then joined Mr Brathwaite in the drawing-room. The house consisted of a ground floor, on which this room was situated; a first floor, in which were our bedrooms; and a second floor, which contained garrets, where the wine, &c. was kept. The drawing-room was upwards of twenty feet long. Passing by one of the windows, of which the shutters were closed, I observed how strongly the wind blew through them; I was not at all aware that the glass was smashed to atoms, for the wind was so tremendous that it completely drowned every other sound. I placed my hand against the shutter to feel the current of air, and while I yet held it there, the gale drove the whole shutter, window-frame and all, completely into the room. I tried to replace it, and while I was so occupied, in came another and another window. The hall-door had been before driven open, and soon there was not another door left shut, or a window remaining in the house. There was one door which opened on a flight of stone

steps leading into the garden, and which was approached by a narrow passage, terminating at the opposite end in stairs which led to a garret; while this door was yet closed, I contrived, with the assistance of a servant, to place against it two boxes closely packed with house linen, and of great weight. We then left it.

By this time the drawing-room was so exposed by the breaking in of the windows, that the furniture was driven from one end to the other as though they had had wheels, and had received a furious push; chairs and heavy tables sliding violently about. We quitted the drawing-room, and all made for the chamber which was over it. In this place was now assembled the whole family, consisting of Mr Brathwaite, his two sisters, myself, and a number of servants and slaves, amounting altogether to about twenty persons. The windows were broken in, and the rain poured into the room in torrents. I now proceeded to read prayers to the party, Mr Brathwaite being very old and infirm, and perhaps more agitated by the terrors of the hour. While we were thus engaged, the wine, which was kept over head, was smashed by the falling roof; and being directly over our heads, we felt the shock, though the tremendous roar of the wind prevented our hearing the crash. One of the party now exclaimed, "Mr Hobson, I think the wine has gone; you are kneeling in a pool of wet; I fear you will catch cold." I thought it very strange that the idea of catching cold should occur to a person aware that the roof had fallen in. The floor of the room above us now gave way, and broke the ceiling of that in which we were, so that we could see the sky; the window-frames were gone; and I long tried, but it was in vain, to keep a light burning under a glass shade. We were involved in pitchy darkness, except for the almost incessant lightning, which was frightfully vivid, and made the succeeding gloom more awful; the flashes were so close that the thunder must have been tremendous; but in consequence of the overwhelming noise of the wind, we could not hear a single clap. When the ceiling gave way, a rush was made to the door; but the two or three persons who got first into the open air had their hats and mantles instantly whirled away by the storm, which alarmed the party within; and the cry was then, "Come in, come in, for God's sake! We shall all be killed, but let us keep together!" All now returned, and we stood linked tightly arm in arm together, endeavouring to support ourselves and each other. The floor was now a foot deep of water, the wind blew completely through the room, and, except the lightning, all was completely dark. The time was inconceivably horrible; men, women, and children, screaming and groaning in utter despair, or crying piteously for mercy, endeavouring in that awful hour to make up a short account with heaven—imploping for pardon and pity with the most fearful supplications. No words can give even the most imperfect idea of the horrors around us; not one of us expected to live an hour longer. The hurricane raged till 5 A.M. 11th August, when it began to abate, but so imperceptibly that we could not for a moment trust to its decreasing. At length the day broke. I need not attempt to describe what a blessed relief it was. I am content that during that night there was not one person in the isle of Barbadoes, who in the least expected to see daylight again. I have conversed with many on the subject, and every one has owned that they were in utter despair of life.

We now perceived that the bedroom I had been used to occupy—in short, all the rest of the house—had fallen in, though, notwithstanding their proximity, the wind had prevented us from hearing the crash. I now felt so much alarmed for the remainder of the building, that I proposed that we should tie together the sheets of the bed, and let ourselves down from the window into the open air; but, having remembered the stone steps, we now repaired to them. The wind had burst open the door, and driven the heavy boxes I have mentioned some way up the garret stairs; the force of the current of air in that narrow passage was almost incredible. We went down into the garden, but the wind was still so tremendous that we were obliged to creep down on all-fours, it being impossible to keep our feet. Scarcely a tree was left standing, or those which remained were mere sticks, the boughs completely stripped off; it was wonderful to see huge mountain cabbage-trees, more than eighty feet long, lying every where prostrate. I was told by a young man who clung for refuge to the stump of a newly felled tree, not above ten feet in length, and of great size and strength, that the wind shook it tremendously.

By about 8 A.M. the storm had completely subsided; the day which succeeded was lovely in the extreme; not a cloud was visible, but the air was very close. Mr Brathwaite and myself walked round the estate to see the extent of the damage. The scene of desolation was most horrible; it was as if fire had gone all over the country, which presented a brown and seathed appearance, where only the evening before had been the most beautiful fertility; the wooden buildings were every where levelled. In Coddington College, a stone edifice consisting of a centre and wings, the top story of each of the latter (containing together sixteen rooms) was carried smoothly away. The ground was every where stuck closely over with large splinters of wood, carried by the wind, and driven in so far that a man could not extricate them, and even into trees of hard wood. A poor woman had one of these splinters driven by the wind through both her legs; amputation was necessary, and she died while they were cutting off the second leg. In the fields round the college I observed

whole heaps of dead birds piled together at regular intervals, as if they had been laid there mechanically. The mills, being circular stone buildings, were left standing, and at this late season of the year the sails were all taken down; but the power of the wind even over the bare arms was so great as to set the mills in motion. One man, who had taken refuge in a mill, without the least idea that it was moving, was caught up, and instantly killed.

The effect of the storm upon animals was singular. Every horse, cow, or other domestic animal we met, appeared in a state of utter stupification. Their eyes, ears, and nostrils, were filled with blown marl, dust, and sand, and they seemed to have been completely deafened by the tempest; where they were not in this torpor, madness had been the consequence. Horses, when let out of their stalls, rushed furiously about, and numbers threw themselves over precipices into the sea, or down declivities, where they were dashed to pieces. But the effects on human minds were most horrible of all. Every man felt himself at once utterly ruined; every thing seemed swept away, and starvation stared us in the face. This was dreadful enough, but it was not the worst. In every place were met mothers distractedly searching for their children, husbands for their wives, children for their parents, amidst the ruins of their fallen habitations. The most affecting incidents occurred. Sometimes whole families having taken refuge in their cellars, the entire house fell over, and buried them, and no rescue could be attempted; the survivors were too much engaged in digging among the ruins of their own dwellings, or searching the country for their relations and friends.

The number of the wounded was frightfully incredible; the cathedral and two other churches which remained standing, were immediately converted into hospitals, and filled with wounded; but many persons had received most dangerous cuts and contusions, without being in the least aware of it, so great was the universal terror; and we saw many riding and walking about with alarming wounds, themselves quite unconscious of the injuries they had received. Every face wore a look of heart-rending despair and stupification.

To return to Mr Brathwaite and his estate. I have said that the house was almost entirely ruined. One very small room, in which harness used to be kept, and which was paved with brick, was the only refuge we could find; our only refreshment a cup of coffee, which we did not get till 1 P.M.; and in this miserable place we had to pass the night. We piled together old tables and chairs, and placed on the top some wooden shutters, and this place was assigned to the females, while we disposed of ourselves as we could. Ladies, slaves, and servants, were all huddled together, for of course all form and ceremony was completely done away with: all were on a level of misfortune. Sleep was nearly impossible, and in this comfortless state several nights were passed. Meanwhile, the most alarming reports were every where circulated; at one time we heard that the blacks were in insurrection, and that they had resolved on a general massacre of the white population; at another, that the garrison was in mutiny; and every individual had some affecting tale to tell of his total ruin, his dangers and escapes. (One young man told me how, his whole family and children being assembled at prayers, they saw the whole front of the house fall forward into the street; his wife was beside him, and a heavy piece of furniture falling on her legs, prevented her from moving, and it was by a considerable exertion of force that he succeeded in dragging her out. They then escaped with their children into the open fields, when the wind forced them apart, driving his wife and one child towards an extremity of the field, forcing himself and the others in opposite directions. While he was searching for his companions, a flash of lightning struck him, and he fell insensible; nor was he restored without much difficulty when he was found next morning. On recovering his senses, he went in search of his wife, and then, both together, they looked for the children—all were found in different parts of the plain, completely numbed with cold and rain. The cold during the storm was excessive; but it is a singular circumstance that no one died from the inclemency of the weather, but the slightest wound festered and mortified, so that lock-jaw was continually ensuing; every hour brought numberless deaths. Those whom we had seen the day after the hurricane riding or walking about, quite unconscious of having received a scratch, we heard of the next day as confined to bed with fevers, lock-jaws, &c., which proved fatal in almost every case. Numbers had been dreadfully lacerated in their feet by the broken glass and crockery every where strewed about, and from nails sticking in the shingle, which was blown off the roofs. I heard of one particularly singular death in this way. Two sisters, daughters of a clergyman, left their room together; just as they crossed the threshold, one stumbled and fell, dragging down with her her sister, whose hand she held, and who was unable to rise. When they were found in the morning, the one who first fell still clasped her sister's hand, who, when recovered, conceived that she was in a state of insensibility occasioned by terror, and attributed her coldness to the rain; but the cause was more fatal: she was dead and stiff; two wounds were found, one on the top of the head, apparently produced by a blow from a beam, another at the back of the neck, attributed to a piece of shingle (which was every where flying about), and which, having a

nail through it, had stuck in, and produced instantaneous death. I heard only of one person on the island who had had any anticipation of the catastrophe—Mr Shaughan, who, on the evening of the 10th, was dining with a party of gentlemen: he rose after dinner, and said, "Gentlemen, I would advise every one who has any regard for his property to return home and secure it immediately, for I am certain that a very severe hurricane is approaching; if any one will put his ear to the ground, he will be aware of a very uncommon noise." The company, however, put no faith in his words, and thought him intoxicated; he instantly returned home, and gave orders for securing his property as well as possible; his wife and family also attributed his behaviour to convivial excess, but he, insisting on obedience, saved much of his possessions.

We now began to clear away the rubbish, and found a great deal of our property, but broken (or, as the Barbadians expressively say, *maashed*) in pieces, and on Saturday we enjoyed the relief of clean clothes and water, Mr Brathwaite and I performing our toilette at a pond, resigning, of course, the room to the ladies. On Monday I went to the town, a distance of about ten miles, and was constantly obliged to use a bottle of salts, for dead animals and birds were lying in numbers on the way, and the air was in a dreadful state with their putrefying carcases. It was wonderful that no plague ensued. During this day's ride I saw numbers of persons who were obliged to take refuge in the marl pits, &c. with no covering but an old umbrella, in the most extreme state of wretchedness.

The manner in which the houses in the town were rent, was exceedingly curious, and seems to countenance the idea that an earthquake accompanied the storm. Among the strange objects observable in the street, was a large block of mahogany, which the wind had carried from the quay some way up the street: I say the wind, for though the sea rose considerably, it never advanced far enough or in nearly sufficient depth to float the block to where I saw it. In like manner the wind had blown the ships completely out of the water, and laid them high and dry; the sailors made no attempt at resistance, but remained quietly on the beach in a very snug shelter. It is said that the sea was very much agitated before the wind came, but I was not near enough to the ocean to confirm or deny the assertion. An army ship being near the island, stood off and on during the night, and in the morning ran into the bay; she perceived immediately what was our state, and instantly made for the other islands, to give notice that Barbadoes was in ruins. In about eight days, supplies began to arrive from the other islands. Our fears of famine were ill founded, for the corn, though damaged, was almost ripe, and was thrown in heaps, and still quite available. £100,000 was granted by England for our relief, £75,000 of which was allotted to Barbadoes, the rest to St Lucia and St Vincent, which, however, suffered nothing in comparison. A very large subscription was also raised in England, and happily the crops had been shipped off before the hurricane occurred. The deaths were about 1700 in a population of 100,000.

It was surprising to see how soon the buildings were raised again; in three months the island looked quite restored, for there was much rain, and the weather altogether was very favourable for vegetation.

NAN CLARGES, THE BLACKSMITH'S DAUGHTER.

THE famous George Monk, afterwards Duke of Albemarle, and the chief agent in effecting the Restoration, was in early life an officer in the service of Charles I., when that monarch was engaged in contention with his Parliament. While in this employment, the fortune of war threw Colonel Monk into the hands of the adverse general, Fairfax, by whom he was sent to the Tower of London. Here he lay for two years, choosing rather to endure all the rigours of confinement and poverty, than to accept the inviting offers made to him by the anti-royalist party, to whom his military abilities were already well known. In fact, George Monk would probably have fallen a victim to the severities of his fate in the Tower, but for the assistance which he derived from a very humble source. A poor girl, the daughter of a blacksmith named Clarges, had served Colonel Monk in the capacity of sempstress. Anne, or, as she was much more commonly called, Nan Clarges, was far from being handsome; it is even said that she was far from being nice or cleanly in her garb and exterior. But Monk was in want, and the girl exerted herself to give him aid. To her, it is said, he frequently owed the food required for his sustenance, when he had no visible means of obtaining it from any other quarter. Monk was noted all his days for being a man of plain tastes. It is the less, therefore, to be wondered at that he gave his affections to this humble minister to his necessities. No marriage took place at this time; but when Monk cast aside his scruples so far as to accept a command from Cromwell against the Irish, and in this and other employments had risen to high distinction among the Commonwealth leaders, Nan Clarges became his wife, notwithstanding the lowliness of her origin, her own degraded condition, and the character of her kindred. The last must have been the most serious difficulty to surmount, one would think, as the mother of Nan Clarges was a woman (according to Aubrey) of by no means fair reputation, and was,

Another fact:—For one week Mr Chipman took his seat by the side of Mr Cole, the police justice of the city of Albany, and with him inquired into each of the fifty criminal cases which came before him, and all but two were distinctly traced to strong drink. The same justice (Mr Cole) gave a written opinion that out of the twenty-five hundred cases that came before him during the previous year, ninety-six in the hundred were from the same cause.

Appeals were then made to physicians, and a very large proportion of that influential profession responded by declaring that ardent spirit was in no case useful, but invariably injurious, as a drink, to men in health.

It was by first collecting such facts as these, and then publishing them by millions, that the public attention was aroused, and in the course of a few years an organisation was formed, of the influence of almost the whole country, to put down this enormous evil.

The first periodical devoted exclusively to temperance was published at Albany in New York, and was called "the Temperance Recorder." Of this paper twenty thousand copies of the first number were gratuitously distributed at the expense of one of our most wealthy and benevolent citizens (the Honourable Stephen Van Rensselaer, of Albany), who, in addition, subsequently contributed large sums to advance the cause. In the course of a few years, the circulation of this paper had increased to two hundred and twenty thousand copies monthly. For two years, a Quarterly Temperance Magazine was also published, for which some of the most able men of our country were writers, it being intended chiefly to influence the educated classes. Another very important effort was the getting up of a Temperance Almanack. Of this useful publication one press alone, in one year, printed seven hundred and fifty thousand copies, which were sold at about two pounds sterling the thousand. A powerful argumentative paper, entitled "the Ox Discourse," aimed particularly at the traffic, was also printed and circulated to the number of two millions and two hundred thousand—a copy for every family in our nation. While this amount of printing was going on in the state of New York under the auspices of the Temperance Society, the Religious Tract Society issued millions of pages on the subject. The Seaman's Friend Society also made great efforts to benefit seamen, and enlighten them as to the effect of strong drink. Other state societies were establishing their own papers and publications, and widely spreading the truth throughout their borders.

Gentlemen of wealth, who did not become members of the society, contributed largely to our funds, hoping in that way to be the means of benefiting their country. On one occasion, when a great object was to be attained, fifteen gentlemen of influence and wealth each gave one thousand dollars. The New York State Society alone has expended nearly one hundred and fifty thousand dollars, and circulated nearly fifteen millions of periodicals, tracts, almanacks, &c.; and I truly believe that every dollar thus expended has saved the nation a thousand.

At a very early period, one of our most prominent objects was to organise the whole country into societies—the American society at the head, then the state, county, town, and school-district societies, the smallest being auxiliary to the next above it, and so on, up to the parent society, in order that once in every year the total results of the general effort might be brought to one point. In the state of New York alone, we had about two thousand societies, numbering from four to five hundred thousand members, and in all the Union, nearly ten thousand societies, and about two millions of members. The opinion at length became very general, that to make, vend, or drink ardent spirit as a beverage, was immoral, and should cease. National and State, county and town, temperance conventions, had declared this to be their opinion; religious bodies had also expressed the same sentiment, and it had become disreputable to use spirit: it was excluded from the sideboard and table, and few but such as disregarded public opinion were found to continue its use. Such an effect was produced on its manufacture, that out of twelve hundred distilleries which had existed in the state of New York at the commencement of the temperance reformation in 1826, less than two hundred now remain, the consumption of ardent spirit throughout the whole Union being reduced by from five-eighths to three-fourths. In consequence of facts collected with great care, and placed before the underwriters of New York, which proved, beyond question, that by far the greater part of all the disasters at sea were occasioned by the use of spirit, they unanimously resolved to take off five per cent. on the premium of insurance of all vessels sailing on the temperance principle, and also voted fifteen hundred dollars to place temperance papers on board ships sailing from the various ports of the United States. This was not done as a temperance movement, but from motives of self-interest, on the same principle as they would have voted money to save any property in jeopardy. Our cause was also much benefited by the government of the United States voting to do away with the spirit rations in the army.

After labouring four or five years, and producing the results I have in part detailed towards putting down the making, vending, and drinking of ardent spirit, the public mind began to demand a more minute investigation as to all the causes of intemperance. Ardent spirit had been exposed, and in a

great degree abandoned, yet drunkenness still remained.

It was intimated by those deeply interested in the cause, from various parts of the country, that although men had nearly ceased to get intoxicated with ardent spirit, very many (even members of temperance societies) were often intoxicated on wine, beer, and cider, and the demand came to the committee of the New York State Temperance Society from all quarters, that the question as to the injurious or beneficial effects of fermented drinks should be fully discussed; and if it should be proved that the same intoxicating principle existed in them as in the distilled, they should be included in the pledge, and treated in the same manner. To meet these views, the gentlemen who had the charge of the temperance press in Albany established "the American Temperance Intelligencer," a newspaper on a large sheet, for free discussion on this branch of the subject. The first men in the country were invited to give their opinion for and against the use of fermented drinks; and such was the interest excited by this discussion, that during the three years this paper was continued, the circulation rose to sixty, and, on more than one occasion, to one hundred thousand per month, it being a monthly publication like "the Recorder." It was only discontinued because parties could no longer be found to advocate in print the doctrine that alcohol in fermented drinks was different from alcohol in distilled liquors, and useful as a beverage. As soon as it was generally known that alcohol was the product of fermentation, the American Society, the New York State Society, and most of the old societies throughout the country, organised themselves anew, and on the principle of total abstinence from all that can intoxicate, as the only means of saving the drunkard or preventing intemperance. Facts of the most convincing character were constantly produced, proving clearly, that unless the societies took this stand, all that had been already done would be eventually lost, and the reformation must be abandoned. When I left America, I did not know of a single society that was exerting any influence on the old ardent spirit pledge exclusively; and although nearly every state has its temperance periodical, there is not one advocating the cause on any other principle than that of total abstinence from all intoxicating liquors. We ascertained, among other facts, that in the state of New York alone, of the five thousand drunkards reformed during one year on the ardent-spirit pledge, about one-half returned again to drunkenness the next year, and in almost every case this fall was occasioned by taking fermented drinks, so that we lost all confidence in the old pledge as to its value for the permanent reformation of drunkards, of whom it was acknowledged (from various computations) that we had from three to five hundred thousand in our Union. We found also, that although distilleries were rapidly diminishing in number, breweries were as rapidly increasing, and also that ardent spirit was consumed in large quantities for the manufacture of an article sold and drunk under the name of wine, although in all probability most of it contained not one drop of the juice of the grape. It seemed evident that the effort to put down the use of ardent spirit was making the fortune of the beer and wine brewers, and that the drunkenness of the country, instead of being dried up, was only flowing in other channels, producing the same flood of misery as when the product of ardent spirit. We traced the influence of cider in the agricultural districts where it was most used, and found that it produced the appetite for stronger drinks. We made the same inquiries respecting wine, and traced the destruction of the youth of the wealthy classes to the practice of daily taking a little at their fathers' tables. I had my own wine analysed by one of our first chemists. The old port contained 48½ per cent. of spirit of the strength of brandy, and the average of the Madeira was 42½ per cent., so that two glasses of either were nearly as intoxicating as one glass of pure brandy. Indeed, the effect of fermented liquors was fully tested in the town of Peterboro', Madison county, New York, where there were thirty-nine drunkards, all of whom were permanently reformed by abstaining from all that could intoxicate, although several went back while only abstaining from ardent spirit.

When the national and state societies first changed their pledge, interest, appetite, and fashion, were all arrayed against us. We defended ourselves with facts which could not be disputed. The ministers of religion, who had generally been with us on the old pledge, deserted us in great numbers when we came to total abstinence: they had objections, I doubt not, satisfactory to themselves. Although we were greatly out of favour, we sent them regularly our publications, and our agents visited them to explain our views and intentions, to endeavour to remove prejudices, and above all to relate facts. These means ultimately brought into our ranks a great proportion of this most influential class. We have in the state of New York twenty-two hundred and fifty ministers of the gospel. Of these, eighteen months since, nineteen hundred and fifty had either pledged themselves to our cause, or were advocating its principles; and probably not far from the same proportion are with us throughout the Union. I really believe that at this time any minister in the United States who should advocate the habitual use of any intoxicating drink, would lose the confidence of his people. Perhaps a few in our largest cities might form an exception.

Another effect of the total abstinence principle is,

that in proportion as it has been adopted, in that proportion the jails and poor-houses have become thinly tenanted, and in some instances entirely vacant, and all branches of industry more flourishing. Great efforts have been made to learn from manufacturers the effect of our system on their establishments, and the prevailing answer is, that the cold-water principle is equal to a protecting duty of twenty per cent. to the manufacturer, while the benefit to the workmen and their families is incalculable. Indeed, in every department of industry, we find, in addition to the great moral and religious benefits, immense pecuniary gain. The apples which the farmer used to convert into cider, to derange the moral and physical faculties of himself, his family, and his workmen, he now makes greatly more profitable as food for his stock. Among some of our later efforts, one of the most beneficial has been through the agency of Mr Chipman, who was so eminently useful in collecting statistics for the old society. He felt that, although the prisons and the almshouses had been visited, the half of the evils brought on the community by the use of intoxicating liquors was not yet developed, and he commenced visiting all the physicians of three counties, and ascertained from them, by a reference to their books, that, during the period of their practice, as regarded their own patients, one-third of the deaths of the adult males were produced by drunkenness; that such persons on the average died twelve years sooner than the temperate; and that nineteen-twentieths were heads of families. To these facts Mr Chipman obtained the certificates of the physicians of whom he made the inquiry.

A further effect of the temperance movement has been to bring the licence law prominently before the public mind. While it is conceded that its object was to check, it is affirmed that its effect is (by professing to legalise) to render respectable the traffic in strong drink; that this traffic, bringing, as it has been fully proved to do, poverty, misery, and crime upon the land, is wrong, and should not be sustained by law; that it cannot be just and right to commission one set of men to degrade and ruin others, or sell them substances which will surely do so. Already six states of the Union have made it a subject of legislation, some annulling the licence law altogether, and others taking steps which will soon bring them to the same results, and I believe that in five years not a state in our Union will license one portion of its citizens to degrade and impoverish another portion, and reduce them to a condition in which the sober and industrious are obliged to support them as criminals or paupers.

THE HOUSE-SPARROW.

At home, abroad, wherever seen or heard,
Still is the sparrow just the self-same bird;
Thievish and clamorous, hardy, bold and base,
Unlike all others of the feathered race.
The bully of his tribe—to all beyond
The gipsy, beggar, knave, and vagabond!

It may be thought that I have here dealt hard measure to the sparrow, but the character I have given of him will be recognised by those who know him, as true. Cowper calls them a thievish race, that, scared as often as you please,

As oft return, a pert, voracious kind;

and that every farmer knows them to be. What multitudes do you see dropping down upon or rising from the wheat as it is ripening in the fields! Formerly a price was set upon their heads and eggs by country parishes. In many places a penny was given for a sparrow's head, and the same for three or four eggs; but this is now done away with, and the farmer must destroy them himself, or pay dearly for it in his corn.

Nothing can exceed the self-complacence of this bird. You see him build his nest amongst the richest tracery of a church roof or window; within the very coronet or escutcheon set up over the gate of hall or palace. We saw, this summer, the hay and litter of his nest hanging out from the richly cut initial letters of William and Mary over one of the principal windows of Hampton Court. Nay, he would build in a span-new V. R. set up only yesterday, or in the queen's very crown itself, though it were worth a kingdom, if it were only conveniently placed for his purpose. He thinks nothing too good for him.

But the most provoking part of his character is, the pleasure which he takes in teasing, molesting, and hectoring over birds of the most quiet and inoffensive nature. He builds about your houses, and thinks no other bird has any business to do the same. The martin, which loves to build under the eaves of our dwellings, after crossing the seas from some far country, has especially to bear his insolence and aggressions. There is a pretty story in the "Evenings at Home," of two of these interesting birds, who had their nest usurped by a sparrow, getting together their fellows, and building him up in the nest, where he was left a prisoner amid his plunder. But the gentleness of the martin is so great, that such an instance of poetical justice is more curious, than likely to occur a second time. But every summer the sparrow lords it over the martin, and frequently drives it away by its impertinence. We watched his behaviour this year with a good deal of attention. Two pairs of martins came and built their nests beneath the eaves of the stable, near each other. Scarcely were the nests half finished, when several sparrows were seen watching on the tiles

close to them, chirping loudly and conceitedly, and every now and then flying at the martins. The nests, however, were completed; but no sooner was this done, than the sparrows took possession of them, and lined them with coarse hay, which is an abomination to the martin, which lines its nest with the softest feathers. Having witnessed this, we waited for about ten days, by which time we supposed the sparrows would have laid their full number of eggs; and a ladder was set up, in order to inflict just retribution on them by taking the whole. But to our surprise there were none! The hay was therefore carefully removed, that the martins, if they pleased, might retake possession; but the very next day, the nests were again filled with hay, and long bents of it hung dangling from the entrance-hole. The sparrows had, with wonderful assiduity, and, as it were, with a feeling of vindictive spite, relined the nests with as much hay as they ordinarily carry to their own nests in several days. Now, it was supposed they would really lay in these nests, but no such thing—they never did. Their only object had been to dislodge the martins, for it was found that these very sparrows had nests of their own in the water-spouts of the house, with young ones in them at the very time, and their purpose of ousting the martins from their own nests being accomplished, the hay remained in the nests quietly all summer.

But this was not all. The poor martins, driven from the stable, came now to the house; and, as if for special protection, began to build their nests under the roof, nearly over the front door. No sooner was this intention discovered by the sparrows, than they were all in arms again. They were seen watching for hours on the tiles just above, chirping, strutting to and fro, flying down upon the martins when they came to their nests with materials, and loudly calling upon their fellow sparrows to help them to be as offensive as possible. The martins, however, rendered now more determined, persisted in their building, and so far succeeded as to prevent the sparrows getting more than a few bents of hay into their nests when complete. The martins laid their eggs; but for several times successively, the sparrows entered in their absence, and hoisted out all the eggs, which of course fell to the ground and were dashed to pieces. Provoked at this mischievous propensity of the sparrows, we had them now shot at, which had the desired effect. One or two of them were killed, and the rest took the hint, and permitted the martins to hatch and rear their young in peace.—*Mrs Houell's Birds and Flowers*, 1838.

OCCASIONAL NOTES.

LIFE-ASSURANCE.

ALTHOUGH the advertisements of life-assurance companies and societies meet the eye in every newspaper, it is surprising how large a portion of the community remains in ignorance of the nature of those institutions. We have heard of individuals conducting extensive business in the same street with several life-assurance societies, who, on the subject being adverted to in their presence, showed that they had all along misunderstood the very leading objects of life-assurance. We lately endeavoured to explain the nature of these societies, with a view to removing, as far as was in our power, this lamentable ignorance; it is a subject, however, which may bear to be touched upon again and again; and we now return to it for the purpose of adding a few facts tending to impress in a lively manner the practical benefits which may arise to those who mutually insure money upon life.

The first class of our facts relates to cases where the life lasted a *short while*; the second, to cases where the life lasted a *long while*. In both it will be seen that the benefit was of a very remarkable nature.

When any one has paid the first premium of insurance for a sum upon his life, that sum, of course, is liable to be realised the very next instant by his decease. Suppose he, being a man of six-and-thirty, were to insure five hundred pounds, the premium for one year would be somewhere about fourteen pounds in most offices. This fourteen pounds being paid, supposing he dies next moment, the office is bound to pay his heirs the five hundred pounds, by which transaction it is clear four hundred and eighty-six pounds have been gained, and that at no one's expense, as the same thing might have happened to any of the co-assurers. There are of course many chances against the termination of his life taking place at that moment; but yet the registers of the insurance offices could show many cases in which death took place surprisingly soon after the commencement of the transaction. An instance of death occurring during the week following the payment of the first premium, did once, we have heard, occur in Edinburgh. In the records of one particular office, we have found a considerable number of cases in which only one premium was paid. We find, for instance, L.500 realised after the policy had run 262 days; L.800, after 330 days; L.600 after 203 days; L.500 after only 74 days; L.1000 after four months; and so forth. About three years ago there occurred one particular case, of a very striking nature. An industrious man engaged in flax-spinning, and who had sunk most of what he had in a concern of that nature, insured L.500 in the month of February, for which the usual comparatively small sum was paid by way of premium; in the ensuing April, not satis-

fied with the first sum, he insured L.500 more; *next month*, after the second policy had run only *twenty-two days*, he died in consequence of a severe injury from his own machinery. Thus his family obtained the welcome sum of a thousand pounds to help them on in the world—a sum which they could not have had, if their parent's death had taken place three months sooner! We do injustice to our case, when we speak of this as profit. It has nothing of the mercantile about it. It is a rescuing, by the most fair means possible, of the widow and fatherless from affliction.

In our former article on this subject, it was shown that most mutual life societies, from demanding a safe amount of premium, acquired in part the character of banks for savings. What is superfluous after paying the demands of a year, is sunk in profitable securities, for the ultimate benefit of the members. The accumulations usually reach a large amount in the course of a few years, if the management have been at all prudent. For instance, L.100, insured in the Equitable Society (of London) in 1816, had become L.152 in 1829, thirteen years after the commencement of the policy. Any one who insured L.1000 in 1806, had he died in 1829, would have left L.2117 to his heirs. Policies effected in 1796, for L.2000, had a bonus or addition of L.4014 put to them in 1829, making L.6014 in all. It is said that the largest addition ever made to a policy in this office was L.496 per cent., nearly a quintupling of the original amount. That policy was effected before May 1776, and it survived 1829. Thus we see that while the insurer has all along the inexpressible comfort of the certainty of leaving his family a certain sum, he is also, in a certain sense, getting rich by the increase which befalls all that part of his annual payments which is not required to make good the claims of those who sink by the way while he goes on in the enjoyment of life.

Having thus put some of the benefits of life-assurance into a still more practical light than before, we conclude our note by once more recommending all who have any income at all, and any dependent relations whom their death might make desolate, to ASSURE UPON THEIR LIVES. It is by far the most safe and convenient means of providing for a family, and decidedly the most unselfish mode of accumulating this world's pelf.

LABOURING CLASSES IN SOUTH AUSTRALIA.

Mr James, in his "Six Months in South Australia," has the following remark:—"It was pleasing to see in Adelaide the importance and respectability of the working classes. In proportion as they were scarce, they were properly estimated, and the responsibility of their situations, particularly shepherds, stock-keepers, and such like, had a tendency very much to lessen the distinction between master and man. Of course, this treatment on the part of the employer made the servant a more important personage in his own eyes, increased his self-respect, made him doubly careful of the property committed to his charge, and altogether seemed to take off the pains of servitude."

So must it ever be. The labouring and serving classes must be in moderate number in proportion to the employment for them, and the portion of national wealth that falls to be distributed amongst them for labour and service, in order that they should stand on a footing approximating to independence with their employers. Thriving young colonies must, as long as they are in that condition, be the very paradise of working men, and the larger their families there, the better.

BIOGRAPHIC SKETCHES.

EARL STANHOPE.

CHARLES STANHOPE, third Earl Stanhope, was born on the 3d August 1753. His grandfather, the founder of this branch of the Stanhope family, was a cadet of the house of Chesterfield, and arrived at high military distinction in what are usually called the Wars of the Succession in Spain. He was afterwards prime minister of Great Britain under George I. His son, the second peer, displayed talents equal to the father's, but in a different form. He addicted himself to the study of the severer sciences, and became one of the most able mathematicians of the day. Son and grandson to these noblemen, the subject of the present memoir fell not beneath them in natural ability, and may be said to have far excelled them in other respects.

At a very early period of boyhood, Charles Stanhope was sent to Eton, but at the age of ten he removed with his father and family to Geneva, where, by the death of his elder brother, he soon afterwards became Viscount Mahon, the title of courtesy given to the eldest sons of the Earls Stanhope. In Geneva the family of Lord Stanhope passed a considerable number of succeeding years, and in this city, accordingly, the young Viscount Mahon received the principal part of his education. His tutor was M. Le Sage, a well-known man of letters in the place. There can be little doubt that the whole political career of the future Earl Stanhope was deeply influenced by the circumstance of his receiving his education in this republican city, and that here were acquired his extreme notions regarding civil liberty, and other points affecting the welfare of great communities. Dr Moore, the well-known traveller and novelist, relates that he once incidentally asked Viscount Mahon, when walking with him in the streets of Geneva, to enter an assembly of persons who were adverse to certain popular opinions held in the republic. "No," said the young nobleman with in-

dignation, "I will not go for a moment into such a society; I consider these men as the enemies of their country." At the same time, while imbibing those sentiments that made him afterwards so noted in his character of a politician, he was actively pursuing a course of training in Geneva, which in time made him equally distinguished as a man of science and letters. Natural philosophy, in all its branches, was his favourite study, and the extent of his knowledge of the subject, almost within the years of boyhood, was decisively shown by his obtaining a prize offered by the Stockholm Society of Arts and Sciences, for the best Essay on the Pendulum. When he won this high distinction, he had but attained the age of eighteen. The essay was written in French, and was published by the donors (we believe) of the prize. This success of so young an individual, and that individual the heir of a wealthy and noble family, must appear remarkable enough, especially when it is considered that many eminent continental men of science would probably be his competitors; yet it may be regarded as a circumstance still more remarkable, that Viscount Mahon's essay was not the fruit of mere reading, like most juvenile compositions on science, but was actually based on numerous original experiments, performed by his lordship in person.

Lord Stanhope (as it will be better to style the subject of our memoir throughout the sequel, though he remained Viscount Mahon till the death of his father in 1786) appears to have passed his majority by a year or two, ere he returned permanently to England in the company of his family. It is told that the whole population of Geneva were affected at the departure of the noble English residents, and that their travelling carriages could scarcely move through the streets, on account of the crowds of poor people assembled to take a last look of those who had been long their generous benefactors. On reaching Britain, the family rank and influence of our young nobleman speedily procured him an entrance into the House of Commons, where he sat until his succession to the Stanhope title called him to the Upper House of Parliament. It was among the peers chiefly that he became famous as a politician. To this point, further allusion will yet be made in this article; but it may be observed here, that *honesty* was his grand feature as a statesman, as is in part evinced by the very fact that, although his lordship married Lady Esther Pitt, eldest daughter of the great Earl of Chatham, he opposed through life the leading measures of his brother-in-law, the second William Pitt, despising all the chances of personal benefit which the latter's long premiership might be supposed to place at the command of any talented and flexible kinsman.

It is in the light of a man of science, and of an inventor in the field of practical mechanics, that we propose first to consider Lord Stanhope. About the year 1775, when he was just leaving the Continent, his lordship addressed himself to the task of discovering some "means of preventing fraudulent practices on the gold coin." The result was the publication of a pamphlet, bearing a title worded nearly as above, and in which he recommended the adoption of various processes calculated to protect all mints from felonious imitations of their issue. The particulars of this plan are of too technical a kind, however, to obtain notice here. Suffice it to say, that, like many of the noble inventor's suggestions, his coinage schemes have probably been long put in practice by those who may never have heard of the inventor's name. His lordship paid some attention, also, to the subject of bank-note forgeries, and we believe that a better preventive of this crime, simple as the device seems, will never be discovered than that which he pointed out. This was merely "the employment of first-rate engravers" by the banks that issued notes. Any complication of figures, such as most notes rely on for security, may be imitated by an inferior artist, if he has but patience and perseverance; while, on the other hand, an exquisite, though much more simple specimen of a great engraver's powers, may defy all the half-educated copyist's labours, were he to work at it for a lifetime.

This tendency to revert to plain and simple first principles for the discovery of new scientific agents and expedients, characterised all Lord Stanhope's investigations in natural philosophy. His very interesting and important experiments on the subject of fire, and on the mode of rescuing houses from the dangers of this element, are founded on the simple principle, that without a current of air there can be no combustion—at least of the ordinary kind. His lordship was in the habit of familiarly illustrating this truth by folding a slip of paper tightly around one of his fire-irons, and then applying to it the flame of a candle, when it was seen that no ignition could be produced. But on the instant that the paper was relaxed, and air allowed to intrude itself between the iron and the paper, the combustion followed immediately. Carrying this principle into practical operation, Lord Stanhope invented a species of stucco or plaster for coating wood, which composition, by excluding the air, had the power of rendering fire perfectly harmless. In the Philosophical Transactions for 1778, his lordship gives a full account of the experiments performed by him in presence of the Lord Mayor and Aldermen of London, the members of the Royal Society, and other distinguished persons, whom he convinced thoroughly of the practicability of his plan, as well as of its complete efficacy. The possession of an ample fortune enabled his lordship, luckily, to try all his projects on the most perfect model scale.

besides, "one of five women barbers," so notorious all of them in the city, that a ballad was made upon them, the burden of which ran thus:—

Did you ever hear the like,
Or ever hear the same,
Of five women barbers,
That lived in Drury-Lane?

Nevertheless, as the lady of General Monk, Nan filled no mean place in the eye of the world during the times of the Cromwells; and when these were past, the share which her husband had in placing Charles II. on his throne, made her a British peeress of the first rank, namely, Duchess of Albemarle. Her understanding, it is said, was not unworthy of such a station, and this, probably, was the quality which Monk valued in her. In Granger's Biographical History of England, we are informed that the general "often consulted her in the greatest emergencies." How odd to think that the continuation of monarchy in Britain materially depended on a sempstress girl, the daughter of a poor blacksmith, and a woman-barber of low fame! Yet such seems to have been the case. Monk could have turned the balance as he chose, previously to the Restoration, and his wife, the most influential of his counsellors, was a thorough royalist. "It is probable (says Granger) that she had no inconsiderable share in the Restoration. She is supposed to have recommended several of the privy-councillors in the list which the general presented to the king on landing." The Duchess of Albemarle did a worse act than aiding to restore the king, when she persuaded Monk to abet the fall of one of the best statesmen England ever possessed. "She was an implacable enemy to Lord Clarendon, and had so great an influence over her husband, as to prevail with him to help to ruin that excellent man, though he was one of his best friends."

On account of the latter circumstances, we must perhaps take with some reservation the many charges brought against the duchess in the Continuation of Clarendon's Life. Certain it is, however, that her husband's influence enabled her to carry on a lucrative trade in selling offices, which always went to the highest bidder. Another fault of hers is more certain—that she retained the low manners of her early life to her dying hour. Her temper was one that soon "took fire, and her anger knew no bounds. She was a great mistress of all the low eloquence of abusive rage, and seldom failed to discharge a volley of vulgar expletives against such as thoroughly provoked her. Nothing is more certain than that the intrepid commander, who was never afraid of bullets, was often terrified by the fury of his wife."

Samuel Pepys, secretary to the admiralty in Charles II.'s time, tells us, in his candid and curious diary, that the Duchess of Albemarle was a "plain, homely dowdy," and a "very ill-looking woman." He also gives various anecdotes of her want of breeding and her shrewish temper. She uttered a most affronting saying respecting Lord Sandwich on an occasion when Pepys and other chief intimates of Lord S. were present. "At table the duchesse, complaining of her lord's going to sea next year, uttered these biting words:—'If my lord had been a coward, he had gone to sea no more: it may be then he might have been excused and made an ambassador' (meaning Lord Sandwich). This made me mad, and I believed she perceived my countenance change, and blushed herself very much." Pepys also tells us of her selling of offices. For example, "My Lady Monk hath disposed of all the places which Mr Edward Montague hoped to have had, which I am afraid will undo him, as he depended much upon the profit of what he should make by these places?"—which shows us that, after all, as far as offices were concerned, the duchess only did as those around her did at the period.

THE IRISH POOR IN GREAT BRITAIN.

THE Irish poor who emigrate into England and Scotland are of two classes; those who come for a short period and for a particular purpose, such as reaping during the time of harvest—and those who break off all connection with their country, and settle permanently in Great Britain. It is to the latter class that the following observations refer.

The first most powerful impulse to Irish emigration into this country was occasioned by the Irish rebellion of 1798. Many who had been implicated in the events of that unhappy period were driven to seek an asylum in parts of England and Scotland, where they would be unknown, and might, as it were, begin life anew. It happened, likewise, that the Irish rebellion was coincident, in point of time, with the first introduction of the spinning of cotton by power into the West of Scotland; and there existed, at that period, among the native working classes of both sexes in that district, a strong objection to factory labour, so that the master-spinners of Paisley and Glasgow were glad to employ the Irish as being the only persons who would work for them; by which means the Irish obtained a footing in the cotton-mills of those two great manufacturing towns, which they have in a great measure retained up to the present day. In England there was not the same pre-

judice among the natives against factory labour; consequently, in the great English cotton manufactories, there are, on the whole, few Irish, especially in the higher branches of the trade.

The great bulk of the Irish population, both in England and Scotland, is formed of the common day-labourers. Without excelling in any branch of industry, they may be said to have obtained the almost exclusive possession of all the lowest departments of manual labour in this country. There appears to be in Ireland a general disposition to emigrate in search of more profitable employment; and many of the Irish leave their country with very vague and ill-defined projects, and with highly exaggerated notions of the chances of success in England. This disposition to emigrate seems to have been further encouraged by the cheap and regular communication which has taken place between the two countries, within the last fifteen years, by means of steam navigation.

When the lateness of the period at which the Irish began to emigrate is considered, the number of Irish in England and Scotland is perhaps greater than might have been expected. In the year 1834, their number was estimated in Lancashire at 50,000, in Edinburgh at 10,000, in Dundee at 5000, in Aberdeen between 2500 and 3000. A large part of the population of Ayrshire is also stated to be Irish, particularly in its southern parts. Of the population of Wigtownshire, which in 1831 amounted to 36,258, two-thirds are supposed to be Irish, or of Irish extraction; as is likewise a large part of the population of Kirkcudbrightshire. In Lancashire the number of Irish is calculated not to exceed 100,000. In 1833, there were 35,000 Irish in Manchester, of whom 30,000 were Catholic, and 5000 Protestant. In Birmingham there are about 6000 Irish; and they are diffused over the other parts of England and Scotland, in various degrees of proportion to the population at large.

The great bulk of the Irish poor in Great Britain are chiefly employed in the towns, at various kinds of coarse unskilled labour, and especially in the several branches of the building trade, as masons', bricklayers', and plasterers' labourers, brickmakers, quarrymen, &c. At Liverpool and Glasgow, a very large portion of the porters engaged in loading and unloading vessels at the quays are likewise Irish.* In no part of England have the Irish settled in the country as agricultural labourers. In the south-west of Scotland, however, a large part of the native population has been displaced by Irish settlers, and nearly all the lower descriptions of farm labour in Wigtownshire, Kirkcudbrightshire, and the southern extremity of Ayrshire, are now performed by Irish. A great portion of the Irish poor in this country subsist by mendicancy. Whilst some few of this class have come over with the deliberate intention of gaining a livelihood by begging, the greater part of the mendicants have doubtless become such from their inability to obtain employment; and have afterwards continued from preference the mode of life to which they were originally driven by necessity.

The dwellings of the Irish in Great Britain are of the cheapest kind that can be procured; and thus they are collected in the lowest, dampest, dirtiest, and most unhealthy parts of the towns. In Liverpool and Manchester very many of them inhabit cellars, which are always dark and confined, and frequently wet. They have likewise a practice of living, to a great extent, in lodging-houses, in which single beds are let by the week or the night, and large numbers are crowded together in the same room. The state of these houses is usually wretched in the extreme; and from the filthy condition of the bedding, the want of the commonest articles of furniture, the uncleanly habits of the inmates themselves, and the numbers which, without distinction of age or sex, are closely crowded together, they are frequently the means of generating and communicating infectious diseases.

It does not appear that the Irish labourers who settle in Great Britain, increase, to any considerable extent, their comforts, or improve their style of living, in proportion to the increase of their incomes. They seem to have a fixed standard of existence, little, if indeed at all, superior to that which they have observed in their own country; and, generally speaking, every thing beyond the sum which enables them to live in this manner is spent in drinking. It might have been imagined that an increase of wages would naturally have led to an increase of comforts. This, however, upon inquiry, has not been found to be the fact. The additional earnings are not spent in obtaining comforts, or even necessities, but luxuries, and those too of the kind for immediate consumption. But although a large part of the Irish settlers retain their former habits of life unaltered, and others are deteriorated, in some degree, by their change of abode and the new relations in which they are placed, yet there are many on whom a beneficial influence is exercised, and whose character and habits are improved by the change. As in Edinburgh, so in other large towns, there is a class of persons ori-

* In fact, the Irish are in many places of great use in working at operations for which native Scotch cannot well be procured. They seem to possess an enterprise and heartiness in working, of which the lower orders of our own people are deficient. In Edinburgh, many of them have within the last few years taken up the trade of selling fish in small carts, and have thus, as far as the environs of the city and country around are concerned, possessed the ground formerly in the hands of the native fish-women. The higher class of Irish who have engaged in trade in Edinburgh, are among the most industrious and well behaved of the community.

ginally from "dear ould Ireland," who are highly respectable, and, indeed, no way inferior to the Scotch or English. If, in general, the example of the native working classes is not found to exercise as powerful an influence on the Irish settlers, in point of domestic improvement, as might have been anticipated, it arises chiefly from the separation and want of intercourse between the two classes. In dress and personal appearance, however, the Irish usually make a considerable improvement; the example of the natives being the motive, and the increased earnings affording the means.

Upon the whole, the Irish poor who settle in Great Britain cannot be said to be a thriving people, and, for the most part, their condition is only one degree better than it was in their own country.

THE LYING SERVANT.

THERE lived in Swabia a certain lord, pious, just, and wise, to whose lot it fell to have a serving-man, a great rogue, and, above all, addicted to the vice of lying. The name of the lord is not in the story, therefore the reader need not trouble himself about it.

The knave was given to boast of his wondrous travels. He had visited countries which are nowhere to be found in the map, and seen things which mortal eye never beheld. He would lie through the twenty-four hours of the clock—for he dreamed falsehoods in his sleep, to the truth of which he swore when he was awake. His lord was a cunning as well as a virtuous man, and used to see the lies in the valet's mouth, so that he was often caught—hung as it were in his own untruths, as in a trap. Nevertheless he persisted still the more in his lies, and when any one said, "How can that be?" he would answer, with fierce oaths and protestations, that so it was. He swore, *stone and bone*, and might the —, and so forth! Yet was the knave useful in the household, quick and handy; therefore he was not disliked of his lord, though verily a great liar.

It chanced, one pleasant day in spring, after the rains had fallen heavily, and swollen much the floods, that the lord and the knave rode out together, and their way passed through a shady and silent forest. Suddenly appeared an old and well-grown fox. "Look!" exclaimed the master of the knave; "look, what a huge beast! never before have I seen a reynard so large!" "Doth this beast surprise thee by its hugeness?" replied straight the serving-groom, casting his eye slightly on the animal, as he fled for fear away into the cover of the brakes; "by *stone and bone*, I have been in a kingdom where the foxes are big as are the *bulls* in this!" Whereupon, hearing so vast a lie, the lord answered calmly, but with mockery in his heart, "In that kingdom there must be excellent lining for the cloaks, if furriers can there be found well to dress skins so large!"

And so they rode on—the lord in silence: but soon he began to sigh heavily. Still he seemed to wax more and more sad in spirit, and his sighs grew deeper and more quick. Then inquired the knave of the lord what sudden affliction, or cause of sorrow, had happened. "Alas!" replied the wily master, "I trust in heaven's goodness that neither of us two hath to-day, by any forwardness of fortune, chanced to say the thing which is not; for, assuredly, he that hath so done must this day perish." The knave, on hearing these doleful words, and perceiving real sorrow to be depicted on the paleness of his master's countenance, instantly felt as if his ears grew more wide, that not a word or syllable of so strange a discovery might escape his troubled sense. And so, with eager exclamations, he demanded of the lord to ease his suspense, and to explain why so cruel a doom was now about to fall upon companionable liars.

"Hear, then, dear knave," answered the lord, to the earnestness of his servant, "since thou must needs know, hearken! and may no trouble come to thee from what I shall say. To-day we ride far, and in our course is a vast and heavy rolling flood, of which the ford is narrow, and the pool is deep; to it hath heaven given the power of sweeping down into its dark holes all dealers in falsehood, who may rashly venture to put themselves within its truth-loving current! But to him who hath told no lie, there is no fear of this river. Spur we our horses, knave, for to-day our journey must be long."

Then the knave thought, long, indeed, must the journey be for some who are now here: and as he spurred, he sighed heavier and deeper than his master had done before him, who now went gaily on; nor ceased he to cry, "Spur we our horses, knave, for to-day our journey must be long."

Then came they to a brook. Its waters were small, and its channel such as a boy might leap across. Yet, nevertheless, the knave began to tremble, and falteringly asked, "Is this now the river where harmless liars must perish?" "This, ah no!" replied the lord: "this is but a brook; no liar need tremble here." Yet was the knave not wholly assured, and, stammering, he said, "My gracious lord, thy servant now bethinks him, that he to-day hath made a fox too huge: that of which he spake was verily not so large as is an ox, but, *stone and bone*, as big as is a good-sized *roe*!"

The lord replied, with wonder in his tone, "What of this fox concerneth me? If large or small, I care not. Spur we our horses, knave, for to-day our journey must be long."

Long, indeed, still thought the serving-groom, and in sadness he crossed the brook. Then came they to a stream, running quickly through a green meadow, the stones showing themselves in many places above its frothy water. The varlet started, and cried aloud, "Another river! surely of rivers there is to-day no end: was it of this thou talkedst heretofore?" "No," replied the lord, "not of this." And more he said not: yet marked he with inward gladness his servant's fear. "Because, in good truth," rejoined the knave, "it is on my conscience to give thee note, that the fox of which I spake was not bigger than a *cat*!" "Large or small, let me

EDINBURGH JOURNAL

not be troubled with thy fox: the beast concerneth me not at all."

As they quitted the wood, they perceived a river in the way, which gave sign of having been swollen by the rains, and on it was a boat. "This, then, is the doom of liars," said the knave, and he looked earnestly towards the passage-craft. "Be informed, my good lord, that Reynard was not larger than a fat wether sheep!" The lord seemed angry, and answered, "This is not yet the grave of falsehood: why torment me with this fox? Rather spur our horses, for we have far to go." "Stone and bone," said the knave to himself, "the end of my journey approacheth!"

Now the day declined, and the shadows of the travellers lengthened on the ground; but darker than the twilight was the sadness on the face of the knave. And as the wind rustled the trees, he ever and anon turned pale, and inquired of his master if the noise were of a torrent or stream of water. Still, as the evening fell, his eyes strove to discover the course of a winding river. But nothing of the sort could he discern; so that his spirits began to revive, and he was fain to join in discourse with the lord. But the lord held his peace, and looked as one who expects an evil thing.

Suddenly the way became steep, and they descended into a low and woody valley, in which was a broad and black river, creeping fearfully along, like the dark stream of Lethe, without bridge or bark to be seen near. "Alas! alas!" cried the knave, and the anguish oozed from the pores of his pale face. "Ah! miserable me! this then is the river in which liars must perish!" "Even so," said the lord; "this is the stream of which I spake: but the ford is sound and good for true men. Spur our horses, knave, for night approacheth, and we have yet far to go."

"My life is dear to me," said the trembling serving-man; "and thou knowest that were it lost, my wife would be disconsolate. In sincerity, then, I declare that the fox which I saw in the distant country was not larger than he who fled from us in the wood this morning!"

Then laughed the lord aloud, and said, "Ho, knave! wert thou afraid of thy life? and will nothing cure thy lying? Is not falsehood, which kills the soul, worse than death, which has mastery only over the body? This river is no more than any other, nor hath it a power such as I feigned. The ford is safe, and the waters gentle as those we have already passed: but who shall pass thee over the shame of this day? In it thou must needs sink, unless penitence come to help thee over, and cause thee to look back on the gulf of thy lies, as on a danger from which thou hast been delivered by heaven's grace." And as he railed against his servant, the lord rode on into the water, and both in safety reached the opposite shore. Then vowed the knave, by stone and bone, that from that time forward he would duly measure his words, and glad was he so to escape. Such is the story of the lying servant and the merry lord, by which let the reader profit. —*London Magazine.*

EGGS AND POULTRY.

AMONG all nations, and throughout all grades of society, eggs have been a favourite food. But in all our cities, and particularly in winter, they are sold at such prices that few families can afford to use them at all, and even those who are in easy circumstances consider them too expensive for common use. There is no need of this. Every family, or nearly every family, can with very little trouble have eggs in plenty during the whole year; and of all the animals domesticated for the use of man, the common dunghill fowl is capable of yielding the greatest possible profit to the owner. In the month of November I put apart eleven hens and a cock, gave them a small chamber, in a wood house, defended from storms, with an opening to the south. Their food, water, and lime, were placed on shelves convenient for them, with nests and chalk nest-eggs in plenty. These hens continued to lay eggs throughout the winter. From these eleven hens I received an average of six eggs daily, during winter, and whenever any one of them was disposed to sit, namely, as soon as she began to cluck, she was separated from the others by a grated partition, and her apartment darkened. These cluckers were well attended and well fed: they could see and partly associate through the grates with the other fowls, and as soon as any one of these prisoners began to sing, she was liberated, and would very soon lay eggs. It is a pleasant thing to feed and tend a bevy of laying hens: they may be tamed so as to follow the children, and will lay in a box.

Egg-shells contain lime, and when in winter the earth is bound with frost, or covered with snow, if lime is not provided for them, they will not lay, or if they do, the eggs of necessity must be without shells. Old rubbish lime, from chimneys and old buildings, is proper for them, and only needs to be broken. They will often attempt to swallow pieces of lime and plaster as large as walnuts. The singing hen will certainly lay eggs, if she find all things agreeable to her; but the hen is so much a prude, as watchful as a weasel, and as fastidious as a hypocrite; she must, she will have secrecy and mystery about her nest: all eyes but her own must be averted: follow or watch her, and she will forsake her nest and stop laying. She is best pleased with a box covered at the top, with a back aperture for light, and a side door by which she can escape unseen. A farmer may keep one hundred fowls in the barn, may suffer them to trample upon and destroy his mows of corn, and other grains, and still have fewer eggs than the cottager who keeps a single dozen, who provides secret nests, chalk eggs, pounded bricks, plenty of corn, water, and gravel for them, and who takes care that his hens are not disturbed about their nests.

Three chalk eggs in a nest are better than one, and large eggs please them most: I have often smiled to see them fuddle round and lay into a nest of geese eggs. Pullets will begin to lay early in life when nests and eggs are plenty, and when others are clucking around them. A dozen dunghill fowls, shut up away from other means of obtaining food, will require something more than a quart of corn a-day. I think fifteen bushels a-year a fair allowance for them, but, more or less, let them always

have enough by them, and after they have become habituated to find enough at all times, they take but few kernels at a time, except just before retiring to roost, when they will take nearly a spoonful in their crops; but, just so sure as their provisions come to them scanted or irregularly, so surely will they raven up a whole cropful at a time, and will stop laying. A single dozen fowls, well attended, will furnish a family with more than two thousand eggs a-year, and one hundred full-grown chickens for the fall and winter stores. The expense of feeding a dozen fowls will not amount to more than eighteen bushels of corn. They may be kept in cities as well as in the country; will do as well shut up the year round as to run at large; and a grated room, well lighted, ten feet by five, partitioned from a stable or other outhouse, is sufficient for the dozen fowls, with their roosting-places, nests, and feeding-troughs. In the spring of the year five or six hens will hatch at a time, and the fifty or sixty chickens may be given to one hen. Two hens will take care of one hundred chickens well enough until they begin to climb their little stick roosts: they should then be separated from the hens entirely. I have often kept the chickens, when young, in my garden: they keep the May-bugs and other insects from the vines, &c. &c. In case of confining fowls in summer, it should be remembered that a ground-floor should be chosen, or it would be just as well to set in their pen boxes of well-dried pulverised earth for them to wallow in in warm weather. Their pens should be kept clean. —*Scotch Reformers' Gazette.*

[We give the above as containing perhaps some useful information, but do not ourselves attach much credit to the statements which are made. We have tried to keep fowls in a moderately confined situation, but, like many others, have failed to make them pay for their food. Unless hens have a good run of ground, and can pick up a large share of their food without expense to their proprietor, it is almost useless, and in some degree cruel, to keep them. The plan proposed, however, can be tried by those who have spare time and accommodation, and to whom the risk of failure is no object.]

POWER AND GENTLENESS,

OR THE CATARACT AND THE STREAMLET.

Noble the Mountain Stream,
Bursting in grandeur from its vantage-ground;
Glory is in its gleam
Of brightness;—thunder in its deafening sound!
Mark, how its foamy spray,
Tinged by the sunbeams with reflected dyes,
Mimics the bow of day
Arching in majesty the vaulted skies;—
Thence, in a summer-shower,
Steeping the rocks around:—O! tell me where
Could majesty and power
Be clothed in forms more beautifully fair?

Yet lovelier, in my view,
The Streamlet, flowing silently serene;
Traced by the brighter hue,
And livelier growth it gives:—Itself unseen!
It flows through flowery meads,
Gladdening the herds which on its margin browse;
Its quiet beauty feeds
The alders that o'ershade it with their boughs.
Gently it murmurs by:
The village churchyard:—its low, plaintive tone
A dirge-like melody
For worth and beauty modest as its own.

More gaily now it sweeps
By the small school-house, in the sunshine bright;
And o'er the pebbles leaps,
Like happy hearts by holiday made light.

May not its course express,
In characters which they who run may read,
The charms of gentleness,
Were but its still small voice allowed to plead?

What are the trophies gained
By power, alone, with all its noise and strife,
To that meek wreath, unstained,
Won by the charities that gladden life?
Niagara's streams might fail,
And human happiness be undisturbed:
But Egypt would turn pale,
Were her still Nile's overflowing bounty curbed!

—*Poems of Bernard Barton.*

A LONDON DAIRY.

Laycock's dairy, at Islington, covers a space of sixteen acres, including the layers, grain-pits, rick-yards, &c. &c. It contains nine cow-houses, each about one hundred and forty feet in length, by twenty-four feet broad; each of these contains sixty-four cows, thirty-two on a side. There are also fattening pens, and an infirmary for such of them as may happen to require temporary separation; these instances, however, considering the great number kept, and the artificial mode of treatment, are but rare. The animals, all of the finest description, are constantly kept in the houses both day and night; in the summer season only, being turned out for a few hours daily into the layers. Cows are rarely kept here longer than twelve months, during which period they are regularly milked; and, what may appear extraordinary to those ignorant of the management, the process of fattening goes on with the milking; so that, by the time they become what is termed "dry," most of them are fit for Smithfield, and but few of the number (six hundred constantly kept) require "stalling" after the period of milking is at an end. This number affords twelve hundred gallons of milk per diem, upon the average; it is taken away at an early hour in the morning and afternoon by the vendors, who purchase here to retail in the metropolis. The average worth of each cow is about £13, which, assuming the number kept always to average six hundred (the

minimum rather than otherwise), gives a capital of £10,800, always afloat to stock this stupendous dairy with cows only. Their food consists of grains, mangel wurzel, the Swedish turnip (the latter for fattening), and hay, at the rate of one bushel of grains, 56 pounds of mangel wurzel or turnip, and 12 pounds of hay, to each; or 600 bushels of grains, 15 tons of wurzel and turnip, and 63.28 tons of hay, per day, to the total number. The quantity of butter made here is, for an obvious reason, small, and rarely exceeds 100 pounds per week. The number of pigs kept here is about 400; some bred, others bought in, and all fattened here. Forty horses are always required, and constantly employed upon the dairy. Such is one of the London lactaries; there are many of them, some of larger, several of equal, and a few of inferior extent. —*Bucks Gazette.*

EFFECT OF MARSHES IN PRODUCING FEVER.

There can be no doubt that fever is always prevalent in the neighbourhood of marshes. Warden, in his account of the United States of America, remarks, "All low parts of the United States, along the banks of rivers and lakes, and near the borders of stagnant waters, and in marshy situations, where vegetable or animal substances, in a state of decay, are exposed to the action of the autumnal sun, are subject to an intermittent or bilious fever. In every low situation, where the rich vegetable soil is first exposed to the action of the sun, or where the water disappearing presents to its action a muddy surface, deleterious emanations are produced, which, ascending to the surface of a neighbouring hill, become the cause of disease there, as well as near the surface where they originated." He gives a great number of instances of fevers having broken out in America in the neighbourhood of marshes; and he also cites, from various authors, cases showing the pestilential effect of marshes in Europe on the health. The Pontine marshes in Italy are well known to have produced for centuries numerous febrile diseases. Lancisi, physician to Pope Clement XI., relates, that in the vicinity of Rome, thirty persons of both sexes, and of the highest rank, being on a party of pleasure near the mouth of the Tiber, the wind suddenly changed, and blew from the south across putrid marshes; and that such was its effect, that all except one were suddenly seized with tertian fever. An inundation of the rivers in Hungary, which covered many parts of the country with stagnant waters, is said to have occasioned the loss of 40,000 of the Austrian army. The annual overflowing of the Nile has produced the same effect, from the earliest times, at Alexandria and other places. In August 1765, a continued or remitting fever was produced among the soldiers and marines stationed in the island of Portsea, in the neighbourhood of stagnant waters, and a great number of them were carried off. Warden remarks, that "the most extraordinary fact regarding marsh miasms is, that their influence is more sensibly felt on the summit of the neighbouring hills than on the very borders of the marsh whence they emanate. An invisible and pestiferous vapour, which rises by its lightness, or is wafted by currents of air, hovers on the summit during the hot season, and soon paralyses the strongest constitutions." He gives several instances where such pestilential exhalations had produced fevers at the distance of two miles. The short duration of human life in marshy districts has been remarked by all writers on population. For example, the average duration of life is at least one-third lower in Holland than in England or France. In Switzerland, according to the observations of Muret, the probability of life, or the age to which half the born live, was as follows:—In nine parishes of the Alps, 47 years; in 41 parishes of the Pays de Vaud and Jura, 42; in 12 parishes where grain was cultivated, 40; in 18 parishes among the great vineyards, 37; in one marshy parish, 24! —*Tait's Edinburgh Magazine*, July 1839.

THE RULES OF THE KING'S BENCH.

The rules are a certain liberty adjoining the prison, and comprising some dozen streets, in which debtors who can raise money to pay large fees, from which their creditors do not derive any benefit, are permitted to reside by the wise provisions of the same enlightened laws which leave the debtor who can raise no money to starve in jail, without the food, clothing, lodging, or warmth, which are provided for felons convicted of the most atrocious crimes that can disgrace humanity. There are many pleasant fictions of the law in constant operation, but there is not one so pleasant or practically humorous as that which supposes every man to be of equal value in its impartial eye, and the benefits of all laws to be equally attainable by all men, without the smallest reference to the furniture of their pockets. —*Nicholas Nickleby.*

THE MEMORY OF THE DEAD.

It is an exquisite and beautiful thing in nature, that when the heart is touched and softened by some tranquil happiness of affectionate feeling, the memory of the dead comes over it most powerfully and irresistibly. It would almost seem as though our better thoughts and sympathies were charms, in virtue of which the soul is enabled to hold some vague and mysterious intercourse with the spirits of those we dearly loved in life. Alas! how often and how long may those patient angels hover above us, watching for the spell which is so seldom muttered, and so soon forgotten! —*The same.*

OPINION OF LONDON.

A worthy countryman from the neighbourhood of And Reekie having been on a visit to London for the first time, was addressed by a friend on his return:—"Well, John, what think ye o' London now—is't yon a gran' place?" "A gran' place!" echoed the disappointed tourist; "Oh, man, Sandy, it's just like a thousand Coogates!"

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any old numbers to complete sets. Persons requiring their volumes bound along with title pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

THE FOLLOWER OF THE FAMILY.

PART THE SECOND.

I LEFT little Evelyn, surnamed "the blessed," living amongst the simple people of Tullygarrett. She was then a few weeks old ; I find her now a beautiful bright-haired child, singularly interesting and intelligent. As she grew older, her nurse imagined she perceived a thin film spreading over her eyes. Her feelings upon this painful subject resolved into one idea : if she should ever find "Masther Garrett," Evelyn perhaps would not be able to see her own "father." The simple-minded affectionate woman imagined the summit of human misery. She would bring up his child, and yet, if she should ever meet him, the pleasure of looking on him would be denied to her. She had often pictured the joy of such a meeting ; but an Irishwoman's joy is always eloquent, and Margaret failed to fancy how Evelyn could express herself if she were denied the power of beholding her parent. She would move various colours before the child's eyes, and finding that the eyes remained motionless, she would turn away in the bitterness of her sorrow, and exclaim, "He left her sightless, and he will find her so !" She would then add, "But it's the will of God ! it's the will of God ! and sure His will is both justice and mercy." This trusting in the justice and in the mercy of Divine Providence, is a never-ceasing comfort to the poor Irish ; no matter what their troubles are, this reliance never deserts them ; and though Margaret used every probable and improbable means to restore sight to her darling, yet each disappointment was followed by the resigned expression of "God's will be done," even while tears of bitter sorrow and disappointment were coursing each other down her cheeks. It was pleasant to observe the delicacy and attention with which the poor treated this little object of their solicitude. Every peasant felt an interest in Evelyn, and this feeling of interest was mingled with one of respect. "Sure she's of a good ould stock on one side, any way, and it wouldn't be right for the like of us to forget that. It's all in the hands of God ! Who knows what will turn up for her yet, the craythur !" The little maid was always better dressed than Margaret's young relations, and no jealousy or discomfort was excited by the distinction ; the most "mealy" potatoes were chosen by their own hands for her, and "the drop of sweet milk" placed in her little china mug on the top shelf of the dresser, while the young Sheils' noggin of sour milk waited their dinner, where it sometimes became the prey of the kitten or the "bonneen."* The rich may think these small attentions and sacrifices nothing, but those who have never wanted are bad judges of what it is to bestow, not from multitude, but from misery. Margaret had found in Mrs O'Dwyer's trunks many of those shreds and patches, and even pieces of damask and chintz, lutestring and mode—"relics of ould decency," as she called them—which she had already begun to convert into "coats" for Evelyn, and mounted a long feather or two in the wide-leaved straw hat plaited by her own industrious fingers, to protect her favourite's delicate complexion from the sun. There was a wild common stretching at the back of the cottages, forming what was ostentatiously called the *town* of Tullygarrett ; and day after day, little Evelyn, carefully watched by Mary or Essy Shiel, would wander through the heath, or nestle amid the fern to sleep when fatigued. A little incident will show that though Evelyn was with the cottage children, she had imbibed some how or other a feeling of pride beyond them. The Cork mail crossed this heath once a-day, and the children of the village

used to watch its passing, and beg most vociferously of the passengers. It was wonderful how fast the little urchins used to run, and how loud they used to scream ; run ! ay, a mile and a half for a halfpenny, their two little dirty feet going as fast as the coach-horses' four. One day, however, an accident happened the coach ; the guard had substituted a kippeen* for a linch-pin, and, as might have been expected, the wheel rolled quietly off, and deposited the outside passengers in the soft earth of a bog. This was very unpleasant, but it might have been worse. Irishmen bluster and swear at an accident, but soon get over it ; and after a little blustering, and a good deal of swearing, the passengers walked on, while the guard manufactured a linch-pin out of the handle of the door.

Little Evelyn had heard the bustle from a hillock at a distance, and was always much amused by the passing of the coach. She continued plaiting a rush basket, and when, attracted by her exceeding beauty, one of them addressed her, she shook

"The golden treasures of her hair."

and answered in her own sweet childish voice, still continuing her occupation. Little Essy Shiel came up, and in reply to a question addressed to Evelyn, dropt her curtsy, and observed, "Sir, if you please, she has no *light* at all at all." Upon this Evelyn blushed, and tears fell from her sightless eyes.

"What ! blind ?" he inquired ; "sight is in her eyes for all that."

"Ay," said Essy, "but no good ; only aunt says maybe it went be always so."

"Is she your cousin ?"

"Oh no, plaze yer honour ; she's a born lady."

The gentleman laughed, and presented the "born lady" with a silver coin ; but Evelyn, who had risen, flushed crimson, and returned him the coin with any thing rather than an obliged manner.

"She's no beggar, yer honour," said Essy, herself half offended ; "nor are we beggars either, sir ; only we *take* what we *gets*."

"I daresay you do," he replied, taking the hint and transferring the coin ; "and now, take me to your aunt, and I will hear this child's history."

It was soon told, and, as it happened, the gentleman was a well-known oculist, and with much kind feeling told Margaret that if she liked to bring the child to his house in Dublin, he would see if any thing could be done for her ; and the coach being mended, departed, as visitors always do from the dwellings of the Irish poor, overwhelmed with blessings.

Margaret was not slow at perceiving and feeling "the divided duty" which this proposal led to—her brother and his children on the one hand, little Evelyn and her promise to Garrett O'Dwyer on the other—and, in the fullness and simplicity of her heart, she called her brother Murtoth to share its councils.

"It's a poor case entirely to leave you, Murtoth, and Essy so wild, though Mary to be sure is a rock of sense, considering her years ; but Essy's cruel wild, though Mary's head is long, and she can spin, sew, make, and, what's better, mend as well as myself ; and sure it's proud I am to see you go to yer work as clean as any gentleman, and the cabin, God be praised, as white as the priest's vestment (God bless us) ; and all that's a comfort any how ; and the dawshy craythur, poor little Evelyn, bird of beauty that she is ! has no one but me to look to her, and if the grace o' God would beam down on her, and restore her her sight, sure I could tache her many a thing against the time she'd see him."

"True for ye, Marg'ate, it would be a comfort to me, let alone you ; only don't say, sister, that the child has no one to look on her but you ; I know ye're the best friend any one ever had, but if you wasn't in it, sure I'd guard her myself—I would, for the honour of the family ! But go, sister : go to Dublin with her at

ons't, and what help I can raise for you I will, to send you comfortable on your journey. It's yer duty, Marg'ate, to the family, that's what it is ; and a proper duty to do, and God speed ye with it. And don't be fretting while ye're away, though it's a good step* to Dublin ; only *take it easy*, and I'll go bail Mary will mind the place and the pigs, and every thing that away. And ye'll write to us, as *you're the larning*, and maybe my prayers wont be with ye ! Only go, Marg'ate, astore ; and, sure, if she's restored, it's a bright girl she'll be, as well as a beautiful. If she's not, why, sure, we must only do the best we can for her ; and, any how, the blessing has been in it, ever since she set foot among us. I know you've a heart good enough to stay, but yer duty is to go amongst the strangers, if it would do her good ; we've been followers of the family for more than two hundred years, an' it isn't now we'd give in at the heel of the hunt."

This disinterested conduct on the part of poor Murtoth needs no comment, and Margaret prepared for her long and fatiguing journey with the same cheerfulness as though she were dressing in her best for mass on a sunny Sunday. Margaret was not one who saw no difficulties, no obstacles in her path. She perceived and understood them all ; but she was a follower of the family ; and the more the little offset stood in need of support, the more did she feel it her duty to protect and shelter it. The next Sunday the priest took occasion to address his congregation from "the altar," and to tell them that Margaret Shiel had resolved to go to Dublin, to see if it would please the Almighty God to restore the sight of her eyes to the child she had promised to watch over. The priest was a kind-hearted man, and knew the character of the people he addressed ; he first of all made his congregation laugh, by declaring what an advantage it would be to men if all women were blind to their faults, any way, and then aroused their sympathies in behalf of the heroic exertions of Evelyn's nurse. Nor was this all : when he saw his congregation wiping their eyes, and turning them towards where Margaret and Evelyn were, he urged them to give something even of the little they possessed to forward so good and pious an object. He told them that by so doing they would receive in this world the prayers and blessings of grateful hearts, and do a deed acceptable in the eyes of the Almighty. Whatever of superstition was mixed up with this kind-hearted man's discourse, I do not know : it was delivered long before I was born ; but an old man who heard Father Roche's address on the occasion, told me there was not a dry eye in the chapel, and that a purse, long and heavy with brave big and little money, was the result of his appeal. The times are bad, indeed, with Paddy, when he has nothing to give.

Murtoth Shiel was unprepared for the priest's address, and in the chapel-yard he thanked him from the overflowing of his heart, and assured his neighbours that one time or other he'd hope to make it up to them. Murtoth's tears evinced his sincerity ; and when a week afterwards Margaret and Evelyn's preparations were completed, and they were about to depart, it would be impossible to imagine a more kindly crowd than waited to bid them farewell. Evelyn was kissed, and crossed, and blessed, and the best horse and car in Tullygarrett, with a feather bed, and a patch quilt spread over it, prepared to take them "a piece of the way," and every woman that had an old shoe on, threw it after them "for good luck." And it was hard to tell whether Margaret laughed or cried most ; she did a good deal of both ; but it was not until having embraced her beloved brother for the last time, and called her niece, Mary, twice back to hear more "last words" touching various cottage matters, and having from the brow of the hill on which she stood watched the car and its attendants descend into the last hollow, that she felt the utter loneliness of her situation ; and pressing Evelyn, who understood and participated in

* Little pig.

* Bit of wood.

* A long way.

† Clever—intelligent.

her feelings, to her bosom, fairly burst into the passionate tears, which a sense of her loneliness, and the length of her journey, called forth.

In this railroad age, it is hard to imagine the toil and difficulty of a journey from Tullygarrett to Dublin; it was both tedious and painful, although safe, as travelling in Ireland always is. Margaret had more than eighty miles to walk. When Evelyn was fatigued, she carried her on her back, for the roads were then but little frequented, except by the country car-men at stated periods; and now and then a heavy lumbering coach, which seemed built for eternity, groaned past, heavily laden with luggage and passengers; and sometimes the guard would "give her a lift," which lightened her journey, and afforded her the opportunity of conversing with her fellow-beings. As yet she had spent but little of the generous gifts she had received; and though very much fatigued one night in particular, that Evelyn had been faint, and weary all day long, consoled herself with the information she had just obtained, that it was only fifteen miles to Dublin. The next morning her precious charge was weak and feverish; poor Margaret herself felt that she too was very unwell, but having said her prayers, she dressed herself as usual, and prepared for her departure. It was evident that Evelyn could not walk far, but her nurse longed with the impatience of a fervent spirit for the conclusion of their journey, and knew that every mile would diminish the distance. She therefore tied Evelyn on her back, in a way peculiarly Irish, and set forward.

She had not, however, journeyed more than three miles, when she felt her own strength sensibly diminishing. She was sick at heart, her head became dizzy, her limbs refused to perform their office, and the dreary landscape through which they were passing danced before her eyes. She unfasted the cloak, and sat down beneath the shade of a solitary tree, whose leaves rustled in the hot wind that swept the common, but whose breath was scorching, not refreshing. When her cloak was untied, little Evelyn crawled rather than walked from beneath its folds, and Margaret, as she pressed her own parched lips to her burning brow, muttered, "Now the Lord in his mercy look down upon us, for it's the fever, or something worse, that's over her; and, as to me, God help me! the hot and could shivers will shake the life out of me soon." Evelyn laid her head on her nurse's shoulder, and moaned heavily; Margaret observed that her eyelids were swollen, her face red, and her hand dry and hot. She thought that the same illness had seized both; she was mistaken; the child was attacked only by measles, but she herself had been seized upon by the fearful fever whose ravages have from time to time rendered the cottage homes of Ireland desolate. Overwhelmed by a lassitude she could not overcome, she wound her arms round her charge, and fell into a deep but painful slumber.

When she awoke, Evelyn was still sleeping, and though in a species of half delirium, she had not altogether lost her consciousness. She attempted to rise, but her strength was prostrated; she could not even move; her lips were unable to convey to the air the incoherent but fervent prayers she framed to the Almighty for the bestowing of his care on the sleeping child. The sun had set, and she was not in sight even of a dwelling; the only thing upon the dreary waste that indicated her proximity to a human habitation, was a lean spectral-looking grey horse, who had limped towards them, and after gathering with his skinny lips a few leaves from off the young shoots of the thorn-tree, stared pitifully in her face, as if to say, "hail, fellow-sufferer!"

Before the evening closed, the owner of the horse, a poor man called Larry Twist, who lived by making mats of the rushes cut from the swamps, and manufacturing fern brooms, came to seek his poor grey horse, and soon saw that one if not both of those beneath the tree were affected by the pestilence which had been ravaging that part of the country for some time.

In such cases the peasantry never totally desert each other; they dare not, of course, bring the infected parties to their houses; but before the next morning dawned, this good Samaritan had, with the assistance of a neighbour, erected a sort of shed over the sufferers, so as to protect them from the inclemency or heat of the weather, and placed a comfortable quantity of dried heath beneath them. Nor was this all: from time to time milk was begged for by the poor man "for the travellers, God help them, who war struck by the way, and no one to see to them, only just the Almighty, and maybe a slave like himself, who had nothing to give." This milk was pushed towards them with a long wattle; and Evelyn, whose childish disease lightened in a day or two, made a wonderful nurse in her turn, and well merited her name of "the blessed." She would sit all day long, her sightless eyes bent towards "her mammy nurse," whose head she supported on her little lap, replying to the ravings which conjured the whole world to take care of "her blessed Evelyn," with the assurance that "sure she was taken care of;" an assurance which the poor patient could not comprehend. By degrees Evelyn learned to guide herself round the tree, and from under the shelter of the hut, and her quick ear could distinguish the barefooted and nimble tread of those who shared with her their poor food, and begged for her support from the "big house." Sightless as she was, poor child, the sweet tenderness of her nature was to her instead of sight; and she watched, without seeing, her fainting and fading

friend—without being able to discern the frightful ravages which fever was making with the being she loved.

When the crisis came, and every faculty of life was suspended, when she could neither feel Margaret's heart beat, nor the breath from between her lips, then, indeed, Evelyn shrieked, and ran out upon the waste, clasping her little hands, while the tears gushed from her eyes, and the black crow rose heavily on the wing, croaking his displeasure at the disturbance. There was none but the crow to answer her cries of distress, for the mist of morning was heavy on every blade of grass; but as the day advanced, when the sun rose, the birds of the morass, and those who shelter amongst the gorse and furze, commenced the business and pleasure allotted to the span of their existence, Evelyn, exhausted by her cries, had sunk upon the heather, and, prevented by the innate dread of death which makes the blood run cold when we grasp the damp heavy weight, for the last time, of the beloved hand which never was cold to us before; impelled, I say, by this untaught innate dread, poor Evelyn feared to return to the hut, when all at once a lark sprang from beside her, and soared, and soared, into the very heavens, flinging its music with the prodigality of abundance, until it mingled with the fleeciness of the morning clouds; and the child's feelings, softened by the melody into a gentler sorrow, subsided. She loved the song of the sweet wild bird. She no longer screamed or sobbed, though the tears flowed on. She almost restrained her breath, and turned her face right upwards, that she might not lose the fragment of a sound! It was a picture to look upon. Gradually rising from the ground, she rested on her knees upon the wild heath, with nothing intimating the presence of humanity within reach, save the crouching temporary hut, and a red cloak hanging with picturesque effect above it, from amid the green branches of the solitary tree, which stood out, in strong relief, against the clear firm-looking sky.

So absorbed were her senses and feelings, that she did not hear the approach of her constant friend Larry Twist, who, in addition to the half-filled noggin of milk, had brought her on this morning a fragment of barley-bread and three or four potatoes.

"An' what ails ye, *avourneen*," he said kindly, "to be saying yer prayers on the wet grass! Get up, *alanna*, and take this to yer mammy."

"She's stiff and cold," she replied, her tears and sobs recommencing as the knowledge of evil returned to her; "and no beat in her heart, and she wont open her eyes; I felt them."

Larry moved cautiously towards the hut, keeping, as he said, "the wind between them;" and after peering over the cloak, assured Evelyn "that it was only the lull of the fever," which assurance, though she did not understand it, conveyed hope to the child's mind; the hope was increased by his adding, "Eat yer breakfast, my corra! and thin take a turn at the prayers. God can raise her up still, if it is His blessed will to do so. And pray with all yer innocent heart and soul, *avourneen*—pray, do. The prayers of the innocent are sweeter to the Lord than the perfume of the flowers to us—God help us! Pray, my darlint, and God will hear you—poor blind lamb that ye are. I'll come back in the evening, *alanna*," and he muttered to himself while departing, "by that time she'll be either dead or better."

The child did as he desired. The day seems long to many a listless child of luxury, but Evelyn did not know what the word "dull" meant. Many a petted girl would not have been suffered to arise from her bed after such an illness as she had endured, and yet there she was, abroad in the breeze and the sunbeam, gathering strength; and having repeated half a dozen times the prayers she knew, she crept to her "mammy's" side, bathed her lips with milk, kissed her damp brow, then stole as noiselessly away, and plucking up long grass as if it had been long rushes, plaited them together, and forgetful, as blessed childhood always is, of the past agony when its hour is past, she warbled softly the most mournful of those beautiful melodies which the Irish children seem to imbibe with the air they breathe. The evening found her sitting by Margaret's side, and, watchful as a fawn, her benevolent friend did not approach this time unnoticed. She advanced to meet him.

"I'm sure it's near night, sur," said the child, "for the sun's gone to bed, and the birds are done singing. Tell me how mammy is now."

The poor man looked at the woman with exceeding caution, for the humbler Irish think a fever more than usually infectious when it is, as they call it, "on the turn." Faded as she seemed, there was an aspect of returning life about the face; it was pale and wan, but its rigidity was gone; a certain degree of apparent warmth was over the features, and the long lank hair was moist.

"Cover her up careful, *avourneen*," said the man; "keep her warm, and sit as far from her as ye can. Maybe she'll spake to ye in the morning."

"I can't sit far from her, sur, an' she in it," answered Evelyn. And the old man wept to see the tenderness evinced by the innocent child towards her protector.

Margaret lived. It would be impossible to describe, because, thank God, I can only imagine, the faintings and weakness that confined her for a long long time to the shelter of that miserable hut. The weather continued astonishingly dry for that weeping country, and at last Larry Twist, having informed her that he

was going a good piece of the way towards Dublin, and would give her and the "girlieen," God bless her! a lift on the same grey mare that had stared so woefully at her the day she sat in utter weariness of body and mind beneath the old thorn-tree, she once more commended herself to the Almighty protection, and departed with, if it were possible, increased feelings of affection towards Evelyn. In due time, pale and emaciated, she arrived in Dublin, and presented herself at the door of the oculist. What was her dismay at being informed, that, in consequence of severe ill health, he had quitted Dublin the day before, only the day before, for Bath!

This was indeed a blow the poor woman little expected. She calculated her small finances, and finding that they would afford her a deck passage to Bristol, and something more, she set forward, nothing dismayed at the idea of travelling in a strange country, but bent on the one great prospect of seeing her favourite restored to sight. She landed at Bristol, and, despite the weakness attendant upon sea-sickness, and her former illness, the following day found her at the door of the humane oculist in Bath. She knew enough of human nature, which it is the habit to call "knowing the world," to dress herself and Evelyn in their very best; and as Evelyn's best was somewhat grotesque, she attracted so much notice, which immediately on looking at her beautiful face deepened into admiration, that Margaret, though flattered, was somewhat alarmed at the number of persons who stopped and questioned her as to whom the child belonged to. The extreme delicacy of her features—the quantity and colour of her hair—the softness of her complexion—the length and darkness of the eye-lashes, that curtained her dim but beautifully formed eyes, rendered her, when spoken to, an object of deep interest. And more than one lounge on the beautiful gossiping streets of Bath followed, and lingered near the door at which Margaret knocked. The servant told her—the servants of good kind people are always civil—the servant told her that his master was very ill, too ill to see any one, much less perform an operation, and that she need not call again. The blood that for a moment had mantled poor Margaret's cheek, rushed back to her heart, and the domestic, fearing that she might faint, with great humanity permitted her to sit in the hall.

"Tell him—just tell him," she said to the man, "just tell him, if ever ye hope to meet yer father and mother (God be good to them!) in paradise—tell him that it's the woman from the far Irish moor—she that lived in Tullygarrett—she, with the fair party child, Evelyn O'Dwyer, that never can see a glimpse of the blessed light of heaven, until it please God and his honour to grant it. I was seized by the fever on the road, and missed him on its account in Dublin, and now I shall miss him again, and the craythur may go stone blind to her grave, and never have the blessing to look in her father's face, if she should have the joy to meet him!" Many more were her prayers and words, and at last they prevailed. The servant told his master, who, kind as he had ever been, consented to receive the nurse and her charge in his bedroom. His days, however, were numbered, and he knew it; but he looked at Evelyn's eyes; and Margaret wept to observe how changed he was, for she well remembered the ruddy health of his countenance at their former meeting.

"I am sure it may be cured," he said, "and she could bear it; but I dare not venture on so delicate an operation now. I feel, my good woman, I shall never live to restore this child to sight, but she may remain here until I can see her no longer, and then I will leave you a letter to a London oculist, who, for my sake, will, with God's blessing, restore her sight."

Every day, while the good man was able to sit up in bed, was little Evelyn placed by his bedside, and the child interested him greatly. The nature of the disease was peculiar, and her intelligence and beauty no less so. Margaret's industry, her devotion and affection for her charge, made a strong impression in her favour; and before the gentleman died, he placed ten guineas in her hand, together with a letter to his London friend. This appeared to Margaret a mine of inexhaustible wealth, but her tears were no less sincere when she saw the remains of the excellent friend whom "God has raised up to her," consigned to the tomb. It was indeed a bitter trial, and she left Bath with an aching heart. Every thing was new and strange; she felt, as she said, "going through a dale of grandeur without a heart, and in the midst of it all no tidings of the boy." Margaret was too long-headed to travel in the heavy and expensive coaches of those days, or even in a waggon; she determined to "walk it," with an occasional "lift" from a passing vehicle. But the English were not as ready to give the "lift" as the Irish had been; they valued their time and the labour of their horses at a much higher rate than she had expected, and the refreshment and bed at the wayside inns were always to be paid for. She had journeyed considerably past Reading, when, overcome with fatigue, she stopped at a cottage which seemed far removed from a village, and requested a drink of milk for the child, and one of water for herself. The woman answered the petition with a tolerable grace, and her husband, struck by the beauty of the child, added to the gift a second draught of milk.

The woman sneered; "the rebellion in Ireland," she said, "had driven those away from the country who had made it too hot to hold them."

It was the first time Margaret had heard of "the rebellion," which unhappily formed so terrible an epoch in Irish history. She inquired the meaning of the words, and the woman gave her a paper, saying, if she could read, that would inform her better. Margaret could and did read, what made her heart both beat and bleed. The rebellion had raged in her part of the country; the cruelties of both parties had been great; and the little village of Tullygarrett had been the scene of frightful tumult. This was agony to poor Margaret, and little Evelyn threw her arms round her neck, exclaiming, "I hear ye're in trouble, my own dear mammy nurse; oh, do tell yer darlin' what ails ye." She could make no reply. Her brother probably murdered, her nieces without protection, in the fearful tumult of civil war, were before her! She considered if she were to go back, what could she do for them!—where find them? Besides, if she were to turn from her duty now, Evelyn would go "dark" to her grave, and the follower of the family have lacked in duty. This decided her on proceeding, though with tearful eyes and a beating heart; and whenever she saw a group of men assembled together, she would stop and listen, and if she dared venture, would ask a question as to "what news from Ireland?" Alas! England has always news of tumult from that poor country; but at that period the execrations and bitterness heaped upon it knew no bounds. Now, indeed, it is not so; England understands the country better. Many were the trials of poor Margaret's fidelity; and when she entered the long straggling village of Hammersmith, she had already discovered that ten pounds was not the inexhaustible fund she had imagined—travelling for the poor in England and Ireland were two distinct things. She presented herself at the door of the fashionable oculist, and her letter of introduction—the letter, one of the last her good friend had written—gained her immediate admittance.

"Several weeks" must elapse, the doctor said, before the child could be couched, and he would perform the operation for the sake of his old friend. "Several weeks," thought Margaret; "and how are we to live! This won't last for ever, and we so far from our own home, where the 'hearty welcome' is in every hand and on every lip. Well, I must work any way I can; and so best; it will keep me from thinking!"

But poor Margaret's work was not London work; spinning and knitting were despised; there were no potatoes to dig, no corn to bind, no turf to clamp. Margaret was for a time at a loss for labour; but it is marvellous to the idle how the industrious will make employment. She was always ready to do a "hand's turn" for her landlady, who discovered that she had an Irishwoman in her house, who, though awkward in "her ways," was clean, active, industrious, and not quarrelsome. This was new, and useful. Under other circumstances, Margaret would have been cheerful; but how could she be cheerful! The Irish disturbances were to be exterminated rather than extinguished; and though she had written to both "priest and minister" concerning her brother—written in her own way, but so as to be intelligible to both—she had received no reply. She had also to bear the galling and ignorant taunts which the lower class of English, for want of knowing better, are too apt to heap upon the inhabitants of their sister kingdom, who work for less, and endure more, than they think right or proper that any body should. But Margaret humbly and faithfully prayed to, and trusted in, God; and though her troubles were many, they were lessened, not increased, by time. She managed, by hard labour, to earn a few shillings each week, so that the remaining portion of the ten pounds remained untouched. "It was intended for her, not me; and God knows what trial may be before her yet, besides the pain, in this strange country." It is a mistake to suppose that the poor Irish set their faces, in those bygone days even, against education; persons who live and observe the peasant part of the community, cannot fail to observe that, on the contrary, they are an exceedingly curious and investigating people, anxious to obtain information in the quickest possible manner, the elders not persevering themselves, but wishing that their children should persevere in "their schooling," if they do so in nothing else. Margaret had a great desire that her blind charge, now nearly eight years old, should learn as much as possible; and when evening came, and her daily labours were terminated, the wash-tub deserted, and the scouring concluded, she would sit down and read to her, not perhaps the sort of books we should recommend now-a-days; but a book was a book to Margaret, no matter what was in it. She read on, until in general she read Evelyn to sleep. She had brought her own Prayer-book with her, a dilapidated "Reading made Easy," a "Valentine and Orson," one or two fairy tales, an old "Voster's Arithmetic," and the "Vicar of Wakefield," that had belonged to "Master Garrett." Moreover, there was a volume of O'Halloran's History of Ireland, which she regarded with great veneration, marked with the armorial bearings of the O'Dwyers.

Evelyn never went to sleep when her nurse read her "the Vicar of Wakefield," and she knew the poem of the Dog by heart. This was a consolation to Margaret. At length the doctor intimated his intention of couching one eye, and Evelyn attended with Margaret at his house. The operation was performed to the oculist's satisfaction, who praised the child's extraordinary firmness, and called her nurse into an-

other room, to give her some private directions as to her treatment; having done so, he said in his usually abstracted way, "O'Dwyer, O'Dwyer!—I met a very clever gentleman yesterday of that name; as handsome a young fellow as ever I saw in my life."

"O'Dwyer, a gentleman—handsome, did you say, sir?" asked Margaret, breathless, for whom the whole world contained only one O'Dwyer. "Ah, thin, will yer honour just be pleased to tell me where he is?"

"Why, really, I believe he leaves London to-day, but you cannot possibly know any thing about him, I should think. He has been in foreign service since his boyhood, and came over with General—bah! I never can remember names; should not have remembered his, but that it struck me as being the same as this child's. He seemed very anxious, too, about Irish affairs; first time he had been in these countries for many years."

Even Margaret's strong interest respecting Evelyn's sight was for a few minutes overwhelmed by her desire to hear something more about the "handsome young fellow," who she was certain must be "Master Garrett."

"I can't help thinking," she said, after a pause, "I can't help thinking, please yer honour, that he's yon darlin's father."

"Much too young for that; he cannot be more than four or five and twenty."

"Please yer honour, he was all as one* as a boy when she was born, and the Garretts were always young-looking of their age. I'd give the eyes out of my head to see him, please yer honour."

"My good woman," said the matter-of-fact Englishman, "that would be impossible: if your eyes were out, you could not see him. But I do not think it can be he." His personal beauty seemed to have made a great impression upon the doctor, for he added immediately afterwards, "He certainly is a remarkably fine fellow, and appeared much amused and pleased by the attention which sundry ladies paid him."

"That's natural enough to all Irishmen; indeed, I believe, to men of all countries," said Margaret; "and small blame to them, if the ladies forget themselves so far as to pay gentlemen attention. But did ye hear his Christian name, sir?"

"Not hear it—but I have a note of his somewhere, a line I received yesterday—a question about the utility of a particular glass, which he wants to give to some old soldier."

"That can be no other than himself. Oh, for the love of God, try and find it, sir!" exclaimed Margaret. "Do, yer honour; it might be the saving of my life, the saving of the child; nothing can make you know what a scrap of his writin' would be to me."

"That is, my good woman, supposing it is his writing," replied the gentleman, as with great good nature he tossed over various letters and papers. "Here it is; no: that is not it." Picture to yourself the keen anxiety of Margaret's blue eyes, the trembling of her whole frame, the torrent of hope that burst upon her, the shivering dread lest it might not be "Master Garrett," the reproaches she heaped in her own mind upon the oculist for being tardy and awkward—imagine all this, and then hear the doctor, after unfolding a note and casting his eye down the page, say, "Yes—here it is at last—GARRETT O'DWYER."

CONSTITUTION OF THE CHAMBER OF DEPUTIES IN FRANCE.

GREAT as is the resort of British travellers to Paris, close as is the connection between France and Great Britain, politically, socially, and commercially, vast as is the influence exercised by France in Europe, an astonishing degree of ignorance prevails in this country regarding not only the public men, but also the state of political parties in the Chamber of Deputies, the representative assembly of France, and the potential instrument of its government. A few words, therefore, upon the subject, will scarcely be considered misplaced.

Previous to the revolution of July 1830, there were only two distinct parties in the Chamber of Deputies, the adherents of the existing dynasty of the Bourbons, the defenders of all the measures of the crown, and the advocates of a more popular order of things than was agreeable to the court. The first party ranked as its most distinguished upholders in the Chamber, M. Clauzel de Coussergues and M. de Laboulaye, and the other, General Foy and Casimir Perier. A yet more liberal section of the latter party was led by M. Benjamin Constant.

The displacement of the elder branch of the reigning house, and the election of the Duke of Orleans, under the title of Louis-Philippe, to the throne—calling the old opposition to power, that opposition which is styled in French publications "the fifteen years' opposition," dating its existence from 1815, the era of the restoration—had the effect of splitting that party into several subdivisions. This was a consequence inevitable from the nature of things. Men may be long and intimately united together in opposing what they deem the harsh exercise of power, who, when they succeed in laying that power prostrate, lose the bond which kept them steadfast to each other, and

endeavour to make that particular opinion to which each was originally, though perhaps unavowedly, disposed, the predominant feature of the change.

Before proceeding with the immediate object of this article, it may not be inappropriate to state succinctly what is the present constitution of France under the charter promulgated in 1830. 1st, The king, who holds his place by election. His situation is analogous to that of William III. in England, who also was elected; and the same question has been raised there as here, whether the crown is really held by pure election or by right of birth. An order of French politicians has invented the term *quasi-legitimate*, meaning thereby, that, in the absence of the oldest branch, the crown of right fell to the house of Orleans. This discussion, seemingly merely theoretical, is of vast importance, as it involves the point of the sovereignty of the nation, speaking either collectively or through its representatives. Practically, it is at present of little moment, and the monarch of July exercises all the powers of the executive in as full a manner as royalty in this country. 2d, The Chamber of Peers, the members nominated by the king, and holding their station for life only. It possesses a co-ordinate jurisdiction with the Chamber of Deputies; but as it is so immediately dependent on the crown, its legislative character has fallen into disrepute and disregard, and its functions are now mainly invoked for the condemnation of state-criminals. 3d, The Chamber of Deputies, elected in different proportions by the eighty-six departments of France (including Corsica), the elective franchise being vested in those only who pay 200 francs (L.8, 6s. 8d.) per annum of direct taxes. This limitation reduces the constituent body, in a population of 33,000,000, to about 170,000, who compose in fact the middle class in the country, in whom it was the object of the charter to deposit the effective controlling power. The Chamber consists of 459 members; and whilst the ministers of the crown are eligible to sit and vote in it, they are, whether members of it or not, entitled to address the Chamber on government measures from the tribune. The electoral body votes for representatives by ballot, and the decisions of the Chamber are likewise pronounced by black and white balls dropped into an urn, which operation does not seem, however, to prevent the vote of each member being quite well known. An absolute majority of the voters present is indispensable to the adoption of any measure or nomination by the Chamber. Upon the assembling of a new legislature, the Chamber elects for its officers a president, four vice-presidents, four secretaries, and two quaestors. The control of the public purse is exclusively vested in the deputies, and indeed, practically, the whole system of government is in their hands. Hence the necessity of knowing, as nearly as is practicable, its component but disjointed parts.

The difficulty of giving an accurate picture of the Chamber may be appreciated from the fact of there having been no less than twelve distinct ministries within the last nine years, without mentioning important modifications undergone by them in their careers. The fluctuations of opinion may be easily conceived, from this circumstance alone, to have been very great. In fact, although the same men have been on the stage as leaders for the whole period, they have so changed their positions and modified their opinions and principles from time to time, as to render it nearly impossible to present any one or more among them as the same or nearly the same at any two periods. A slight glance at the different administrations will serve to confirm this statement. The first that was formed after the revolution of 1830 was without a president, but M. Guizot, as minister of the interior, was its most able member. Molé, Dupin, Lafitte, and Perier, belonged to this ministry. In three months it was at an end, and M. Lafitte was placed at the head of a new and more liberal ministry, formed on the 2d November 1830. It gave way to the moderate ministry of Casimir Perier, named president on the 13th March 1831, Soult, Montalivet, and D'Argout, forming part of it. On the 16th May 1832, Perier died of cholera, but his ministry hung on without a president until the 11th October 1832, when Soult became president, and for the first time Thiers and Guizot sat in the same cabinet. This administration underwent two important modifications previous to the 18th July 1834, when Soult was displaced, at the joint request of Thiers and Guizot, and Marshal Gérard became president. On the 27th October 1834, the whole of the ministers resigned; and on the 10th November 1834, the Bassano cabinet was formed, which has become famous in official annals as holding place for only three days. The 18th November witnessed the re-nomination of Thiers and Guizot, under the presidency of Marshal Mortier. In February 1835, Mortier was dismissed, and on the 12th March, Broglie took his place. On the 22d February 1836, the rivalry between Guizot and Thiers having previously attained its height, an entirely new ministry came in, with Thiers president, and Montalivet, d'Argout, Passy and Sauzet, as members. This administration continued until the 25th August of that year, when it resigned, and on the 6th September, Molé and Guizot took office together. On the 7th March 1837, they were outvoted in the Chamber of Deputies, and they resigned. It was not until the 16th April that a new combination was effected, when Molé continued as president, Guizot was definitively dismissed, and Montalivet became minister of the interior. This administration

* The same.

lasted till the beginning of 1839, when, having resigned, after a long ministerial interregnum, Soult was again named president, Passy and Villemain forming part of his cabinet. It is this administration that is now in office. Sauzet at present occupies the presidential chair of the Chamber of Deputies.

From all these changes, it is sufficiently clear that a great variety of opinions must exist among the deputies, and that these numerous ministries have been formed of discordant materials, for the mere purpose of gaining a majority in the Chamber. This fact will be made more clearly perceptible by an allocation of the different parties, and an enumeration of the chief men belonging to each of them, so far as their own declarations or public opinion will enable us to perform the task.

The Chamber of Deputies, then, is composed, in general terms, of four great distinct parties, which, from their positions in the hall of assembly, are styled the right side, the right centre, the left centre, and the left side. These parties are strongly and emphatically divided from each other in principles. The first are Legitimists, or adherents of the old monarchy; the second, adopting the charter and dynasty of 1830, are disposed for a monarchical and aristocratical reaction, as opposed to the further development of the democratic tendency; the third are for giving the charter of 1830 full and unrestricted play; and the fourth advocate electoral reforms in different degrees.

But this enumeration gives only a general, and, in truth, a very inaccurate picture of the actual condition of parties. Each of these main divisions is split into two or more minuter sections; and especially with regard to the bulk of the Chamber formed by the two centres, from which all the ministries have been taken, such personal comminglings have occurred as most materially to modify and even subvert original positions and tendencies. From these minor subdivisions, and especially from these amalgamations, the true state of the Chamber may be represented as follows:—

First, the Legitimists are divided into two portions, chiefly on the point of taking the oath to Louis-Philippe and the charter of 1830, which is required before sitting in the Chamber. Certain of this party, with M. de Chateaubriand at their head, refuse to take the oath, and are therefore excluded. The others maintain they can swear to the requisite formula without being debarred from attempting the subversion of the present order of things. These, therefore, form the extreme right of the Chamber, and represent the principle of the divine supremacy of kings and of all popular liberties being held by royal grace, and not by right. Their number in the Chamber is sixteen or seventeen, but though so small a fraction, they possess a host in the person of M. Berryer, who is gifted with an eloquence quite unrivalled in the assembly. The Legitimist party has three talented organs of its opinions in the Parisian press, the *Gazette de France*, the *Quotidienne*, and the *Europe*.

Next to the Legitimists come the Doctrinaires, a title given to a party which holds very speculative opinions on the nature of governments. M. Guizot, one of the most eminent literary men of the present day in France, is at the head of this party. In theory, a highly intellectual and liberal range of thought appears to actuate the Doctrinaires, but in practice they are identified with very rigorous measures against the liberty of the press and the subject. The different attempts at insurrection and regicide that have been made since 1830, have been the pleas for this severity; but it has rendered the party unpopular in France, and it does not number above twenty-five in the Chamber at the present moment. Amidst a deluge of words, with which the Doctrinaires endeavour to elucidate or conceal their actual principles, these may be expressed as tending to the repudiation of the popular element, and to the concentration of power in the hands of men of superior mind, information, and capacity. The distinguished ability and eloquence of M. Guizot give to his section a much greater influence than its numerical force would otherwise entitle it to. The *Journal des Debats* is its principal organ in the press.

The right centre comes next, of which the Doctrinaires are generally considered a component part. Fundamentally, scarcely any difference of opinion exists between them, both being inclined to a reaction adverse to democracy, but in the last administration (that of Molé and Montalivet) a schism occurred; the Doctrinaires taking part against that ministry, and the right centre supporting it. M. de Lamartine, the celebrated poet and traveller, may be considered the principal member of this section, which numbers about thirty. Its journals are *Le Journal de Paris*, *La Paix*, and *Le Journal General*, though not exclusively so.

It is difficult to give a name to the party which follows. It is composed of the adherents of the Molé-Montalivet ministry, and includes draughts from the two centres. It approaches, in fact, as nearly as possible to what has been called the *juste milieu* position. Whilst maintaining the necessity of rendering the government strong and powerful, it recognises in its full extent the control over the executive held by the nation, and exercised by its representatives. It abjures all speculative inquiries into the origin and nature of governments, but adapts its action as expediently as it can to existing circumstances. This is by far the strongest section in the Chamber, and is undoubtedly the representative of the great majority of the middle

class in France. To keep things, foreign and domestic, as they are, is the preponderating feeling in the public mind. A coalition of all the other sections in the Chamber was required to oust this party, and the present ministry is actuated by pretty nearly the same principles, but its members are not so personally distasteful to the ambitious leaders of the assembly. This party, the old ministerial party as it is called, counts about 190 supporters, and with the men of the pure right centre reaches 220 or 221 votes, almost half the Chamber. Although there are some clever men in its ranks, such as Martin (du Nord), Jacqueminot, Cunin-Gridaine, Girod (de l'Ain), &c., it possesses no distinguished orator. The *Charte de 1830* is its chief organ in the press, though the three papers last mentioned may also be taken as its advocates.

We now come to the left centre. M. Thiers and M. Dupin are its stars of first magnitude. This party recognises the sovereignty of the people as a principle, but restricts its exercise to the limits of the charter of 1830. The maintenance of the principles of that charter, and of the dynasty consecrated by it, is in fact the ruling object of the party. In this tendency it is of course joined by the party immediately before described, but the left centre advocates a practical extension of those principles which the other resists as dangerous. In fact, its tendencies are far more liberal, and its adherence to constitutional freedom more firm and unflinching. Thiers and the whole of this party have concurred in restrictions upon the press and the right of meeting, but only under the pressure of threatening circumstances, for they join with an immense majority of the middle class in France in deprecating and resisting to the utmost any violent or sudden displacement of the existing state of things. This party is distinguished also for its inclination to a close alliance with Great Britain, and an antagonistic front to the absolute powers of the north. Its numbers in the Chamber may be estimated at 130. There are different shades of opinion amongst them, for Dupin and Thiers are not agreed on all points, but it is impossible to follow out these minute subdivisions. The journals of the centre-gauche are *Le Temps* and *Le Constitutionnel*.

All the parties that we have hitherto enumerated (with the exception of the Legitimists) adhere to the sacredness of the charter of 1830. We now come to parties who would break in upon that charter. They may be included under the term of "left side," but very different phases of opinion exist amongst them.

First comes the phalanx which was known a few months ago as the dynastic or constitutional opposition. It is led on by a very brilliant speaker, whose character is highly respected in the Chamber, Odilon Barrot. Its principles are an acknowledgment of the dynasty and constitution of 1830, but an assertion of the supreme sovereignty of the people in theory and in right. An extension of the suffrage, and various reforms, but under the aegis of monarchy, are its leading dogmas. A very talented portion of the Parisian press belongs to this party, *The Siecle*, *Courrier Français*, *Journal du Commerce*, and likewise the *Constitutionnel*. It reckons nearly 60 members in the Chamber. It is difficult to say whether three of the most distinguished men in that assembly, and, indeed, in France, namely, Lafitte, Mauguin, and Arago, are to be counted with Barrot, or with the leader we are about to name, whom they certainly, but perhaps temporarily, joined in 1837.

Last of all comes the extreme left, the advocates of universal suffrage and republicanism. M. Garnier-Pages is their orator and oracle. They number, at the most, 18 in the Chamber. Their journals are *The National*, *Bon Sens*, and *Le Monde*.

Thus we have gone through the entire Chamber of Deputies, and we see of what heterogeneous materials it is composed. The difficulty which all ministers encounter in getting such discordant elements to act in one direction, is a sufficient explication of the frequent changes of administration. Besides, substantial differences of opinion on political matters are evidently not the only stimulants to action amongst the public men in France, but combinations are made, and ministries formed or overthrown, from motives of personal ambition, pique, enmity, or affection, of which it is necessarily impossible to give any rational account. But these personal amalgamations and antagonisms render the task of classing parties and men by principles extremely difficult, for no sooner do the lines of demarcation seem distinctly laid, than new fraternities or estrangements occur, arrangements are all broken up, and the most unforeseen approximations and divergences are the result. So it may fare with all our laboured exposition in a few months, weeks, or even days.

Before leaving the subject altogether, we will hardly be deemed to decrease its interest, if we give what may be called the statistics of the Chamber, as far as documents will enable us to do so. There are nearly 200 members in the Chamber who hold offices under the crown, or are what are styled functionaries, in the different departments of Law, Foreign Office, Home Office, Commerce, Finances, Public Instruction, War, and Marine, and in the Royal and Princely Households. At least, in the Chamber returned in November 1837 there were 182 actual functionaries, and scarcely any material alteration occurred in the spring of 1839. In that Chamber also there sat 7 former cabinet ministers, 41 former functionaries, 21 retired military men,

53 lawyers (besides 80 counted among the placemen), 15 bankers, 57 merchants, and 15 iron-masters. The remainder was made up of literary men (the most distinguished of whom are ranked in other classifications), land-proprietors, agriculturists, notaries, physicians, members of the Institute, &c.

One extraordinary and striking fact may be remarked, namely, that not one of the most influential members of the Chamber belongs to the aristocracy of rank. They have all risen to eminence and distinction in the hierarchy of politics by their celebrity in the republic of letters.

NEW WORK OF MEDICAL ANECDOTE.

"PHYSIC AND PHYSICIANS, a Medical Sketch-Book; exhibiting the public and private life of the most celebrated medical men of former days, with Memoirs of eminent living London Physicians and Surgeons"—such is the title of a literary melange, in two volumes, published within the last few days. Not biography—not scientific history—burdened with scarcely any serious object of any kind, this is, nevertheless, we presume, a book well calculated for the times. All the facetious anecdote that has been preserved respecting the British medical men of the last two centuries, is worked up in it. The author has adopted a certain classification of the different departments of his subject. He has a chapter on eccentric medical men, two on the medical men distinguished in literature and science, one on quacks, one (perhaps the most respectably valuable) on the early struggles of eminent medical men, and finally two, respecting living physicians and living surgeons. The book is of that light and amusing kind, which is sure, wherever or whenever taken up, to enliven the passing hour; but a little more careful and judicious reflection might, in our opinion, have improved it considerably. As an example of the carelessness of the author on this point, the reader may compare what he says at p. 132, volume first, as to the fortuitous and extrinsic circumstances which have enabled physicians to attain eminence, with his declaration at p. 9 of volume second, that most eminent physicians have been indebted to their industry, zeal, learning, and perseverance, for their advancement, and that it may reasonably be predicated of all who place these industrious gentlemen before their eyes as models for imitation, that a similar success will crown their exertions. If he has here meant nothing inconsistent, he has certainly not expressed himself with sufficient precision. Let us pass, however, from all serious criticism of a work which only aims at entertaining, and perhaps only the more effectually secures that object, by not containing too much wisdom.

The chapter on quackery is but a sketch of a mighty subject, which volumes would not exhaust; but it is cleverly made up, and very entertaining. In one remark as to the inducements to visit quacks, the writer shows much acuteness—"we like to expect miracles in our own proper person." "There is something piquant," he remarks, "in the disdain for prudence with which we deliver ourselves up to that illegitimate sportsman of human lives, who kills us without a qualification." He acknowledges also, as reasons for the extensive trust in quacks, that health is offered by them at a cheap rate, and that patients are like drowning men who catch at straws. He unhesitatingly confesses, however, that quacks have often wrought cures where others failed, the cause being that the former, demanding implicit faith, work upon the imagination, and thus bring in a moral medication. "It is a singular thing," he says, "that neither thought nor study, nor apprenticeship, nor preparation of any sort, is necessary to accomplish the perfect quack. He springs out at once from obscurity and ignorance, completely consummate. Like Pallas, when she jumped all armed from the brains of Jove, so is the quack. He is cased all over in native brass, from top to toe—armed in scale, like the serpent, and like him, he is not wanting in fangs. Other pursuits require patience, time, reading, and long practice, before the profession is allowed to act. The lawyer studies five years, the surgeon, the physician, the apothecary, the painter, and the sculptor, as many; the shoemaker, the carpenter, the joiner, each has his long period of probation. But the quack has none! He is utterly ignorant of simples. The natures of the commonest herbs are unknown to him. He is ignorant of the alphabet of medicine. Yet he thrives; he runs laughing through (and at) the world.

When we declaim," he adds, "against the iniquity of quacks, we should at the same time laugh to death the folly of those who seek them. They are the cause of quackery. They are as much answerable for the spreading of the vice, as the mother is, who feeds her favourite fool with stolen sweets, and waits over his misdeeds at the gallows. If the gaping blockhead, and vapouring coxcomb, did not loiter and swagger

* London: Longman, Orme, Brown, and Company.

about the streets of London, with pockets crying to be picked, the picker would turn his hand to an useful trade. He would never require either the pump or the tread-mill. The followers of quacks are the cause of quackery. They are the cause of all the atrocious homicides that have ever been committed. One simpleton bears testimony to Mr Quackall's virtues; another to his manners; a third attests his wonderful cures. Nothing was ever so sudden, so certain, or so marvellous! His 'vonderful vonders,' as Mathews justly called them, are the theme of the tea-table, and the gossip of the nursery."

A number of anecdotes of quackery, long past and recent, are hit off by the author with a good deal of comic effect: we extract a few.

"Some time since, a *soi disant* quack doctor sold water of the pool of Bethesda, which was to cure all complaints, if taken at the time when the angel visited the parent spring, on which occasion the doctor's bottled water manifested, he said, its sympathy with the fount, by being thrown into a state of perturbation. Hundreds of fools were induced to purchase the Bethesda water, and watched for the commotion and the consequence with the result to be expected. At last one, less patient than the rest, went to the quack, and complained that though he had kept his eye constantly on the water for a whole year, he had never yet discovered any thing like the signs of an angel in his bottle.

"That's extremely strange," exclaimed the doctor; "what sized bottle did you buy, sir?"

Patient. A half-guinea one, doctor.

Doctor. Oh, that accounts for it. The half-guinea bottles contain so small a quantity of the invaluable Bethesda water, that the agitation is scarcely perceptible; but if you buy a five-guinea bottle, and watch it well, you will in due time see the commotion quite plainly, sympathising with that of the pool when visited by the angel.

The patient bought the five-guinea bottle as advised, and kept a sharp look-out for the angel until the day of his death."

"Mantaccini, the famous charlatan of Paris, was a young man of good family, and having in a few years squandered a large estate, and reduced himself to beggary, he felt that he must exercise his ingenuity or starve. In this state of mind he cast his eyes round the various devices which save from indigence, and are most favoured by fortune. He soon perceived that charlatanism was that on which this blind benefactress lavished her favours with most pleasure, and in the greatest abundance. An adroit and loquacious domestic was the only remaining article of all his former grandeur; he dressed him up in a gold-laced livery, mounted a splendid chariot, and started on the tour under the name, style, and title, of 'the celebrated Dr Mantaccini, who cures all diseases with a single touch, or a simple look.'"

Not finding that he obtained as much practice as his daring genius anticipated, he determined to resort to still higher flights. He left Paris, and modestly announced himself at Lyons as 'the celebrated Dr Mantaccini, who revives the dead at will.' To remove all doubt, he declared that in fifteen days he would go to the common churchyard, and restore to life its inhabitants, though buried for ten years. This declaration excited a general rumour and murmur against the doctor, who, not in the least disconcerted, applied to the magistrate, and requested that he might be put under a guard to prevent his escape, until he should perform his undertaking. The proposition inspired the greatest confidence, and the whole city came to consult the clever empiric, and purchase his *baume de vie*. His consultations were most numerous, and he received large sums of money. At length the famous day approached, and the doctor's valet fearing for his shoulders, began to manifest signs of uneasiness. "You know nothing of mankind," said the quack to his servant; "be quiet." Scarcely had he spoken these words, when the following letter was presented to him from a rich citizen:—"Sir, the great operation which you are going to perform, has broken my rest. I have a wife buried for some time, who was a fury, and I am unhappy enough already without her resurrection. In the name of heaven do not make the experiment. I will give you fifty louis to keep your secret to yourself." In an instant after, two dashing beaux arrived, who, with the most earnest supplications, entreated him not to raise their old father, formerly the greatest miser in the city, as, in such an event, they would be reduced to the most deplorable indigence. They offered him a fee of sixty louis, but the doctor shook his head in doubtful compliance. Scarcely had they retired, when a young widow, on the eve of matrimony, threw herself at the feet of the quack, and, with sobs and sighs, implored his mercy. In short, from morn till night, the doctor received letters, visits, presents, fees, to an excess which absolutely overwhelmed him. The minds of the citizens were differently and violently agitated, some by fear, and others by curiosity, so that the chief magistrate of the city waited upon the doctor, and said, "Sir, I have not the least doubt, from my experience of your rare talents, that you will be able to accomplish the resurrection in our churchyard the day after to-morrow, according to your promise; but I pray you to observe that our city is in the utmost uproar and confusion, and to consider the dreadful revolution the success of your experiment must produce in every family; I entreat you, therefore, not to attempt it, but to go away, and thus restore tran-

quillity to the city. In justice, however, to your rare and divine talents, I shall give you an attestation, in due form, under our seal, that you can *revive* the dead, and that it was our own fault we were not eye-witnesses of your power." This certificate was duly signed and delivered, and Dr Mantaccini left Lyons for other cities to work new miracles. In a short time he returned to Paris, loaded with gold, where he laughed at the popular credulity.

Among our notices of distinguished quacks, we must not omit to mention the celebrated Count Cagliostro and his lady. They pretended to a knowledge of a practice, whereby everlasting youth might be obtained. The roses were to flourish in unabated beauty upon the cheek of age without the aid of cosmetics.

This couple first made their *début* at St Petersburg; the countess, who was not more than twenty, used to speak, without the least affection, of her eldest son, who had been for a long time a captain in the Dutch guards. This phenomenon of grinding old people young, in so visible and charming a manner, could not fail to astonish the ladies. They flocked to consult her; she advised them to use the count's nostrum. Treasures flowed in: true, the ladies did not grow young again, but their lovers assured them they did; and Cagliostro was almost deified.

So well did this worthy couple play this game, that a great Russian prince became sensible to the charms of the countess. The empress heard of it; she summoned the syren to her presence. The countess lied so well and so audaciously, that it passed for currency, and her absence was bought by a present of 20,000 roubles! A Russian mother, whose child was dying, gave 5000 louis d'ors to recover it: the count engaged to do so, if he were allowed to take it home for eight days; the child was returned healthy and well, but it did not happen to be the same; he had bought one, after having burnt the original child that would die, to make an experiment of regeneration: all this he confessed. The money was required back, but the usual answer, 'No money returned,' was the result. They then favoured Warsaw with a visit, and adroitly enlisted on their side the priests and the poor. At this city, and at Paris, these impostors realised large sums of money. Morality and decency forbid us from entering into a minute detail of the abominations which they had recourse to, in order to effect their nefarious purposes.

An empiric of the first water, not many years ago, had made himself famous for the cure of all human maladies, by the administration of peculiarly large pills, of his own invention. What contributed not a little to the increase and spread of his reputation, was the fact, that he used frequently to tell his patients, that, from their symptoms, he was confident some particular substances were lodged in a portion of the alimentary canal. At one time he would tell a patient that he had apple-seeds retained in his bowels; and, again, he would tell another that he had kernels of different fruits and grains in his stomach; and if by questioning gentlemen, he could ascertain that they were fond of shooting, it was not seldom that he attributed their complaints to having accidentally swallowed a few shot. As nothing could so conclusively prove his prognostics correct, as the simple fact of finding the articles named, the quack's character for wisdom and skill became more and more firmly established; for the identical causes of mischief were invariably discovered, after taking a dose of the 'big pills.' At length, a lady of the first respectability, having suffered a long time from deranged digestion, applied to this celebrated quack for assistance. After a few questions, he told her very promptly that he understood her complaint, that he knew what ailed her, and, more than all, that her doctor was a fool; and assured her that his big pills would effect a cure. Neither of these assertions she exactly credited, but, nevertheless, concluded to try his remedy, if he would make known to her the complaint. 'Why,' says he, 'you have got lemon-seeds in you—you must take some of my "big pills," and get rid of them, and you'll be perfectly well again.' 'Why, doctor,' said the lady in amazement, 'I have not eaten a lemon these six years, and what you say is quite impossible.' 'No matter, madam; if you have not ate a lemon for twenty years, the fact is just as I tell you, and if you will take the pills, you can be satisfied yourself.' The pills were taken, and to the utter astonishment of the patient, the lemon-seeds were found; a second dose was taken, and still more seeds made their appearance. A thought now flashed upon the lady's mind. One pill was yet left, which she examined, and, behold! a *lemon seed* in its centre—the secret truly of the doctor's astonishing wisdom and successful practice.

No subject," the author adds, "calls more loudly for the interference of the legislature than that of quackery. Yet, the question has so many ridiculous sides, that the public, while they laugh, allow imposition of the most palpable kind to flourish and succeed. It is indeed characteristic of this nation, that the grossest public injuries affecting the state, or the public health, are overlooked, while they afford materials for joke and merriment. When, in gazing into a print-shop, we see the representation of a patient who has been dosed, *usque ad nauseam*, with the 'vegetable pills,' sprouting out in luxuriant vegetation, as the effect of the medicine taken, to look 'grave, exceeds all power of face,' and the misery, wretchedness, pain, and death, which we know to have resulted from the use of

the nostrum, is forgotten in the midst of the ridiculous ideas which the print excites in our mind."

"Having considered the question in all its ramifications, the writer [of an article in the Medical Gazette for March 1839] considers that to diminish quackery three things are especially required:—

1st. The improvement of our art. This will lessen the number of those who take nostrums from despair. It is by advancing the art which he practises, that every one must strive to show that his long and expensive education has bestowed upon him a privilege, which the legislature need not guard by penalties—the privilege of discernment.

2dly. The diffusion of knowledge on medical points, with particular reference to the danger of many drugs, and the absurdity of using any at random, by drawing them from the wheel of chance at a patent-medicine shop. This will diminish the number of those who fall into the clutches of the charlatan from ignorance and caprice.

3dly. It is necessary to make good advice accessible to every one. Clubs or societies for the insurance of health must be formed on easy terms, and this will withdraw thousands who now fall a sacrifice through poverty."

With the above observations we fully concur; and if the profession could be persuaded to take the proffered advice, and *act up to it* with spirit, the infamous hydra-headed monster would receive a mortal blow, and both the public and the faculty would be greatly benefited by the result."

SIR WOODBINE PARISH ON SOUTH AMERICA.*

THE Republic of La Plata comprises the whole of that vast central portion of South America lying between Brazil and the Cordillera of Chile and Peru, and extending from the 22d to the 41st degree of south latitude. In this space are included not less than 726,000 square miles English of territory. The country, however, is thinly peopled over its whole extent, the numbers of its inhabitants ranging between 600,000 and 700,000. Of this immense region, Sir Woodbine Parish, who was long charge d'affaires for Great Britain at Buenos Ayres, gives, in the work before us, a concise yet comprehensive account, in which the past history, the present political and statistical condition, and the various geographical and geological features of the country generally, as well as of its many provinces individually, are laid clearly before the reader. To attempt to follow Sir Woodbine methodically over so wide a field as this, would be improper here. Greater justice will be done to the work, and more satisfaction given to the reader, by making a few extracts, isolated though the character of these must of necessity be.

Buenos Ayres, the capital of the republic of La Plata, of course receives a large share of our author's notice. It has long been a considerable commercial port, and now contains about 200,000 inhabitants, of whom all but a very small proportion are of white or European descent. The city stands on the south bank of the estuary of La Plata, and is built in the accurate fashion usually prescribed by the Council of Spain, resembling a draught-board more than any thing else. Buenos Ayres is one of the few places in South America, where the overturn of the Spanish authority has as yet been productive of any decided benefit. The great number of Europeans who have come to settle in the city of late years, is the chief cause of this improvement. The work before us states that the foreigners who had fixed themselves in and around Buenos Ayres, in the year 1832, amounted to no less than from 15,000 to 20,000 persons, and of these two-thirds were British and French. The natives, nevertheless, still cling with obstinacy to many of their old prejudices and customs. Sir Woodbine found them bitterly opposed to chimneys when he went there first; they preferred their old braziers or warming-pan sort of utensils, in spite of perpetual risk of suffocation by charcoal, and in spite, also, of perpetual warnings of such a danger. But these and other similar prepossessions had greatly disappeared before our author's departure. Other regular and fixed annoyances, however, will not so readily disappear from Buenos Ayres, depending, as they do, upon the site and climate of the place. Whether Shakespeare had any definite meaning in making Hamlet say, "I am but mad north-north-west: when the wind is southerly, I know a hawk from a heronshaw," we shall not take upon us to say; but circumstances related by Sir Woodbine respecting Buenos Ayres show that in some situations the north-north-west and south may be respectively mad and sane winds. On the north-north-west of Buenos Ayres lies the marshy province of Entre Rios, and a wind coming over that province upon the city produces strange effects. "The irritability and ill humours it excites in some people (says our author) amount to little less than a temporary derangement of their moral faculties. It is a common thing to see men among the better classes shut themselves up in their houses during its continuation, and lay aside all business till it has passed; while, among the lower orders, it is a fact

* Buenos Ayres and the Provinces of La Plata, by Sir Woodbine Parish, K. C. H. 1 vol. John Murray, London.

known to the police that cases of quarrelling and bloodshed are infinitely more frequent during the north wind than any other time. In illustration of this, I shall quote a case in point, the account of which I received from one of the most eminent medical men in the country, who had paid particular attention, during a practice of more than thirty years, to its influence upon the human system." Sir Woodbine then relates an anecdote concerning a man named Garcia, executed for murder. "He was a person of some education, esteemed by those who knew him, and in general rather remarkable than otherwise for the civility and amenity of his manners. His countenance was open and handsome, and his disposition frank and generous; but when the north wind set in, he appeared to lose all command of himself; and such was his extreme irritability, that, during its continuation, he could hardly speak to any one in the street without quarrelling. In a conversation with my informant a few hours before his execution, he admitted that it was the third murder he had been guilty of, besides having been engaged in more than twenty fights with knives, in which he had both given and received many serious wounds; 'but,' he observed, 'it was the north wind,' not he, that shed all this blood." The dying criminal described the wind as exciting in him headache, impatience, and an uncontrollable desire to take umbrage at every person around him, through which latter incitement he had become a shedder of blood. His friends corroborated his statement, and averred that when the wind ceased, "he would deplore his weakness, and never rested until he had sought out and made his peace with those whom he had hurt or offended," if his mad anger had not indeed been fatal to them.

Almost every inhabitant of Buenos Ayres suffers from this northerly wind, though not to such an extent as in the preceding case; and the natives often walk the streets during its prevalence with large split beans stuck upon their temples, as a supposed antidote to the evil effects of the gale on the brain. A south-wester, coming from the parched *pampas* or vast plains on the south-west of Buenos Ayres, cures the disorder, "sweeping away the northern incubus in a few seconds." The south-wester, or *pampero* as it is called, usually comes with extraordinary suddenness and force, and often produces, in consequence, most ludicrous effects. It is customary for the languid population, oppressed by the north wind, to creep down to the river side, and "there they may be seen, hundreds and hundreds of men, women, and children, sitting together up to their necks in the water, just like so many frogs in a marsh. If a pampero breaks, as it often does, unexpectedly upon such an assembly, the scramble and confusion which ensues may be better imagined than told. Fortunate are those who may have taken an attendant to watch their clothes, for, otherwise, long ere they can get out of the river, every article of dress is flying before the gale." At times this gale is attended with less laughable results. "Not infrequently the pampero is accompanied by clouds of dust from the parched *pampas*, so dense as to produce total darkness, in which I have known instances of bathers in the river being drowned ere they could find their way to the shore. I recollect, on one of these occasions, of a gang of twenty convicts, who were working at the time in irons on the beach, making their escape in the dark from their guards, by whom they were never retaken." When a shower occurs during the existence of these dusty gales in the air, the rain is so much blackened as to resemble a fall of ink, or rather liquid blacking.

The *pampas*, which have been incidentally mentioned, merit more particular notice, especially as they have evidently been objects of close attention to Sir Woodbine Parish, whose position as vice-president of the London Geographical Society affords some proof of his qualifications for investigating such subjects. The *pampas* form a vast level space, extending to the shores of La Plata from the eastern terminations of the Andes, and our author conceives that the whole space may once have been a delta, intersected by numerous streams from the Andes, and that these streams carried down alluvial matter in such quantities as to make the whole in time one level tract. Sir Woodbine was fortunate enough to discover the remains of some novel monsters of an extinct breed, buried in these alluvial deposits, on the abundant pastures of which they once doubtless fed and fattened, long ere the earth was given up to man's dominion. Many small and isolated portions of the gigantic sloth, termed the *megatherium* (formerly described in this periodical), were found in the *pampas*, and sent home to England by our author; and he also had the pleasure of procuring one skeleton of the same animal, in a great measure entire. When our readers remember that this creature had a fore-foot fully one yard long, they will better conceive the extraordinary interest attached to a nearly complete megatherial skeleton, no perfect one having been yet found. Sir Woodbine Parish also discovered in the *pampas* several bones, which confirmed the curious fact that these extinct monsters were rendered still more bulky and unwieldy by having large cases of bony armour enclosing their frames. One perfectly new, or at least previously unknown, creature of this order, is described, and a drawing of it given in the work before us. From two Greek words indicative of the *enlarded* or *fatted* form of its teeth, Sir Woodbine has suggested for this extinct animal the name of the *Glyptodon*. The skeleton, which was found nearly

whole in a marsh to the south of Buenos Ayres, measures in length eight and a half feet, and about three feet six inches in height. The drawing in the work gives us an idea of a most extraordinary animal; the whole of the frame, with the exception of the head, the feet, and some of the tail bones of the spine, being concealed by an enormous plate of bone thrown over the body as a horse-cloth is thrown over a horse, and open behind and beneath, where its edges are pendant, and not connected with any thing. This bony case, however, fits closely round the neck. Altogether, the skeleton is of a barrel shape, though, if the outer case were taken off, the appearance would be nearly that of common quadrupedal skeletons, with spinal column, ribs, and leg-bones composing the osseous frame. Buckland and others had determined that the megatherium must have been provided with a bony coat of armour, and the discovery of the glyptodon, a creature, unquestionably, of the megatherial family, affords ample corroboration of the conjecture which these geologists had been induced to form. In the sketch before us, the feet have been added conjecturally, but "the form and structure of the tooth (says our author) indicate its adaptation to masticate vegetable substances of the softer kind; and the animal must have been provided with claws suitable to the digging up of esculent roots, reeds, &c." The discovered glyptodon itself will soon, Sir Woodbine hopes, be in Britain, where it cannot but afford a rich treat to every scientific inquirer. He also hopes that the *pampas* may yet yield many such treasures, and this hope will, we trust, be realised. By the prosecution of studies of this nature, man's intellectual power is more nobly and fully displayed than it could be in any other way. Gradually are we over-leaping through these studies the barrier of ages—penetrating into the mysteries of periods far removed from all human records—and acquiring a complete knowledge of the primordial earth, its aspect, and all that its surface displayed, vegetable or animal, of the "old sea" with its numberless inhabitants, and even of the air with all the "fowls of heaven"—though oblivion may be said to have long cast its veil over all. This is indeed to overcome time, and almost to make ourselves denizens of eternity.

We cannot, perhaps, more satisfactorily show the value of the contents of the present work, than by confining our remaining notices of it to the section on the Trade of the republic of La Plata, or rather of Buenos Ayres, since it is through the capital that the commerce of the country is almost entirely conducted. This is a subject of great interest in these emigrating times, for Buenos Ayres affords an excellent field for the enterprise of Europeans; and it is satisfactory to think, that, while exerting themselves there to the betterment of their own fortunes, they never fail to confer equal good on the place and its native residents. For example—"Amongst other improvements which Buenos Ayres owes to foreigners (says Sir Woodbine Parish), she is indebted to some enterprising Englishmen for the introduction of late years of a new source of wealth, which bids fair to rival in importance the most valuable of her old staple commodities. It is but a few years ago since the wool of the Buenos-Ayorean sheep was hardly worth the expense of cleaning; and as to the meat, I doubt whether the wild dogs would have touched it. It is well known that their carcasses dried in the sun were used for fuel in the brick-kilns. The great pains, however, and exertions of some intelligent foreigners to introduce and cultivate a better breed, has met with a success beyond all expectation, and now promises to be of the greatest importance to the future commercial prospects of the country. The rapid increase in the value of this article of production will be shown by the following comparative account of the quantities which have been imported into Great Britain alone, in the last eight years." In 1830, the amount was 19,444 lbs. weight; in 1833, it had risen to 207,143 lbs.; in 1836, to 1,073,416 lbs.; and in 1837, to 2,207,351 lbs. To make the increase more plainly apparent, it may be stated, that the quantity from 1830 to 1833 (inclusive) was in all 269,190 lbs.; and from 1834 to 1837 (inclusive) 5,343,319 lbs. Besides this wool-exportation to Britain, nearly a million and a half pounds were sent in one year, 1835, to the United States. Two individuals, Mr Sheridan and Mr Harratt, were the main creators of this trade, affording another proof of what the energies of single human beings can compass, when judiciously expended. Here is a traffic founded, which not only has made fortunes fairly to its originators, but which will benefit millions in years to come.

Great Britain supplies, it would appear, the great proportion of the goods imported into Buenos Ayres, since the republic attained its independence. In 1822, the whole imports amounted to 11,267,622 Spanish dollars in value, and of this sum 5,730,952 dollars constituted the proportion of British goods. Of late years, Britain has supplied goods in nearly the same proportional quantities, when compared with the imports from other countries; but the rise of Monte Video on the northern side of the La Plata estuary, has considerably affected the Buenos-Ayorean trade, as regards the supplying of foreign goods to the internal provinces. Sir Woodbine Parish remarks, that "by far the greatest part of the British imports into Buenos Ayres consist of the plain and printed calicoes and cloths, which, as I have just stated, are become of the first necessity to the lower orders in this part of South America; the cheaper we produce them, the more they will take; and thus it is that every improvement

in our machinery at home, which lowers the price of these manufactures, tends to contribute (we hardly perhaps know how much) to the comforts of the poorer classes in these remote countries." There is much truth in this observation, though to "every improvement in our machinery" the writer might have joined "every decrease in the burdens on our manufacturing industry," by which latter cause the same effect, most certainly, would be produced.

In consequence of the Rio de la Plata being no longer the outlet by which Bolivia and others of the numerous provinces once under the Spanish dominion send their precious metals and their general produce to foreign countries, the tabular statements of yearly exports from Buenos Ayres do not present any striking increase of late years. But this is in appearance only. Considering that the port now depends greatly on its own produce, and that of its own internal provinces, the recent improvement has been really extensive. The exports in 1837 amounted in value to 5,637,138 dollars. Ox-hides constitute by far the most important article in the export trade, as will appear from the fact that more than three millions of the sum mentioned was for these hides. The whole history of the ox and horse tribes in South America is curious. They were brought first thither by the Spaniards, but in numbers so scanty, that, after Peru became a Spanish province, 10,000 dollars were offered and refused in that country for a single horse. A pair of swine, at the same time, were sold for 1600 dollars. "Two Portuguese gentlemen, brothers, of the name of Goa, came to Assumption in 1555, having with them a bull and eight cows, the origin of that mighty stock of cattle which now forms the wonder of the provinces of La Plata." From half a dozen horses turned loose on the *Pampas*, came the breed of that animal, now so abundant also. Some of the oxen having escaped into the country, they there multiplied immensely in a few years; and though the Spaniards occasionally hunted them for their hides, the destruction was as nothing to the increase. "Superabundance led to waste to an enormous extent; a guacho would kill an ox for the tongue, or any other part of the animal he might fancy for his dinner, and leave the rest of the carcass to be destroyed by the vultures or by the wild dogs." The government was obliged at last to take strong measures to stop these evils, for the value, actual and prospective, of the hide trade, was obvious. The *pampas* are now laid out in regular divisions or *estancias*, and cattle-proprietors mark their stock in such a way as to know them from others. "Of the hundreds of thousands of cattle now reared in these lands, there is hardly, perhaps, a single animal of a year old, which is not branded with the mark of an owner." In the Buenos Ayres province alone, there are supposed to be from three to four millions of cattle. The number of exported ox-hides amounts to about a million, and would have been much greater of late years, it is probable, had it not been for the occurrence of the severe droughts of 1830, 1831, and 1832. In these years, little less than two millions of cattle perished from want of water, and the country was long white with their bones.

These gleanings show but imperfectly the value of the work which Sir Woodbine Parish has produced on La Plata; but we heartily recommend our readers to judge further for themselves by the perusal of the volume. Several plates accompany the text, and also a map, prepared by Arrowsmith from authorities collected by Sir Woodbine, and comprising a minute view of South America from the tropic of Capricorn to Cape Horn. This map will henceforth, there is little doubt, be a standard guide on this portion of South American geography. It is sold separately.

SAMUEL WINGRAVE, THE TOBACCONIST.

ONE important cause of breach of trust in servants and others is rarely adverted to—want of sufficient vigilance and superintendence in masters. A young person, of unestablished principles, put into a situation of trust, where the conduct of his employer shows plainly that there is scarce a possibility of his being detected if he should make a trespass, is not done justice to; and his error, if he do err, is in large part to be ascribed to his superior. Not that we would have the culprit too easily excused, but that we would have masters do their duty in watchfulness, do we make this remark. The master is bound in duty to exercise a proper degree of care over his concerns, in order that all hope of safe criminality may be forbidden in his subordinates; and if he fails in this duty, we hold that he is himself guilty of a very great offence against society, that of leading its members into temptation, and perilling their best interests, in a business from which he is to be the chief profitter. Some years ago, there occurred a singular case of this nature, which we shall detail, in the hope of impressing the more forcibly the principle here laid down.

Mr Samuel Wingrave was a respectable tobacconist in a large town, the name of which need not be specified. He had advanced to middle life, and had been in business for considerably more than thirty years, when an important incident signalled his career. For the greater period of his shop-keeping life, he had in his employment but one person, who had grown as necessary to him as his daily food, and who was, in fact, the chief manager of the business. Mr Wingrave himself was decidedly an industrious man, but, from constitutional indolence, and early defects of training,

he was incapable of conducting his affairs in that systematic way which is almost indispensable to success. All the system which the tobaccoist's establishment displayed was ascribable to the trusty shopman, Richard, or Dick Jackson, as his master styled him, though Dick was scarcely a younger man than his superior.

"Dick," said Mr Wingrave one day to his shopman, in the confidential way in which he was always wont to treat the latter, "Dick, I am growing old, and I begin to have uneasy thoughts that didn't use to trouble me before. What is the reason, think you, that I have never been able to lay up money like my neighbours?" Mr Jackson appeared posed by this question, but, after a pause, he replied, "You have brought up a pretty large family." "True," said the tobaccoist, "but so have some of my neighbours, who have not appeared to do more business than I, and yet they have laid up money, although living more expensively than I have ever done. Ah, Dick, I have been too indolent and heedless—that, I suppose, is the true state of the case. And now I am getting old, without having made a purse for any of my boys and girls." So ended this conversation, but the feeling expressed was not so easily removed from Mr Wingrave's mind.

Mr Wingrave and his shopman Jackson had long managed the business alone, and, of course, during the master's necessary terms of absence, the other had been left by himself in the shop. But on attaining a fit age, the tobaccoist's eldest boy was taken in as a sharer in the toils of tobacco-selling, and by this means the shop was seldom left to the sole management of either master or man. The boy in question, as it chanced, was intelligent, active, and quick-eyed, and shortly after the occurrence of the brief dialogue just recorded, he noticed an incident which forcibly struck and surprised his youthful perceptions. Having received a crown piece of a new coinage, or at least fresh from the mint, he examined it attentively ere he deposited it in the till. On returning soon after from some call of duty, he again felt a desire to look at the glittering piece, and sought it for this purpose. To his great surprise, it was not to be seen. Being certain that no one had been in the shop in the interval, excepting Jackson, the boy naturally inquired of him "if he had seen the pretty crown piece they got a little ago." The old shopman replied in the negative, and remarked that it would probably have been given away in change. But the youth was almost confident that such could not have been the case. He was, as has been said, quick-eyed for his years, and the conclusion which he could not but form was, that Jackson alone could have touched the missing coin, after it was laid in the drawer.

Young Wingrave did as very few boys of fourteen would have done under the circumstances. Assured that a boy's observation would never have been put in the balance against Jackson's long-sustained credit, he did not inform his father of the crown piece incident, but set himself assiduously to the task of discovering whether such disappearances of silver were of common occurrence. He secretly marked different coins in such a way as to be readily distinguishable again by himself, though not by others, and watched their fate after their consignment to the till. It was long ere the boy attained to a satisfactory result, and it was amazing how much perseverance and secretiveness he displayed in pursuing his object. But, in the end, without having yet communicated with a human being on the point, he became perfectly assured that Jackson was in the regular habit of abstracting money from the drawer in small quantities at a time!

Knowing that Jackson had no claim or authority to do this, being paid a quarterly salary, the boy refrained no longer from informing his father of what he had observed. At first the old tobaccoist laughed outright at the intelligence, and declared the whole to be an absurdity. "What! Dick Jackson steal, and steal from me! Impossible!" But the persevering assertions of the boy, and his distinct account of the close watchings which had led him to the conclusion, staggered the tobaccoist's faith at last, although absolute conviction might not be produced. The son proposed secretly and cautiously to repeat his coin-markings with the father's cognisance, and to this course of proceeding the latter agreed. The issue was, that Mr Wingrave was brought in a week or two to the clear and firm assurance that the man whom he had so long trusted was in the regular practice of pilfering from the contents of the till. This conviction caused much pain to Mr Wingrave, and it also excited much doubt and conjecture as to the past; seeing that no one could determine at what time the system of peculation had begun, and to what extent it had proceeded. One thing was obvious, that Jackson's course required to be brought to a close.

Being a man of little penetration or activity of mind, it was perhaps well for the tobaccoist that he thought of consulting an intimate friend and relative, a person "learned in the law," and still more deeply versed in the learning of common sense, upon the subject of Jackson's delinquencies. By this friend's advice the matter was kept secret, and Jackson was privately sent for to the presence of the only three parties acquainted with the discovery, namely, Wingrave, his son, and the lawyer. It would have been hard for any spectator of this interview to say whether the tobaccoist or his faithless servant exhibited most distress in entering on the subject of the meeting. Suffice it to say, that Jackson at the outset denied his guilt, though with a guilty

bearing and countenance. But when Wingrave and the boy went over the proofs of his crime which they had severally and conjunctly collected, and the lawyer at the same time declared that they would be recognised as full and decisive criminatory evidence by the law, the treacherous shopman fell upon his knees in an agony of fear, and prayed in the most abject manner for mercy. This, of course, the tobaccoist would not consent to, without a full confession of the length of time he had carried on his peculations, and the extent, if it could be told, to which they had gone. In the terrors of the moment, Jackson confessed all. His thefts had begun almost with his entrance to Wingrave's service, and had since continued without intermission, the wretched old man declaring that in the end he had lost all sense of guilt, and had come to regard whatever he took as fairly his own. "But let me go home," exclaimed he, "and for pardon and concealment I will give up all I possess in the world." The simple tobaccoist would at once have consented to this, but the lawyer, who knew human nature better, and put little confidence in compulsory repentance, required Jackson to give up the keys of his repositories, and to inform them where his money was placed. The hesitation with which the criminal complied with this demand, though it might partly arise from the involuntary strugglings of that avarice by which he had been drawn into guilt, justified the lawyer's caution. The shopman, however, gave up his keys, and stated that the fruits of his thefts would be found in one escritoire, in the shape of bank receipts. Having received proper authority from its miserable proprietor, the lawyer then sent to Jackson's lodgings for the escritoire in question.

When this article was brought, it was found to contain a number of receipts from different banks, among which, to avoid suspicion, Jackson had distributed his stolen funds. On seeing the very large amount of the sums for which these papers were the vouchers, the tobaccoist experienced mingled feelings. He was shocked to think that he had been so long at the mercy of a man who was capable of robberies to such an extent, and he could not but feel pleasure at the thought that these large sums were undeniably his own. Jackson sat with his self-dishonoured grey head bent to the ground, while his secret repository was undergoing examination. A question from his master made him raise his eyes and speak. "All is there," said he huskily, "and more than all. My own small savings are in these bills also. I have enjoyed nothing, either from my own means, or—your, but the pleasure of hoarding." The melancholy or rather despairing tone in which these words were uttered, softened the heart of the simple tobaccoist; and had he not been restrained by the presence of others, he would have done and said more at the moment than prudence or a just liberality could have sanctioned.

We are not aware that Mr Wingrave reflected as he ought to have done on his own share of blame; but he was so far just towards one whom we cannot but look on as in some measure the victim of his carelessness, that he returned to Jackson his own savings, amounting to a sum by no means inconsiderable, and allowed him to withdraw from the country. He did not for many years disclose the circumstances; but not having heard what became of the culprit afterwards, we cannot say whether this tenderness was of any service to him. The sum recovered by Wingrave, amounting to several thousand pounds, became a fair endowment to his family at his death.

A WHALE-CHASE.

On the 25th of June 1812, one of the harpooners belonging to the *Resolution*, of Whitby, under my command, struck a whale by the edge of a small floe of ice. Assistance being promptly afforded, a second boat's lines were attached to those of the first-boat, in a few minutes after the harpoon was discharged. The remainder of the boats proceeded at some distance, in the direction the fish seemed to have taken. In about a quarter of an hour, the first-boat, to my surprise, again made a signal for lines. As the ship was then within five minutes' sail, we instantly steered towards the boat, with the view of affording assistance, by means of a spare boat we still retained on board. Before we reached the place, however, we observed four oars displayed in signal order, which, by their number, indicated a most urgent necessity for assistance. Two or three men were at the same time seen seated close by the stern, which was considerably elevated, for the purpose of keeping it down, while the bow of the boat, by the force of the line, was drawn down to the level of the sea, and the harpooner, by the friction of the line round the bollard, was enveloped in smoky obscurity. At length, when the ship was scarcely a hundred yards distant, we perceived preparations for quitting the boat. The sailors' pea-jackets were cast upon the adjoining ice; the oars were thrown down; the crew leaped overboard; the bow of the boat was buried in the water; the stern rose perpendicular, and then majestically disappeared. The harpooner having caused the end of the line to be fastened to the iron ring at the boat's stern, was the means of its loss; and a

* "Giving a whale the boat" as the voluntary sacrifice of a boat is termed, is a scheme not unfrequently practised by the fisher when in want of line. By submitting to this risk, he expects to gain the fish, and still has the chance of recovering his boat and its materials. It is only practised in open ice or at fields.

tongue of the ice, on which was a depth of several feet of water, kept the boat, by the pressure of the line against it, at such a considerable distance as prevented the crew from leaping upon the floe. Some of them were, therefore, put to the necessity of swimming for their preservation; but all of them succeeded in scrambling upon the ice, and were taken on board of the ship in a few minutes afterwards.

I may here observe, that it is an uncommon circumstance for a fish to require more than two boats' lines in such a situation; none of our harpooners, therefore, had any scruple in leaving the fast-boat, never suspecting, after it had received the assistance of one boat with six lines or upwards, that it would need any more.

Several ships being about us, there was a possibility that some person might attack and make a prize of the whale, when it had so far escaped us that we no longer retained any hold of it; we therefore set all the sail the ship could safely sustain, and worked through several narrow and intricate channels in the ice, in the direction I observed the fish had retreated. After a little time, it was descried by the people in the boats, at a considerable distance to the eastward: a general chase immediately commenced, and within the space of an hour three harpoons were struck. We now imagined the fish was secure, but our expectations were premature. The whale resolutely pushed beneath a large floe that had been recently broken to pieces by the swell, and soon drew all the lines out of the second fast-boat; the officer of which, not being able to get any assistance, tied the end of his line to a hummock of ice and broke it. Soon afterwards, the other two boats, still fast, were dragged against the broken floe, when one of the harpoons drew out. The lines of only one boat, therefore, remained fast to the fish, and this, with six or eight lines out, was dragged forward into the shattered floe with astonishing force. Pieces of ice, each of which was sufficiently large to have answered the purpose of a mooring for a ship, were wheeled about by the strength of the whale; and such was the tension and elasticity of the line, that whenever it slipped clear of any mass of ice, after turning it round, into the space between any two adjoining pieces, the boat and its crew flew forward through the crack, with the velocity of an arrow, and never failed to launch several feet upon the first mass of ice that it encountered.

While we scoured the sea around the broken floe with the ship, and while the ice was attempted in vain by the boats, the whale continued to press forward in an easterly direction towards the sea. At length, when fourteen lines (about 1680 fathoms) were drawn from the fourth fast-boat, a slight entanglement of the line broke it at the stem. The fish then again made its escape, taking along with it a boat and twenty-eight lines. The united length of the lines was 6720 yards, or upwards of three and a half English miles; value, with the boat, above £150 sterling.

The obstruction of the sunken boat to the progress of the fish must have been immense; and that of the lines likewise considerable, the weight of lines alone being thirty-five hundred weight.

So long as the fourth fast-boat, through the medium of its lines, retained its hold of the fish, we searched the adjoining sea with the ship in vain; but in a short time after the line was divided, we got sight of the object of pursuit, at the distance of near two miles to the eastward of the ice and boats, in the open sea. One boat only with lines, and two empty boats, were reserved by the ship. Having, however, fortunately, fine weather, and a fresh breeze of wind, we immediately gave chase under all sail; though it must be confessed, with the insignificant force by us, the distance of the fish, and the rapidity of its flight considered, we had but very small hopes of success. At length, after pursuing it five or six miles, being at least nine miles from the place where it was struck, we came up with it, and it seemed inclined to rest after its extraordinary exertions. The two dismantled or empty boats having been furnished with two lines each (a very inadequate supply), they, together with the one in a good state of equipment, now made an attack upon the whale. One of the harpooners made a blunder; the first saw the boat, took the alarm, and again fled. I now supposed it would be seen no more; nevertheless, we chased nearly a mile in the direction I imagined it had taken, and placed the boats, to the best of my judgment, in the most advantageous situations. In this case we were extremely fortunate. The fish rose near one of the boats, and was immediately harpooned. In a few minutes two more harpoons entered its back, and lances were plied against it with vigour and success. Exhausted by its amazing exertions to escape, it yielded itself at length to its fate, received the piercing wounds of the lances without resistance, and finally died without a struggle. Thus terminated with success an attack upon a whale, which exhibited the most uncommon determination to escape from its pursuers, seconded by the most amazing strength, of any individual whose capture I ever witnessed. After all, it may seem surprising that it was not a particularly large individual; the largest lamina of whalebone only measuring nine feet six inches, while those affording twelve feet bone are not uncommon.† The quantity of line withdrawn from the different boats engaged in the capture was singularly great. It amounted, altogether, to 10,440 yards, or nearly six

† It has been frequently observed, that whales of this size are the most active of the species; and that those of very large growth are in general captured with less trouble.

English miles. Of these, thirteen new lines were lost, together with the sunken boat; the harpoon connecting them to the fish having dropped out before the whale was killed.—*Captain Scoresby's Voyage.*

THE HISTORY OF AN AULD NAIG.

AMONGST a few papers contributed some years ago to a London annual by the Ettrick Shepherd, and which (no opportunity having occurred for using them) have been transferred to us, is one under the above title. The author mentions that, being at a Scottish rural fair, held near the Roxburghshire village of St Boswell's, he was greatly amused by a specimen of low bargain-making which he saw going on in a tent, with respect to an old hard-featured nag (in Scottish phrase *naig*), which was standing whisking his tail on the village street. "His owner, the very prince and hero of all vulgarity, was sitting," says the writer, "on a form, holding by the halter, guzzling ale, and taking at least a quarter of a pound of bread at every bite. He was trying to sell the veteran steed to four others of the same class, who were manifestly intending to overreach him, yet at the same time they could not help regarding him as a sort of natural curiosity. Such a group, taking in the horse and all, I never beheld! The following is a literal specimen of a part of their dialogue:—

'Come noo, maister, let us hear what ye're gaun to say about the naig! Are ye gaun to tak' the thretty shillings for him or no?'

'Thretty shillings, mun!—thretty pipe-stapples! Aw wadna tak' your twa-pund-ten for him; as sure as death, aw wudna. He's a horse that, mun, that'll gang up hill an' down hill, through fire an' water, yird an' stane, an' never an ill word in his head—it's as sure as death, mun. He's a horse that'll never stand still wharever he gangs to. Thretty shillings! Aw wudna luk on the side o' the gate ye're on, mun, wi' your thretty shillings.'

'The only thing aum feared for,' said one of the proposing purchasers, 'is, that we'll no get him home for dogs' meat. Whar did ye pick him up, for aum sure ye canna ha'e brought him far?'

'Aw think nae shame to tell whar aw gat him, mun! Aum nane o' that sort!—ay, nor what aw ga'e for him neither. Aw coft him on the tap o' the street in the Gersemerkat o' Edinbrough, frae auld Peter Dods, the coal-cawer, a gayan quirky carle. Aw thought the horse liftit his feet gayan weel, for aum never at a loss to see what's what; and sae aw says, "Peter, whar are ye axin' for the auld beast?" "Thretty shillings," says he. "Thretty puffs o' tobacco reek, mun!" says I. "Ye maunna speak that gate till me, wha kens better. But come awa into Newbigging's, an' we'll ha'e a bottle o' yill. It'll no brik us baith." As sure as death, aw said sae. "It'll no brik us baith, Peter," says I. "Weel, we gets the yill. "An' now, Peter," says I, "aum nane o' the kind o' folks wha mak' a great whittly-whattying an' arglebargaining about a thing, however big the soom. Aum just gaun to lay ye down five-an'-twenty shillings for the naig, tak' it or want it."

'Five-an'-twenty puffs o' tobacco reek!' quo' the auld mockrife carle. "Ye maunna speak that gate till me, lad, wha kens better. But aw'll tell ye what aw'll do wi' ye; aw'll just tak' it." An' wi' that he nippit up my five-an'-twenty shillings, an' pat it in his pouch wi' a girm. "An' now, lad," says he, "the siller's mine, an' the beast's yours, an' ye're very welcome to him."

Od, sir, aw thought aw was fairly snappit, an' the very countenance o' me rase as it had been set in a lowe. "If ye hae chestit me wi' that beast, billy," says I, "aw'll scorn to loup back or gang to the law wi' ye, however great may be my loss. But aw promise ye a good threshin', an' I'll keep my word too. Only tell me this: is the beast no a good beast?'

"Gin he be a good beast, ye'll be the better o' him," says he, an' aff he gangs laughin', and turnin' the quid in his cheek.

Aw was verra sair dung down; but what could aw do? My siller was gane; sae aw took my beast, an' pat him into the Meadow Park. Aw coudna sleep a wink that night wi' thinking about my bargain. "Aum sair, sair taken in," thinks I; "for if the beast be useless, there aw hae to pay auld Gray aughteenpence a-night for his gerse, an' that's mair nor aw can gain through the day; an' the best thing aw can do is to gie him again to auld Peter for naething. It's as sure as death." Weel, as soon as it was daylight, aw sets wi' a heavy heart to look after my beast, an' soon fand him feedin' close to the hedge; sae aw lays ma lugs i' ma neck to listen, an' there is he ruggin' an' rivin' an' craunchin' away at nae allowance. "There is some hope here yet," thinks I; "for gin a beast dinna eat weel, it'll never work weel," an' wi' that aw gie's my apron a blatter at him; an' aw'll be the greatest lecar ever was born if he didna spang up i' the air like a wild deer, till aw thought he was gaun to loup ower the chimla taps—as sure as death aw did. An' then he cockit up his head an' his tail till the twasome met thegither, an' he ga'e three skeerds o' snorts till a' the Hope-park-end yelled again. "There he goes that never saw the morn!" cries I. There's mair mettle

there by a hunder times than any body wad think! An' aw'll tell ye what it is, ma jolly auld rogue: aw'll no tak any man's twa-pund-ten for ye, gin he war to lay it down this day! As sure as death, aw say sae. An' that's how aw cam by the auld naig.'

CHIDHER.

[FROM FREDERICK RUCKERT.]*

Spoke Chidher the immortal, the ever young;
I passed by a city, a man stood near,
Plucking fruit that in a fair garden hung;
I asked, How long has the city been here?
He said, as the clustering fruit he caught,
There was always a city on this spot,
And so there will be, till Time is not.

Five hundred years rolled by, before
I was standing upon that spot once more.

Not a trace of the city could be seen;
A shepherd lay piping his song alone,
His flocks were browsing the herbage green;
I asked, How long has the city been gone?

He said, while still on his pipe he played—
Fresh flowers spring up, as the others fade,
Here I and my flocks have ever strayed.

Five hundred years rolled by, as before:—
I was standing upon that spot once more.

I found there a sea, with billows crested;
A man was shooting his fishing gear,
And, as from the heavy draught he rested,
I asked, How long has the sea been here?

He smiled at my question, and thus he spoke:
As long as these waves in foam have broke,
It has been the haunt of us fisher folk.

Five hundred years rolled by, as before:—
I was standing upon that spot once more.

A tall spreading forest there I found,
And a woodman old in its shadows drear;
The strokes of his axe broke the silence round:
I asked, How old is the forest here?

He said, All the days of my life I've known
This forest a forest, and dwelt alone
'Mong trees, that ever were growing or grown.

Five hundred years rolled by, as before:—
I was standing upon that spot once more.

'Twas a city now, where the hum resounded
Of crowds on a festive holiday:
I asked, What time was the city founded?

The forest, and sea, and pipe, where are they?
They cried, of my question taking no thought,
'Twas always the same as now—this spot,
And so it will be, till time is not.

And when five hundred years have rolled by, as before,
I'll be standing upon that spot once more.

* The translator informs us that this piece has already appeared in a newspaper.

THE TREAD-MILL.

A prisoner may be a tailor, a watch-maker, a book-binder, a printer, totally unaccustomed to any such species of labour. Such a man may be cast into jail at the end of August, and not tried till the March following: is it no punishment to such a man to walk up hill like a turnspit dog, in an infamous machine, for six months? and yet there are gentlemen who suppose that the common people do not consider this as punishment!—that the gayest and most joyous of human beings is a trader, untried by a jury of his countrymen, in the fifth month of lifting up the leg, and striving against the law of gravity, supported by the glorious information which he receives from the turnkey, that he has all the time been grinding flour on the other side of the wall. * * The labour of the tread-mill is irksome, dull, monotonous, and disgusting to the last degree. A man does not see his work, does not know what he is doing, what progress he is making; there is no room for art, contrivance, ingenuity, and superior skill—all which are the cheering circumstances of human labour. The husbandman sees the field gradually subdued by the plough; the smith beats the rude mass of iron by degrees into its meditated shape, and gives it its meditated utility; the tailor accommodates his parallelogram of cloth to the lumps and bumps of the human body, and, holding it up, exclaims, "This will contain the lower moiety of a human being." But the treader does nothing but tread: he sees no change of objects, admires no new relation of parts, imparts no new qualities to matter, and gives to it no new arrangements and positions; or if he does, he sees and knows it not, but is turned at once from a rational being, by a justice of peace, into a *primum mobile*, and put upon a level with a rush of water or a puff of steam. It is impossible to get gentlemen to attend to the distinction between raw and roasted prisoners, without which all discussion on prisoners is perfectly ridiculous. Nothing can be more excellent than this kind of labour for persons to whom you mean to make labour as irksome as possible; but for this very reason, it is the labour to which an untried prisoner ought not to be put. * * It is very untruly stated, that a prisoner, before trial, not compelled to work, and kept upon a plain diet, merely sufficient to maintain him in health, is better off than he was previous to his accusation; and it is asked, with a triumphant leer, whether the situation of any man ought to be improved, merely because he has become an object of suspicion to his fellow-creatures? This happy and unfortunate man, however, is separated from his wife and family; his liberty is taken away; he is confined within four walls; he has the reflection that his family are existing upon a precarious parish support, that his little trade and property are wasting, that his character is become infamous, that he has incurred ruin by the malice of others, or by his own crimes, that in a few weeks he is to forfeit his life, or be banished from every thing he loves upon earth. This is the improved situation, and the redundant happiness, which requires the penal cir-

cumvolutions of the justice's mill to cut off so unjust a balance of gratification, and bring him a little nearer to what he was before imprisonment and accusation. But a man who is about to be tried for his life, often wants all his leisure time to reflect upon his defence. The exertions of every man within the walls of a prison are necessarily crippled and impaired. What can a prisoner answer who is taken hot and reeking from the tread-mill, and asked what he has to say in his defence? This is a very strong feature of cruelty and tyranny in the mill. We ought to be sure that every man has had the fullest leisure to prepare for his defence, that his mind and body have not been harassed by vexatious and compulsory employment. The public purchase, at a great price, legal accuracy, and legal talent, to accuse a man who has not, perhaps, one shilling to spend upon his defence. It is atrocious cruelty not to leave him full leisure to write his scarcely legible letters to his witnesses, and to use all the melancholy and feeble means which suspected poverty can employ for its defence against the long and heavy arm of power.—*Works of the Rev. Sydney Smith.*

CLOTH-MAKING WITHOUT SPINNING OR WEAVING.

Among the many extraordinary and truly wonderful inventions of the present times, is a machine for the making of broad or narrow woollen cloths without spinning or weaving, and, from our acquaintance with the staple manufacture of this district, after an inspection of patterns of this cloth, we should say there is every probability of this fabric superseding the usual mode of making cloth by spinning and weaving. The machines are patented in this and every other manufacturing nation. The inventor is an American, and appears to have a certain prospect of realising an ample fortune by the sale of his patent right. We understand patterns of this cloth, as well as a drawing of the machinery, have been shown to many of our principal merchants and manufacturers, none of whom have expressed a doubt but that the machinery appears capable of making low cloths which require a good substance. Should it succeed to any thing near the expectation of the patentee, its abridgement of labour, as well manual as by machinery, will be very great. We find that means are already taken to introduce this machine among our continental rivals; a company of eleven gentlemen in London have deposited five thousand pounds with the patentees, who have ordered a machine for them; when finished, they are to try it for one month, and if at the end of that time they think it will succeed, they are to pay twenty thousand pounds for the patent right in the kingdom of Belgium, and it will of course be worked there. We are therefore bound in duty to our country, and her manufacturing interests, to adopt such facilities as will prevent us falling into a position below our rivals in other countries. We are informed the necessary machinery for the production of this patent woollen felted cloth will be tried here in a week or two, under the superintendence of the inventor, by a cloth merchant who has an exclusive licence, but is about to associate with him twenty other respectable business men, for the purpose of sharing the expenses of giving the invention a fair trial. It is calculated that one set of machinery, not costing more than six hundred pounds, will be capable of producing six hundred yards of woollen cloth, thirty-six inches in width, per day of twelve hours.—*Leeds Mercury.*

INFLUENCE OF CHILDREN.

I cannot but think that this constant presence of human nature, pure and happy, of simple and innocent enjoyment, exerts a great though little-noticed influence on this whole great fighting family of man; and that each member of it forgoes somewhat of his selfishness, abates something of its fury, after every such contemplation of something happier than himself, which never yet regarded *self*, never was infuriated by passions. No wonder that the greatest of men have mostly evinced a passionate fondness for children; neither is it surprising that in some persons, not otherwise of weak character, such fondness should even rise to excess. In our mourning over a lost child, the very sources of our comfort bear in them an embittering venom for our grief. The same purity of soul which assures us of its acceptance into the bosom of God, also renders the memory of its vanished prettiness and graces more intolerable by the exemption of every, even the least, drawback on our love, from failings or offence. To the busy world, what indeed is the death of a child? It forwarded, it retarded no human aim; it stood an insignificant little alien by the side of the mighty and dusty arena of life. Not so to the parent. To him its smile and play were the invigorating spirit that nerved him in the conflict; and the very apathy of the whole world besides, its utter want of sympathy with him in (to their feeling) trifling loss, becomes itself an added source of poignant, lonely, heart-consuming misery.—*Beutley's Miscellany.*

PERVADINGNESS OF POETRY.

Life is full of poetry; throughout all its affections, its distant points of similitude and agreement, its picturesque aspects, its mental associations, and that inner world of unspoken hopes, frustrated aspirations, unrequited tenderness, blighted or unrewarded love, griefs, regrets, propensities, fancies, which are perpetually in action beneath the surface, welling up like springs in the centre of the earth, hidden but restless, supplying a principle of life which at once stimulates and assists its energies. Who has not felt some of these struggles and fictions of the heart and the imagination? Who has not been conscious of the exaggerations of passion, the delusions, disappointment, and chaos of volition without power, of whole dramas of sentiment begun and ended like a reverie in the chambers of the brain? Depend upon it, every man living is capable of poetry, and, which is something more to the purpose, cannot help himself. He cannot, if he would, extricate himself from his enchantments. The spell is in the air, and he breathes it from morning till night.—*Monthly Chronicle.*

ODD WAYS OF MAKING A LIVING.

It is a poor country village which cannot support an entire baker, or shoemaker, or tailor; but no country village will support an integer human being in the business of furnishing meat for cats and dogs, or maintain a whole beggar upon a crossing. In the country, only the right-down, old-established, universally recognised trades are practised. If we be on the outlook for odd ones, we must go to some seat of vast population, where not only have men more wants, but a sufficient number exist, by clubbing minute and rarely occurring needs, to furnish occupation for persons who in small towns could only exist in fractions or not at all. For example, a heraldry painter could only exist in a large town. Nottingham would not perhaps require above one-fifteenth of a professor of that art, and Exeter possibly a tenth. Dundee, though more populous, being also more mercantile, would probably rest satisfied with a fiftieth or a sixtieth. Edinburgh, being an aristocratic town, takes a whole one. Local circumstances, also, give rise in great cities to extraordinary modes of making a livelihood.

During the stock-jobbing mania which reigned in Paris under the auspices of Mr Law, the Rue Quinquempoix was the grand scene of operations. By law the business was confined to that spot, which was accordingly crowded daily with people of all ranks and conditions, eagerly engaged in bargaining for slips of paper representing nothing. Desks and writing materials were in great request, but in so crowded a space it was not easy to obtain them. In this exigency, a hump-backed man let out his deformity for the adventurers to scribble upon; and so useful did he thus become, or so lavish were his customers, that he is said to have made a hundred and fifty thousand livres in a few days. Here, circumstances, local and moral, such as could only exist in a large city, gave occasion for what must certainly be esteemed a singular mode of gaining a living. It was also, however, ingenious in the little man to think of it. Many men equally crooked, but less clever, would have seen the tide of fortune running through the Rue Quinquempoix for ever, without taking such an advantage of it. He deserved his hundred and fifty thousand livres, if only for his sagacity and willingness to turn himself to account.

The nearest thing to the case of the hunchback is that of the individuals who agree to perambulate the streets of London, enclosed between two boards, each containing advertisements. It is only about five-and-twenty years, if we are not greatly mistaken, since this fashion began, its cause being the extreme difficulty experienced in the metropolis, of getting the public made acquainted with the qualities and cheapness of certain wares, the hopefulness of new lottery schemes, the virtues of certain medicines, and other matters greatly for their advantage, if they would only open their eyes and think so. The spectacle of a man consenting to be labelled for the good of his country, was such a new feature in the moral world, as could not fail to draw great attention. Every body gazed with wonder and respect on the boarded hero, as he walked gravely and solemnly along the street, saying nothing, and yet so eloquent all over—

"One would have almost said his body thought—"

looking as if he were quite unconscious of any thing particular, and yet practising a silent ventriloquism all the time—readable also in the rear, like a book telling a great deal in the back-title—and taking care every now and then to turn and walk in a different direction, so that he might be perused on both sides. A few might smile; but he was armed in proof against railery, and, like an ancient knight in the tilt-yard, might have even been thrown down and trodden upon without suffering much inconvenience. The wits let fly many shafts at him. He was likened to the mantis or walking leaf, and people talked of his back as his

second page. He was said to be a new kind of herald, who had dismissed the trumpet and voice, and resolved to give his proclamations on the tabard. When his placards were changed, he was said to have been put to press and brought out in a new edition. A typographical error being pointed out in him, he was said to be, what few men liked to consider themselves, liable to correction. Another wag instituted a comparison between his trade and that of certain journalists residing in the neighbourhood of his principal walk. Our walking placard, said he, lets out his body at so much a-day, for the purpose of asserting a few highly questionable facts about genuine tea, matchless cigars, and what not. In like manner, the journalist of the kind hinted at, lets out his brain to detail, daily or weekly, all the dubious facts and malicious party slanders and sarcasms which it may please his employers to circulate. Our testudinous friend, though, as he walks the Strand, he may feel a little advertizingly, yet regards himself as a mere mechanical medium for the representation of certain statements, the truth or falsity of which is only known to others. So does our journalising friend consider himself as a mere intellectual medium for the setting forth of allegations, which may be true or false for any thing he knows. Thus, also, the gentleman loricated in advertisements has no predilections as to the things he advertises, walking with equal satisfaction under the vegetable medicines which are sure to destroy his fellow-creatures, and the cheap gentlemen's apparel, which not improbably is worth all it costs. So is the other gentleman quite as ready to give proper literary shape to the calumnies of one party as to the calumnies of another. In the one case, it is a back and front which does the work; in the other, it is a brain. There is positively no difference in the two trades—excepting perhaps that the gentleman mailed in boards and posted with placards is probably able to set up his face a great deal more confidently for what he is about, than would be the gentleman of the Mail or Post, or whatever other name he may delight in.

One of the most odd of all the out-of-the-way modes of gaining a living in our metropolis, is that practised by gentlemen who haunt the wine-vaults at the docks. They are understood to inherit from nature an unusually delicate palate, which, with great experience in the characters of various wines, is supposed to qualify them to an unusual degree for making selections of those liquors for intending purchasers. Their living is literally from hand to mouth. They are fed by both dealers and private gentlemen to accompany them into the vaults, and give their judgment respecting the wines submitted to them. If they were to swallow any considerable part of what they taste, they would soon lose the power of judging, or doing any thing else. They are scrupulous to discharge from their mouths whatever they take as a tasting; and yet, it is said, this cannot be done so effectually, but that, in the course of time, their health is affected by their course of life, and they break down at a comparatively early age. The sensations which they experience in the line of their duties, are of a very exquisite nature, and these they describe in a language quite their own—full of fine analogies. One engaged as a witness at a trial, where a cargo of wine was the matter in dispute, avowed his certainty that the wine which was sent was different from the sample, as was contended by the plaintiff. "And how do you know that?" inquired the opposite counsel. "Oh, it is quite a different wine to my taste. There was a fine *farwell* flavour about the sample, which the wine sent totally wants." A book on his trade by one of these gentlemen would be a pneumatological curiosity. Why, in this age of practical literature, does not some one bring out a little gilt-edged tome, entitled "A Gentleman's Adventures in search of a Pipe of Wine?"

Some years ago, in one of the large towns of the West of England (perhaps similar cases are not un-

known elsewhere), a man became notorious for a very peculiar kind of business. He was, ostensibly at least, a builder, a sullen misanthropic wretch, without domestic ties of any kind, and apparently bent on gold only for its own sake, as he lived in the style of a miser. This man was constantly prowling about the outskirts of the town, marking the progress of building operations, and acquainting himself with circumstances relative to property in land and houses. When a new factory was about to be set up, he would, if possible, purchase some bit of ground near by, the possession of which he calculated must be sooner or later necessary to the comfort of the parties concerned, and which of course he would only sell at an enormous price. When he saw a gentleman getting a handsome house built, he was sure, if at all possible, to buy a rood of land opposite to it, and there deliberately begin to erect an anomalous little edifice, curiously composed of shingle and brick, with chimneys perking up like the ears of a donkey, and the whole approximating in character to a dog-kennel, if approximating to any thing known upon earth. Imagine the alarm of a jolly manufacturer at seeing his vision of a fairy palace thus blasted by a cunning old villain, equally inaccessible to soft entreaty and stormy menace—one who would go on with the construction of his wretched hovel, with as much apparent interest in its architecture and purpose as could be manifested by the gentleman himself respecting his elegant mansion—cool, steady, determined to persevere while it suited his pleasure and convenience to do so—not to be driven from his point either by cries of "shame!" from the passing populace, or the infuriated face of the impending tyrant looking poisoned arrows from the unfinished drawing-room windows on the other side of the way—in short, quite a suburban Hampden, determined to defend his dog-kennel to the last extremity. The victim, after a fortnight's writhing, would propose to purchase the rood with the building in the course of being erected upon it, when, as might be expected, an exorbitant price would be asked. He would retire, determined not to purchase. He would for a little time stop the building of his house, and deliberate if it were not better to plant it somewhere else, even at a great loss, than to give in to the old fellow. During this interval, the dog-kennel would also make a pause, as if out of respect. Then the gentleman would take heart again, and go on, when instantly the building of the eyesore would also proceed. The unfortunate man would turn over a thousand schemes—he would think of building a high wall in front of his house to shut out the view—he would change his plan, and make the drawing-room look in another direction; but all would be in vain. Like a fatigued salmon landed after all its struggles by the inexorable angler, he would be obliged to come in at last, and buy up the property of his annoyer at the price of some goodly field. But one small joy was his, to set off against the anguish he had endured for months—and that was felt, when, the bargain being completed, he could rush across the way, hatchet in hand, and hack and hew away at the dog-kennel, till his sinews were tired, or his long-suspended Destructiveness had gratified itself to the utmost.

This old wretch went on building temples to the Genius of Annoyance for several years, and so well did he calculate in most cases, that in time he became extremely rich. He acquired the name of Eyesore Jack, and was the subject of a curious interest to those who recognised his mean, insidious-looking person on the street. It was strange, certainly, to reflect on one who appeared to have no aim in life but to give discomfort to his fellow-creatures, and seek for a wretched aliment in their groans. But the old remark about the pitcher held good in his case, as it does in so many others. A couple of enterprising builders had reared a row of neat houses in a genteel part of the suburbs, and were beginning to get them sold to considerable

EDINBURGH: W. & R. CHAMBERS, 10, N. B. ROSS STREET.

advantage, when they learned one day that Jack—the tremendous Eyesore Jack—had succeeded, through the intervention of an agent, in obtaining a long lease of a large field opposite, on which it was his design immediately to commence a brick-work! The men were like to go wild with vexation; but their whole fortune was at stake, and they determined to fight the old villain to the last extremity. It chanced that another person had been in terms for the leasehold of the field, and had every thing but completed the arrangement. To him the two frantic builders applied. If we recollect the circumstances rightly, it was discovered in conversation that the day on which the bargain was to have been fulfilled, was a holiday, so that the non-fulfilment of the bargain might not necessarily be held as voiding it. On this point the two men fastened with avidity, and they easily succeeded, by various considerations, in inducing the other party to raise an action for recovery of the field. It was destined to be the last of the fields of our friend Jack. He battled it through the medium of the proprietor of the ground as long as he could, but was ultimately cast, with the loss of all his ill-gotten gains. He died not long after in abject penury.

Many examples of modes of living not much more honourable than that of Eyesore Jack might be cited: that of the informer, for one example, might give occasion to a whole paper, or even to a volume. But we shall content ourselves for the present with requesting all who are in the custom of execrating the catiffs who live by such arts, to reflect if there be not something to find fault with in their own line of doing. Many professions pass very well with the world, which, nevertheless, to the eye of a watchful conscientiousness, appear by no means pure or laudable. The test we would have applied is the inquiry, “Does my profession or occupation conduce solely to the good of my fellow-creatures, or is it not rather in some degree a source of evil to them?” Unless the answer, “It does conduce solely to the good of mankind,” can be clearly and readily given, the party may be satisfied that his profession or occupation, however sanctioned by the toleration of the common world, is a vicious one. As such we would hold all those which minister in any way to bad appetites and misleading vanities, as well as all those which depend on the keeping up of strife, whatever gowns and diplomas and honoured appellatives may belong to them. Let none of the professors of such arts or professions presume to execrate Eyesore Jack, until they have come out of their own evil ways.

HEALTH OF SOLDIERS.

It is well known that the range of the military duties of the country occasionally leads portions of our army into situations where the health of the men is exposed to great dangers and vicissitudes. Hence young men, whom choice or circumstances induce to enter the ranks, and who have an aversion to expose themselves to such climates as those of Africa or Guiana, sometimes take the precaution, before enlisting, to select a corps which has been lately abroad, and which is not likely, on that account, to be soon sent from home again. But we question much if any young man desirous to enlist ever thought of giving the preference to one regiment over another, on the score of the rejected one being habitually less healthy, or, in plain words, subject to greater mortality, when both are permanently stationed at home, and are *circumstanced alike* in almost every respect. A Parliamentary Report on the health of the Home Troops, however, proves that certain regiments are thus more liable to deaths than certain other regiments, even where no difference in food, duties, and climate, can be traced. Besides this somewhat remarkable circumstance, there are others noticed in the Report alluded to, which may have some interest for our readers.

Comparing the annual mortality occurring in the regiments of Dragoon Guards serving in the United Kingdom, with that occurring in the regiments of Foot Guards, a very remarkable discrepancy, indeed, is found to exist. The average yearly number of deaths in the Dragoon Guards, from the years 1830 to 1836 (inclusive), amounted to 15.3-10ths in every thousand men. In the Foot Guards, again, the mortality was greater by nearly a third, and this did not arise from any temporary causes, but was in correspondence with the results of previous years. The precise mortality in the Foot Guards amounted to 21.6-10ths in the thousand. To put the difference between the mortality of the two classes of troops in a stronger light, it may be stated, that, between the 1st of January 1830, and the 31st March 1837, the number of deaths in the Foot Guards was 745; and that the

average annual number of men in these regiments, during that period, amounted to 4764. In the same number of Dragoon Guards (and Dragoons serving in the United Kingdom, which are also included in these calculations), the mortality during the same number of years amounted to only two-thirds of 745, or to about 500 persons. This is a fact calculated to arrest attention very forcibly, and to excite curiosity as to its cause. The medical tables in the Report, which detail the diseases to which the whole preceding mortality is owing, and the proportions in which each disease is destructive, show at least the near or immediate cause. The ratio of deaths from diseases of every kind excepting those of the lungs, is, in the Foot Guards, 7.5; in the home Dragoon troops, 7.6. The ratio of deaths from diseases in the lungs alone, is, in the Foot Guards, 14.1; in the Dragoons, only 7.7. This places the comparative total proportions of deaths exactly as before shown.

FOOT GUARDS.		DRAGOON TROOPS.	
Deaths from lung diseases	14.1	Deaths from lung diseases	7.7
.... from other diseases	7.5	 from other diseases	7.6
	21.6		15.3

It is plainly through diseases of the lungs, then, and through diseases of the lungs alone, that the Foot Guards lose, in seven years, nearly two hundred and fifty more men than are lost out of an equal numerical force of the Dragoon Guards and Dragoons. The next question is, to what cause is the prevalence of pulmonary complaints among the Foot Guards to be ascribed? These calculations, as has been stated more than once already, apply exclusively to the home service of all these troops. But the dragoon regiments, though within the United Kingdom, are chiefly resident in provincial districts, or at least are not fixed in the metropolis of the empire, as the Foot Guards almost uniformly are in time of peace. Hence it may be supposed that the climate of London, which is demonstrably less favourable, on the whole, to health than the rural districts, may cause the pulmonary ailments of the Foot Guards; but there are many reasons for determining this supposition, plausible and probable as it seems, to be incorrect. In the first place, “it has been ascertained (we quote the Report) that out of a thousand deaths among the civil population of the city, from 1830 to 1835, the number by diseases of the lungs was 328, being scarcely one-third of the whole; whereas, out of 745 deaths among the Foot Guards, not less than 487, or upwards of two-thirds, were from these diseases.” A second and almost conclusive argument against attributing the pulmonary diseases of the Foot Guards to the metropolitan climate, is derived from examining the extent of the mortality among another class of troops, those usually called the Household Cavalry, and which include only the two regiments called Life Guards, and the one styled the Royal Horse Guards. This class of troops is also exposed to the climate of the capital, yet the total annual deaths from all diseases have averaged only 14.5 in the thousand men, during the seven successive years ending with 1836. Out of these deaths, a proportion only of 8.1 has been from diseases of the lungs, whereas the Foot Guards have lost, as has been stated, 14.1 per thousand from the same causes.

It may be imagined, since the comparison made here has only been between the Foot Guards and cavalry troops, that the latter service may possibly be healthier on the whole, at all times and under all circumstances, than the infantry service. But this does not appear to be the case. The average annual mortality among the infantry serving at home, and without any special drawback upon their health, seems to have always been about 15 per thousand, nearly the same as that in the Dragoons and Dragoon Guards. We are still at a loss, therefore, to explain the cause of the Foot Guard mortality. Captain Tulloch, whose name is appended to the Parliamentary Report on this subject, mentions that the Foot Guards have a comparatively severe amount of night duty to perform; but continues to remark, that this can scarcely afford any explanation, “since even among the troops of the line serving at home, whose constitutions have been deteriorated in some instances by residence in tropical or unhealthy climates, and who have an equal share of night duty to perform, the mortality by diseases of the lungs is much lower.” In short, the Report can find no explanation of the great loss of men in the Foot Guards, excepting by referring to their “moral and physical” habits. In the greater deterioration existing in this respect, the cause appears to the reporter to lie. The subject is one worthy of inquiry. An excess of mortality to the amount of two hundred and fifty men in the course of a few years, when compared (all circumstances being equal) with other regiments, is a matter

calculated forcibly to arrest the attention, it might be thought, of the medical department of the army, and lead to the proposition of steps for the cure of the evil. The young enlisters, alluded to in the commencement of the paper, may be warned by these facts, if very regardful of life and health, that the ordinary regiments of the army present a safer field for military service than the dignified corps of Foot Guards. Nay, the Foot Guards show greater unhealthiness, or rather mortality, than the regiments serving in many foreign countries that are by no means famed for salubrity. At Malta, for example, where such casualties as plague and fever are frequent, the average annual mortality for the last twenty years has been but 16.3 per thousand. That of the Foot Guards at home, it will be remembered, was 21.3.

From the soldiery being in some measure a body of picked men, and from the careful superintendence to which their course of life is subjected, it might be anticipated that the general mortality among them would fall beneath, or be less than, that of civilians, or the community at large. But this is found not to be the case. The mortality in the army, speaking always of home service, is equal to the mortality among civilians where that is at the very highest—namely, in the large cities of the land. In any calculations of this kind, of course, we must keep in view the ages at which men serve in the army. The average age of the whole soldiery has been found to be nearly 30. By the Carlisle tables, which exhibit the mortality of the general population of this country, the number annually decreasing out of a thousand civilians of the age of 30, is about 10. The ratio deduced from the ordinary population returns is about 11.5 per thousand. Now, both of these conclusions fall very considerably beneath the average yearly mortality per thousand of the soldiery, which comes as closely as possible to 15 and a fraction. The cause of this military unhealthiness, it is said, is the residence of the troops in the larger towns, and when we inquire how many civilians of 30 perish there in the thousand, we certainly find that the mortality reaches 15 or 16. This assuredly countenances the supposition that the general health of the army is affected by residence in large towns. One cannot but be still surprised, however, that the army should not, under any circumstances, be a much more healthy body. That men so carefully selected for bodily vigour, and so carefully tended afterwards, should equal in unhealthiness the least healthy divisions of the whole general population of the empire, is a circumstance which one could never anticipate, and which such accurate Reports only, as the one before us, could induce us to believe.

Another very striking circumstance to be gathered from this Parliamentary document, is the number of suicides that take place in the British army. In the statistical tables given by Quetelet, a recent continental writer, the number of suicides committed in different countries is tabularly stated, and compared respectively with the amount of the population. In France there is annually 1 suicide to 18,000 inhabitants; in Prussia, 1 to 14,404; in Austria, 1 to 20,900; in Russia, 1 to 49,182; in the state of New York, United States, 1 to 7797; and in Boston city, 1 to 12,500. In the Dragoon regiments of Britain, however, there takes place annually, or has done at least for the last seven years, 1 suicide in 1274. It is true, that the vast disproportion here is to be viewed with some reservations, seeing that the whole population of a country, including all ages and sexes, is reckoned in the preceding statements from Quetelet, whereas the Dragoons are composed of men only, at the age when suicide most frequently occurs. Yet, all things considered, 35 suicides out of 686 deaths, which was the total mortality among the Dragoon regiments for seven and a quarter years, must be held as a very large proportion. The suicides among the civil population of London are calculated to amount to 1 in 5000. “The proportion (says the Report) of suicides is found to be higher among the Dragoon regiments, however, than any other description of force, probably because these corps contain more of that class who have by dissipation or extravagance reduced themselves from a higher sphere in life to the necessity of enlisting, and on whose minds this change of condition may, in some instances, operate so powerfully as to lead to self-destruction.” The Report styles the subject of military suicides one that particularly claims attention, but does not, so far as we notice, give any conjecture as to the cause of their great comparative frequency. It seems to us that two reasons will go far to explain the matter. The first one hinges on the fact just adverted to, that enlistment is the resource of numerous young men who have ruined themselves already in civil life, and with such individuals not only the Dragoons, but every other corps in the service, is liberally supplied. The second reason is, that the means of self-destruction are ever at the soldier's elbow. The poor wretch of a cit or clerk who has squandered his all at the gaming-table, and who issues from the earthly Pandemonium some hours after midnight in a state of desperation, has probably no pistol at home to end his misery, and ere the morning arrives, bringing with it the opportunity of procuring the deadly instrument, he has tasted sleep, and his brain is cooled, though yet his spirits may be very low. Hope gradually springs up again, and the crisis is past. With the soldier, the case is unfortunately very different. The means of self-destruction are ever at his side, and the first mad impulse to the deed is but too often obeyed in consequence.

Reports such as that before us must be of great value in establishing various important points connected with the comparatively new science of Statistics, on which so many interesting questions in the social and political economy of nations are now seen to depend. On this score alone, these Reports deserve all possible commendation.

THE HON. C. A. MURRAY'S WORK ON AMERICA.

ALMOST every journalising traveller who has visited the American Union of late years, has devoted so much space to tedious and even disgusting details respecting the merely personal habits and manners of the people, that we are delighted to meet with such a tourist as the Hon. Charles Augustus Murray, who gives a plain unpretentious account of what he saw and heard on the other side of the Atlantic, and, making no pretensions to the character of a profound observer, has presented the world with a work brimful of lively description, incident, and adventure.* The author left Britain on the 18th of April 1834, and had got more than a thousand miles out to sea, when the ship sprang a leak that baffled all attempts at discovery, and made the captain glad to run into the Azores, after nine days of extreme peril and incessant labour at the pumps. On again putting to sea, the vessel reached America in safety. Our traveller's account of his sea dangers, as well as of his stay at the Azores, is full of animation and interest. We should also find sufficient matter for the reader's amusement in following Mr Murray in his windings through the United States, the chief cities of which, including New York, Boston, Philadelphia, Washington, Baltimore, Cincinnati, and others, he visited and has described; but we prefer, for the present at least, to pass on to what appears to us a particularly entertaining portion of the work, namely, the narrative of the author's somewhat romantic summer residence with a tribe of Pawnee Indians. He had no intention to perform any such feat originally, but, having descended the Ohio from Cincinnati, and afterwards gone up the Missouri to Fort Leavenburg, the westernmost military station of the United States, he was induced, through a love of hunting and adventure, to take "a hasty but determined resolution" of accompanying a body of Pawnees, then accidentally on a visit to the fort, in their travel inland to the encampments of their tribe. The result of his expedition will go far to undeceive the world respecting the Indian tribes, and to dispel the illusions which have been generated by the specious and exaggerated representations of novelists. In the case of these savages, as in every other similar case, ignorance, it will be seen, is the parent of vice and wretchedness of every kind. With it, the exercise of the better and nobler sentiments of man's nature cannot coexist, and Mr Murray's excursion cannot but do good, in as far as it has enabled him to bear competent testimony to this important truth, in an instance where misapprehension has long prevailed.

With one fellow-traveller and companion, a Mr V—, two attendants, several horses, and a considerable amount of baggage, of which powder and shot, trifling presents for the Indians, and articles of food, formed the most important items, Mr Murray, on the 7th of July 1835, set forth on his travel with the Pawnee party, who took the straight course to join their wives and families, or, in other words, their tribe or village. After a march of fourteen days, rendered most fatiguing by the broken nature of the ground, and by the rapid rate at which the Indians travel, the party came up with the main tribe, then stationed at one of the temporary encampments which they occupy during the hunting or summer season. The grand chief of the tribe gave the white travellers a friendly reception, in return for which Mr Murray expressed his gratitude through a sort of half Pawnee half French interpreter, and gave the circle of chiefs a little brandy and water from his flask. Not wishing, however, to originate in them a relish for ardent liquor, which uniformly debases their character, he diluted the potation largely. "It was not a little amusing to see how readily the Pawnee-French interpreter entered into my views on this subject. I once or twice lent him my small pocket flask, and allowed him to serve out the weak toddy to the chiefs; he talked most gravely of the pernicious effects of spirits among 'les sauvages' (he himself being more than two-thirds of

one), carefully mixed for them at least nine proportions of water for one of brandy, and then, with equal gravity, helped himself to a dram, in which he exactly reversed the aforesaid proportions." Mr Murray then continues—"As soon as this introductory feast was concluded, we accompanied the chiefs to the village, which was about twelve miles ahead of us; at length we came in sight of it, and a more interesting or picturesque scene I never beheld. Upon an extensive prairie gently sloping down to a creek, the winding course of which was marked by a broken line of wood here and there interspersed with a fine clump of trees, were about five thousand savages, inclusive of women and children; some were sitting under their buffalo skin lodges lazily smoking their pipes, while the women were stooping over their fires, busily employed in preparing meat and maize for these indolent lords of the creation. Far as the eye could reach, were scattered herds of horses, watched (or, as we should say in Scotland, 'tented') by urchins, whose whole dress and equipment was the slight bow and arrow, with which they exercised their infant archery upon the heads of the taller flowers, or upon any luckless blackbird perched near them. Here and there might be seen some gay young warrior ambling along the heights, his painted form partially exposed to view as his bright scarlet blanket waved in the breeze; while the banks of the stream were alive with the garrulous voices of women, some washing themselves, their clothes, or their infants, others carrying water to the camp, and others bearing on their backs a load of wood, the portage of which no London coalheaver would have envied them."

This encampment was only a temporary one, but during all the subsequent hunting movements of the tribe, Mr Murray and his servant resided in the tent of an old and most kindly chief, named Sanitsarish, while the other two whites had their abode in another great man's tent. Sanitsarish had a family and several wives, but our traveller dispels all the romantic notions which the pretty Annual tales about Indian girls had instilled into our minds. "Among the Pawnee females (says he) I never saw one instance of beauty, either in face or figure—of neatness in dress, cleanliness in appearance, or of any one of those graceful and attractive attributes which generally characterise the softer sex. Their life is one of perpetual degradation and slavery." A little farther on, our traveller gives the details of a Pawnee wife's daily existence, which would be unsupportable but for the aid derived from her two or three companions in matrimony, who are usually her sisters; for a Pawnee, after marrying an elder sister, has a right to wed all the younger ones in succession, as they grow up. "She (the Pawnee wife) rises an hour before daylight, packs up the dried meat, the corn, and other bales, strikes the tent, loads and saddles all the horses and mules, and at dawn the march commences; they generally go from twelve to fifteen miles before their mid-day halt; the husband *rides*, some animals are loaded, many run loose; she travels on foot, carrying on her back either a child or a package of considerable size, in one hand a bundle or a can of water, with the other leading one or two pack-horses. On arriving at the camping-place, she unpacks the animals, and proceeds to pitch the tent. But in order to appreciate the extreme labour of this apparently simple operation, it must be borne in mind that she has to force eight or ten poles, sharpened at the point, into ground baked nearly as hard as brick by a vertical sun; they require to be driven at least six inches deep by the mere strength of her arms, as she is not assisted by the use of any iron-pointed instrument or any mallet. As soon as the tent is pitched and arranged, she goes in search of wood and water; the latter is generally within half a mile of the camping-place selected, but the former, I can positively affirm from my own observation, she frequently has to seek and carry on her back three or four miles.

From mingled commiseration and curiosity, I have once or twice raised these wood bundles thus brought in, and am afraid to hazard a conjecture at their weight, but I feel confident that any London porter would charge high for an extra load, if he was desired to carry one of them half a mile: she then proceeds to light the fire, cut up the meat, and pound the corn, for which latter purpose she is obliged to use a heavy club, round at the extremity, and a mortar, hollowed by herself from the trunk of a walnut. As soon as the meal is finished, she has to strike the tent, reload the horses, and the whole foregoing work is to be repeated, except that the afternoon walk is generally not more than eight miles.

This is the ordinary routine of a travelling day; but on the day of a hunt, and on its successor, her labour varies in kind, not much in degree, as, besides bringing wood and water, cooking, &c., she has to cut up all the meat into thin flakes or layers to be dried in the sun, to dress the skins and robes, to make the mocassins, leggins, and, in short, whatever clothing is wanted by any part of the family. To perform this incredible labour there were only three women in our lodge, and I never saw any of the three either grumble or rest a moment, although plagued with the additional care and ceaseless crying of two brats. Least it may be supposed that in the permanent or winter lodge they

enjoy more rest, it is as well to mention, that, in addition to their domestic duties, the whole of the agricultural labour, in their coarse system of raising maize, falls to their share. Is it possible to contemplate this constant and severe fatigue, undergone with uncomplaining cheerfulness, without pity and admiration?"

The tents of the savages are covered with skins, and the interior, also, is strewn with skins or mats. Each inmate sleeps on his own blanket or buffalo robe; has his assigned place, with his bow, quiver, saddle, and bridle, close beside him; and thus little confusion prevails, although each individual has only just room to sit or lie at full length. The screaming of sick and spoiled children (who soon convinced our traveller of the absurdity of the assertion that "Indian children never cry"), the babbling of females, and the howling of about four thousand village dogs outside, rendered Mr Murray's nights at first rather uncomfortable. Custom made him sleep in spite of these annoyances, and in spite, also, of the filth of his savage friends and their lodges. The following passage, which we almost scruple to quote, makes one shudder. "Every article within the lodge, including my own skins, jacket, and shirt, was covered with vermin. These insects are, as is well known, of two species; the one frequenting the hair, the other the body. The former of these are considered by the Pawnee naturalists 'Pediculus esculentus'; for whenever the squaws are unemployed in severe labour, they enjoy a feast of this kind, gathered either from the hair of their children or of each other. For many successive weeks I have observed them pass from half an hour to an hour of every day in this manner, and they really seem to eat this filthy vermin with no small satisfaction; but I have been told by traders that they will not eat them from the heads of the whites!"

So much for the personal habits and real condition of those beings who are called in novels "Startled Fawns" and "Sunny Eyes," and who there shine before us in all the simplicity of beads, feathers, and wampum-belts, leaving most Arcadian illusions on our minds. As our chief object at present is to show what a creature man really is,

"When wild in woods the noble savage runs,"

we shall proceed to make such extracts from Mr Murray as illustrate the character of the Indian men. He soon saw that by staying among them he had taken the only method of discovering their true character, and that, had he judged from what he saw of them at Fort Leavenburg, he would have formed the very same notions about their "high sense of honour," their "hospitality," and other imaginary qualities, as others had done before him. "The Indian (says he) among whites, or at a garrison, trading-post, or town, is as different a man from the same Indian at home as a Turkish 'Mollah' is from a French barber. Among whites, he is all dignity and repose; he is acting a part the whole time, and acts it most admirably. He manifests no surprise at the most wonderful effects of machinery, is not startled if a twenty-four pounder is fired close to him, and does not evince the slightest curiosity regarding the thousand things that are strange and new to him; whereas at home, the same Indian chatters, jokes, and laughs among his companions—frequently indulges in the most licentious conversation; and his curiosity is as unbounded and irresistible as that of any man, woman, or monkey, on earth. Truth and honesty (making the usual exceptions to be found in all countries) are unknown or despised by them. A boy is taught and encouraged to steal and lie, and the only blame or disgrace ever incurred thereby is when the offence is accompanied by detection. I never met with liars so determined, universal, or audacious. But from all these charges I most completely exonerate my old chief Sanitsarish; nature had made him a gentleman, and he remained so, in spite of the corrupting examples around him." In proof of their curiosity, Mr Murray states that, on sitting down in any of their lodges, they would examine his whole dress and person with their hands, dive into every pocket about him, take out all the contents, and, in short, investigate him from top to toe.

By a little determined resistance he put a stop to such annoyances, and to still greater ones, arising from the cheating propensities of the savages. On the march from the fort, he had made a bargain for the temporary use of a horse belonging to one of the most noted Braves of the tribe. The Brave wished to draw back from his compact, and sent a message to that effect by the interpreter. Finding the Brave deaf to reason, and seemingly about to use force, our traveller took a determined course, and said to the interpreter, "You know, and he knows, that he is in the wrong. I shall now go and bridle that horse; if he chooses to come and try to take him from me, let him do so at his own risk." The Brave made no such attempt, and evidently respected the white man much more ever afterwards. On another occasion, Mr Murray showed similar determination, and in a case of far greater peril. When desirous to get travelling horses, at the close of his stay with the tribe, he gave to the Grand Chief of the Pawnees a pocket telescope, for which a goodly steed was to be supplied. No steed came, and the traveller went to the chief's lodge, and asked for the horse. "He gave me no answer. I then proceeded to say that 'he was a great chief, and had a single tongue, and that I knew he would not lie to his white brother.' Still the same sulky look, and no answer: in the mean time, I cast my eyes carefully round the interior of his lodge, and at length espied

* Travels in North America during the years 1834, 1835, and 1836, &c. By the Honourable Charles Augustus Murray. 2 vols. London: Richard Bentley.

my telescope hanging at the back of it, near his medicine-bag, &c. Having ascertained its locality, I said I wished to return to the white man's fort, and asked him distinctly, whether he would give me the horse or not? This time he answered briefly and distinctly enough, *ká-ki*, 'no.' I then rose, and, going straight to my telescope, took it quietly down, and hanging it round my own neck, told him it was all right, or very good, and walked deliberately away." This was a most daring act, considering that, at a motion of his finger, the chief could have brought on the unfortunate whites a thousand armed men; but no evil consequences ensued. Mr Murray does not argue from these circumstances that the Indians are deficient in courage, although they never fight fairly, or hand to hand, if they can avoid it. Much even of that *passive* courage or fortitude under pain for which they have been so much praised, disappears from their character under ordinary circumstances; for I have "seen (says the author of the present work) a full-grown strong-looking Indian moan and whine under the toothache or colic in a manner that, among us, would shame 'a sick child!'"

The following amusing description of a young warrior's toilet will show whether or not coxcombry is an Indian attribute. "He began his toilet about eight in the morning, by greasing and smoothing his whole person with fat, which he rubbed afterwards perfectly dry, only leaving the skin sleek and glossy; he then painted his face vermillion, with a stripe of red also along the centre of the crown of the head; he then proceeded to his 'coiffure,' which received great attention, although the quantum of hair demanding such care was limited, inasmuch as his head was shaved close, except one tuft at the top, from which hung two plaited 'tresses.' (Why must I call them 'pig-tails?') He then filled his ears, which were bored in two or three places, with rings and wampum, and hung several strings of beads round his neck; then, sometimes painting stripes of vermillion and yellow upon his breast and shoulders, and placing armlets above his elbows and rings upon his fingers, he proceeded to adorn the nether man with a pair of moccasins, some scarlet cloth leggings fastened to his waist-belt, and bound round below the knee with garters of beads four inches broad. Being so far prepared, he drew out his mirror, fitted into a small wooden frame (which he always, whether hunting or at home, carried about his person), and commenced a course of self-examination, such as the severest disciple of Watts, Mason, or any other religious moralist, never equalled. I have repeatedly seen him sit, for above an hour at a time, examining his face in every possible position and expression; now frowning like Homer's Jove before a thunder-storm, now like the same god, described by Milton, 'smiling with superior love,' now slightly varying the streaks of paint upon his cheeks and forehead, and then pushing or pulling 'each particular hair' of his eyebrows into its most becoming place!"

Sanitairish repeatedly warned the whites never to stray from the encampment after dusk. On one occasion only, Mr Murray and Mr V— neglected the caution of the good old chief, and took a rambling walk, which was suddenly interrupted by the accidental sight of an Indian following and watching them, with his bow in his hand, and his quiver full of arrows. The travellers had no arms but knives, and the manner of the savage alarmed them, especially when they remembered the words of Sanitairish. They took the immediate resolution of facing the man, and of keeping close by him, to prevent the use of his arrows, which, from a Pawnee's hand, sometimes go through the body of a buffalo, and stick in the ground beyond. The plan was put in execution, and the Indian was evidently taken by surprise. Under pretence of friendliness, Mr Murray locked his arm in that of the reluctant savage, and led him towards the camp; but not a word would he utter. His eye was troubled, and his whole look villainous. Just when they came within a safe distance of the camp, the Indian broke from them, and they saw him join two or three others couching behind a hillock, from which the whole soon sneaked away. The travellers had no doubt of the man's having been sent after them as a scout, and that robbery, and murder to accomplish it, was their scheme. Various other occurrences showed that the same unscrupulousness was perfectly common among these "hospitable" Pawnees.

We really find that we have occupied nearly the whole of our available space, without giving even a tithe of the interesting matters connected with this romantic expedition, which ended in the return of the party to Fort Leavenburg, amid circumstances of suffering and peril under which most men would have sunk. Their guides deserted them, and Mr Murray had to take that office upon himself. Even when with the Indians, great hardships were endured, food becoming very scarce when buffalo herds were not to be seen, which was often the case. These hardships will be appreciated when we state that the author of this work, a young gentleman trained to the fare of courts,* gives the following account of a meal made by him. When alone, he shot a young bull, and immediately began to cut the strong liide with his knife. "After

an hour's unremitting work, I succeeded, and then went on to open the body. Without much difficulty I got at the liver, and began to eat, certainly more like a wolf, or Indian, than a Christian man. After devouring several large morsels, I saw a hunter coming towards me at full speed. He had been unsuccessful, and was hungry. I was nearly choked with thirst, and, as soon as he arrived, made him signs, that if he would fetch me water, I would give him as much to eat as he chose. He nodded assent. We then took out the bladder of the buffalo; I told him to wash it well, and bring it back full of clear water. He went off at a gallop, and, in about a quarter of an hour, came back, having executed his commission. I cannot say that the water was quite crystal, but I never enjoyed a more delicious meal than this raw liver, and the water, such as it was. The Indian, also, showed me two or three other morsels, which I found excellent; and I strongly recommend to any gentleman who may ever find himself similarly situated, to break a bone, and suck the marrow." He had not tasted food, it ought to be mentioned, for forty-eight hours. This was not his only meal of the kind.

Altogether, the descriptions of Mr Murray show that the savage life is one full of suffering and discomfort to the body; while, to the mind also, it is a state in which few of the better sentiments and nobler faculties can possibly find room for development. The case of the American Indians being almost the only one where it has been doubted that ignorance is but a synonyme for vice and degradation, these volumes, as has been already remarked, tell a beneficial truth to the world. Not having been able to notice any of his observations upon the United States and other places visited by him, we propose to return in an early number to this lively and entertaining work, which is sure to attain an extended and merited popularity.

THE LIFE AND POETRY OF DARWIN.

ERASMUS DARWIN was a native of the village of Elston, near Newark, in the county of Nottingham. He was born in 1731, and, on reaching a suitable age, was sent to the free-school of Chesterfield. His family circumstances were such as to permit him subsequently to enter St John's College, Cambridge, where, having chosen the profession of a physician, he remained long enough to take out a medical degree. He afterwards visited both London and Edinburgh, with the view of completing his studies at the schools of medicine in those cities.

A satisfactory amount of scientific knowledge having been at length acquired, Dr Darwin endeavoured to establish himself as a physician in Nottingham, but, finding his prospects unfavourable, he removed speedily to Litchfield. His settlement in this city took place in the autumn of 1756, when he had just attained the age of twenty-five. Although Darwin, during his academical career, had displayed a strong bent towards literary, and in particular poetical pursuits, he had the prudence and self-command, at the outset of his professional life, to repress such tendencies, or at least to conceal them from the general eye. Devoting himself to his medical duties, his devotion was rewarded by success. A fortunate cure, during his early practice, fixed his reputation in Litchfield; and in 1757, he was united in marriage to a lady, whose extensive connections in the place tended greatly to advance and strengthen his interests. For twenty-three years after his settlement in Litchfield, Dr Darwin (to use the words of Miss Seward, his biographer) kept "himself bound, with the wisdom of Ulysses, to the medical mast, that he might not follow those delusive sirens, the muses, or be considered as their avowed votary." At the same time, neither his poetical talents nor his philosophical acquirements were any secret to the circle of intimate friends whom he loved to assemble at his hospitable board, and with whom he was wont to speculate on the wonders of nature, in the walks and bowers of a little suburban retreat, which he occupied with his family, and which he had adorned with a botanic garden, and other pleasing tokens of his prevailing tastes. Some of Darwin's intimates were men distinguished for ability; and, indeed, Litchfield could boast of a perfect constellation of noted names about this period, though some were but occasional residents. Messrs Bolton and Watt, men linked together in business and in fame, Mr Kier, Dr Small of Birmingham, Mr Edgeworth, father of Maria Edgeworth, Mr Day, author of "Sandford and Merton," and the Swards, father and daughter, may be mentioned as the principal ornaments of what the lady just alluded to styles "the Darwinian sphere." Mechanical philosophy, as is well known, was the favourite study of almost all these individuals, and the subject of our memoir was endowed with congenial propensities. He was perpetually inventing ingenious but whimsical machines, one of which, a carriage, seems to have been faulty at least in its

practical operation, since the inventor was tossed out of it on one occasion, and had his knee-pan broken.

In 1770, Dr Darwin was deprived of his wife, who left him three sons. Some years afterwards, he formed a romantic attachment to a lady whom he had attended in a professional capacity. There is something a little ludicrous in the details of this passion, which Miss Seward calls "Petrarchan," thereby hinting gently at the fact, that the object of the Doctor's flame, like the famous Laura, was originally the wedded wife of another. When it is taken into consideration that Darwin had arrived at the cool period of middle age, and that he was in person and features exceedingly clumsy, coarse, and uncouth, the Platonic agonies which he gave vent to in verse, and poured into the ears of such sympathising friends as Anna Seward, assume, certainly, a character somewhat comic. To do both the lady and her enamoured swain justice, it ought to be mentioned that neither was encouragement given to this passion on the one side, nor was it sought on the other, until the fair object became a widow, by the decease of her husband, Colonel Pole of Radburne Hall, near Derby. Then did the Doctor use all means and appliances, poetical and prosaic, to win the lady's favour. It appears to have been at this stage of the affair that he composed a little poetical epistle, directing his friend Mr Bolton to make a tea-vase for him, as a present for Mrs Pole. The following lines form a portion of it:—

"Friend Bolton, take these ingots fine,
From rich Potosi's sparkling mine;
With nicest art a tea-vase mould,
And where proud Radburne's turrets rise,
To fair Eliza send the prize."

The poet then proceeds to describe the ornamental figures which he desired to have carved on it. Among other objects, he says,

"Let leaves of myrtle round the rim
And rose-buds, twining, shade the brim.
Perch'd on the rising lid above,
Oh! place a love-lorn turtle dove,
With hanging wing, and ruffled plume,
And gasping beak, and eye of gloom."

The tender lover had ultimately no cause to call himself love-lorn. To state the matter seriously, Mrs Pole, though young and wealthy, had the good sense to choose Darwin for his mind and talents, overlooking his years and personal disadvantages. In consequence of this second marriage, which took place in 1780, he removed in the following year from Litchfield to Derby, and from this time forward became the central figure in a larger group of literary and philosophical persons.

Hitherto he had not given the world at large any written evidence of the genius which private friends knew him to possess. But before he left Litchfield, Miss Seward, as we are informed by herself, wrote a complimentary poem of some fifty lines to the Doctor, being moved thereto on beholding for the first time the beauties of his suburban retreat. According to the lady's account, it was this little piece which suggested to Darwin the idea of his poem called the "Botanic Garden;" and a strong proof of the correctness of the statement is derived from the strange fact, that the Doctor adopted these very lines, without acknowledgment, as the basis of the introduction to the first canto of his poem. He perhaps thought that his alterations were sufficient to make the verses his own, but the retention of even one line (and many were retained) ought to have been acknowledged. Passing over this circumstance as the only serious charge of the kind ever brought against Darwin, we find him busily employed at Derby in prosecuting the composition of his poem, and the fruits of his labour were given to the public in 1789. A portion of his "Botanic Garden" was then published, and this portion, rather oddly, was "Part II," entitled the "Loves of the Plants." Miss Seward supposes this inversion of the common rule to have been caused by the author's persuasion, that the "Loves of the Plants" were better fitted to attain immediate popularity than "Part I," which appeared two years afterwards, under the title of the "Economy of Vegetation." Each of these sections of the "Botanic Garden" contained four cantos of considerable length, with numerous and bulky notes.

The general design of the "Botanic Garden," in the author's own words, "was to enlist Imagination under the banner of Science, and to lead her votaries from the looser analogies which dress out the imagery of poetry, to the stricter ones which form the ratiocination of philosophy." The general name of the poem, as well as of its individual parts, by no means indicates the full extent of the subjects comprised in it. Geology, chemistry, mechanical philosophy, and various other departments of science, are treated of at length, under the plea of describing the "operation of all the elements, as far as they may be supposed to affect the growth of vegetables." The plan taken by Darwin to cast the charm of poetry over science, was to call in the aid of the Gnomes, Sylphs, and Nymphs of the old Rosicrucian doctrines, and to paint them as setting at work all the energies of nature, and effecting the changes that take place in the physical world. To a certain extent, at least, this is the plan of the "Botanic Garden;" but the poet also makes use of yet bolder machinery, and gives a *personified* form to plants, and even to the organs of plants—nay, to inert material bodies also, gaseous, liquid, and solid. By these means he endeavours to throw the charm, resulting from a *sense of life and active agency*, over scientific operations that would otherwise appear prosaic and dull in description. Such seems to have been the rationale of the poet's scheme. In the execution of it, he displayed genius of no common

* Mr Murray is son to the late Earl of Dunmore, and nephew to the present Duke of Hamilton. If we are not mistaken, he has stood on more than one occasion (once since his return from America) for the representation of the county of Lanark. At present, he holds the office of *Master* in the Queen's household.

order. We advert not here to the vast amount of scientific and philosophical knowledge which he exhibited, though in this lay much merit, but to the manner in which he combined and moulded his intractable materials into poetry—to his polished and harmonious versification—to his splendid powers of description—and, finally, to his dazzling command of imagery. Glowing and glittering, from beginning to end, with metaphor and allegory, the "Botanic Garden" was at once determined by the public to be the work of a man of high intellectual abilities and attainments.

All these remarks are equally applicable to the "Temple of Nature, or the Origin of Society," Darwin's only subsequent poem of consequence, and which was a posthumous publication. It will now be proper to present some specimens of his poetry; and the passage on the union or marriage of Oxygen with Light may be first given, as exemplifying several of his most striking peculiarities.

" Sylphs! from each sun-bright leaf, that twinkling shakes
O'er earth's green lap, or shoots amid her lakes,
Your playful hands with smirking lips invite,
And wed the enamoured Oxygen to Light.
Round their white necks, with fingers interwove,
Cling the fond pair with unabating love;
Hand linked in hand on buoyant step they rise,
And soar and glisten in unclouded skies."

These few lines present a fair example of the bold personification spoken of—here so bold, indeed, that most readers will peruse the lines twice ere they can believe that the phrase "white necks" alludes to the pair of elements—Mr and Mrs Oxygen. This nuptial picture occurs in the "Economy of Vegetation," but still more daring are the personifications in the "Loves of the Plants," as, for example:

" Night's tinsel beams on smooth Lochlomonid dance;
Impatient Aëra views the bright expanse;
In vain her eyes the passing floods explore,
Wave after wave rolls freightless to the shore.
Now dim amid the distant foam she spies
A form, a speck—" 'Tis he! 'tis he!' she cries;
As with firm arms he beats the streams aside,
And cleaves with rising chest the tossing tide,
With bended knee she prints the humid sands,
Upturns her glistening eyes, and spreads her hands;
—" 'Tis he! 'tis he! my lord, my life, my love!
Slumber, ye winds; ye billows, cease to move!
Beneath his arms your buoyant plumage spread,
Ye swans! ye halcyons, hover round his head!
With eager step the boiling surf she braves,
And meets her reluctant lover in the waves;
Loose o'er the flood her azure mantle swims,
And the clear stream betrays her snowy limbs.
So on her sea-girt tower fair Hero," &c. &c."

Those who are unacquainted with the writings of Darwin will find some difficulty in guessing to what these fine, smooth-flowing, and rather affecting lines refer. Why, the tender Aëra is neither more nor less than an insignificant sort of aquatic fungus, which floats hither and thither on the waters; and the tender lover is but the fecundating portion of the same vegetable, which is also wafted from one place to another by the winds and waves. This fact being known, all sense of the beauty of the description is almost lost in the smile which the forced and violent nature of the personification can scarcely fail to excite. The manner in which the poet indicates the proportionate number of the organs in various plants, is often most ingenious. For example:

" Sweet blooms Genista in the myrtle shade,
And ten fond brothers woo the haughty maid.
Mendia's soft chains sue suppliant beaux confess,
And hand in hand the laughing belle adores."

This simply denotes, that in the *Broom* and *Cowslip* (American), there are, respectively, ten and five stamens.

" Two Knights before thy fragrant altar bend,
Adored Melissa, and two squires attend."

Here it is announced, by the device of introducing the two grades of chivalry, that in the *Balm flower*, two of its four stamens stand higher than the other two.

" Cupressus dark disdains his dusky bride,
One dome contains them, but two beds divide.
The proud Ostrya flies his angry fair,
Two houses hold the fashionable pair."

The first two lines of this quatrain indicate, that, in the case of the cypress, the stamens and pistils are placed on the same plant, but on different flowers; and that, in the instance of the osyris, these organs are on different plants altogether. Such is the mode in which the science of botany is developed in Darwin's "Loves of the Plants." As the quotation respecting the Aëra will partly show, there is much beauty of description interspersed through the whole poem, although a sense of the unnatural, and a feeling of the ludicrous, are too apt to accompany the perusal, from causes already pointed out.

In the first section of the Botanic Garden, termed the "Economy of Vegetation," Darwin had the more difficult task of throwing into verse the arcana of chemistry, and other sciences loaded with technicalities; yet he got over this obstacle admirably, both as regarded the perfect expression of the sense, and the preservation of ease and harmony of versification. The fact that metallic veins are for the most part found in cracks of the primary rocks, is told in these lines:—

" Gnomes! you then taught volcanic airs to force
Through bubbling lavas their resistless course,
O'er the broad walls of rifted granite climb,
And pierce the rent roof of incumbent lime,
Round sparry caves metallic lusters fling,
And bear phlogiston on their tepid wing."

Hence glow, refulgent tin, thy crystal grains,
And tawny copper shoots her azure veins;
Zinc lines his fretted vault with sable ore,
And dull galena tessellates the floor;
On vermeil beds in Idria's mighty caves,
The living silver rolls its ponderous waves;
With gay refractions bright platina shines,
And studs with squander'd stars his ducky mines;
Long threads of netted gold, and silvery darts,
Inlay the lazuli, and pierce the quartz—
Whence, roof'd with silver, beam'd Peru of old,
And hapless Mexico was paved with gold."

The same polish and glitter pervade the whole poem, and, through this cause, the reader is soon conscious of a wearisome sameness. The structure of the lines, also, is deficient in variety. The subjoined instances, taken from the single page now open before us, exemplify Darwin's favourite form of line.

" Cleaves the dark air, and asks no star but thee."
" Strain their blue eyes, and shriek along the shore."
" Sound their loud conch, and smooth the circling waves."

This double use of the verb in one line is not more common with the poet, than the custom of making the verb precede its noun. In the four lines that follow, there are two instances of this peculiarity.

" Quick whirls the wheel, the ponderous hammer falls,
Loud anvils ring amid the trembling walls,
Strokes follow strokes, the sparkling ingot shines,
Flows the red slag, the lengthening bar refines."

The ear longs in vain for some variety in the pauses. In the whole of Darwin's poetry, we have not been able to notice one single period, or even a semicolon, occurring in the course of a line. This is the more remarkable, as his predecessors, Milton and Dryden, had so finely displayed the beauty and force of such occasional stops or rests. But of all the peculiarities of Darwin's poetry, the most tiresome is the unvarying form in which the illustrations are introduced. The statement of every natural truth is followed by an illustrative similitude, beginning, uniformly and unchangeably, with "So the," &c., or "Thus the," &c. Yet these passages are the finest in his poems. We may aptly conclude our quotations with one episode in honour of Brindley, the canal constructor, a man of great skill in his profession, and so enthusiastically fond of it, that on being asked by a parliamentary committee what he conceived to be the use and design of rivers, he replied, "to feed navigable canals." Addressing his fanciful nymphs, the poet says,

" Your virgin trains on Brindley's cradle smiled,
And nursed with fairy-love the unlettered child,
Spread round his pillow all your sacred spells,
Pierced all your springs, and opened all your wells.
As now on grass, with glossy folds revealed,
Glides the bright serpent, now in flowers concealed;
Far shine the scales that gild his sinuous back,
And lucid undulations mark his track;
So with strong arm immortal Brindley leads
His long canals, and parts the velvet meads;
Winding in lucid lines, the watery mass
Mines the firm rock, or loads the deep morass,
With rising locks a thousand hills alarms,
Flings o'er a thousand streams its silver arms,
Feeds the long vale, the nodding woodland laves,
And plenty, arts, and commerce, freight the waves."

A prose work from the pen of Dr Darwin appeared in two separate parts, in the years 1794 and 1799. This was his "Zoonomia," a treatise which had for its object "to reduce the facts relating to animal life into classes, orders, genera, and species, and by comparing them with each other, to unravel the theory of diseases." On this production the labour of twenty years had been expended, and it exhibited great ingenuity, learning, and research; but the principles developed in it were too hypothetical, and even fantastical, to stand the test of sober and close examination. Another prose work, styled "Phytologia, or the Philosophy of Agriculture and Gardening," possesses similar merits, and is liable to the like objections. A short "Treatise on Female Education" was the only other prose composition of any note which Darwin produced.

The subject of this memoir remained at Derby for the remainder of his life. He died there in April 1802, when he had attained the age of 71. Six children were the issue of his second marriage. It was in the course of the year following his death that the "Temple of Nature" was published. The world did not receive it with the same applause as had been bestowed on the "Botanic Garden," and, indeed, the author himself had lived to witness a considerable decline in the popularity of even the latter and greater poem. Its tinsel and ornament, though captivating at first, did not stand the ordeal of reflection and re-examination. Perhaps the numerous parodies which the strongly marked peculiarities of Darwin's style called forth from "wicked wits," had some share in changing the public taste. His personifications, and his trick of giving precedence to the verb, are well hit off in the following lines, descriptive of a boat passing, or, in waterman's phrase, shooting, London Bridge:—

" So thy dark arches, London Bridge, bestride
Indignant Thames, and part his angry tide;
There oft returning from those green retreats,
Where fair Vauxhallia decks her sylvan seats,
Where each spruce nymph, from city counters free,
Sips the frothed syllabub or fragrant tea,
While, with sliced ham, scraped beef, and burnt champagne,
Her pretence lover soothes his amorous pain;
There oft, in well-trim'd galley, glide along,
Smart beaux and giggling belles, a glittering throng;
Smells the tarred rope—with undulation fine,
Flaps the loose sail—the stikon awnings shine;
" Shoot we the bridge!" the venturesome boatmen cry,
" Shoot we the bridge!" the exulting fare reply."

But the pitiless parodist makes the boat *strike* the bridge, and then

"Laughs the glad Thames, and clasps each fair one's charms,
That streams and struggles in his cozy arms."

It has been often said that the highest order of poetry is most capable of successful parody. The rule, it is to be feared, is not perfectly applicable in this instance, but Dr Darwin's admirers are welcome to give him the benefit of it.

STORY OF SIR ROBERT INNES.

EARLY in the past century, a young gentleman, Robert Innes, fell heir to the baronetcy of Orton, a title of some standing in his name and family. By a concurrence of adverse circumstances, not one rood of land, nor any property whatever, followed the destination of the titular honours. This was particularly hard in his case, as he had received a liberal education, and such a general training, in short, as is usually bestowed on heirs presumptive or apparent to titles that have a substantial amount of acres appended to them. After this statement, it is scarcely necessary to say, that Robert Innes was brought up to no useful art or profession by which a livelihood might be won.

Few situations could be more painful than that in which the young baronet found himself when he acquired the right to place before his name the important monosyllable which entitled him to hold a prominent place in society, while at the same time he was totally devoid of the means of maintaining that place with fitting credit and respectability. It is true that, having enjoyed various opportunities of viewing the ways of high life, he knew very well that many needy fashionables, and even men of title, contrive to pass their lives in apparent ease and splendour, by clinging tenaciously to the skirts of wealthy relatives and friends, or by preying on strangers not sufficiently experienced or sage to be secure against the toils of the high-bred sharper or jockey. Sir Robert Innes knew that men in the like circumstances with himself lived, nay flourished, after this manner and fashion; but he was endowed with a spirit too honourable and manly not to revolt at the thought of eating the bread either of swindling or of servility. He therefore felt his position to be one of extreme difficulty, and was for a time altogether at a loss how to procure his maintenance, in a manner consistent with the preservation, not of his rank and dignity, but simply of honesty and independence of character. It may well be believed that he envied the craftsmanship even of the humblest artisan, who had learned to look to his hands, and his hands alone, for subsistence. But all trades, arts, and professions, seemed in a measure closed against Sir Robert, since he possessed not the necessary means to train himself for any particular employment, even if that could have been effectively done at the comparatively advanced period of life which he had attained. One profession only, if it may be properly so called, remained open to him, namely, the profession of arms, and to this the young baronet naturally turned his attention. Had he besieged the doors of those who had known his family in better days, he might possibly have at once entered the military service in a station corresponding with his social rank; but the risk of encountering scornful refusals, and other such-like fears and feelings, caused the indigent baronet to shrink from becoming a petitioner, desirable as it would have been to attain the object in question. He therefore preserved the independence which he loved, by entering the British army in the capacity of a private soldier. The — dragoons was the body in which he enrolled himself, retaining his own name, but dropping, of course, the title which had descended to him from his ancestors.

In this condition Sir Robert Innes remained for a considerable time, fulfilling regularly and peacefully the duties imposed upon him, and giving no expression to the regrets which could not but occasionally arise in the breast of one moving in a sphere so far below that to which he was suited by birth and education. The monotonous tenor of his life was at length broken in upon in an unexpected and remarkable way. While standing sentry one evening at the quarters of Colonel Winram, the commander of the regiment, he was accosted by a stranger, apparently an officer of another regiment, who inquired if the colonel was at that moment engaged. The sentinel courteously answered that he believed he was, but probably would soon be at leisure, and then recommenced his short perambulations. The stranger followed, and continued the conversation, in order, ostensibly, to while away

the time, until the colonel should be at liberty to receive him, but in reality to satisfy himself on a point of curiosity which had sprung up in his mind. We shall not say more respecting this conversation, than that it served, by its tenor, as far as correct expression and judicious remark on the part of the young soldier were concerned, to confirm the stranger in the suspicion to which some glimmering recollection of features had given rise. When the gentleman who had been in conference with Colonel Winram was seen to depart, the stranger took leave of the sentinel, and entered the commandant's quarters.

"Colonel," said the officer, after paying his respects on entrance, "you are at present more highly honoured in one point than many crowned heads, though you may not be aware of it." "How may this be, my good friend?" asked the veteran. "In respect of your attendant sentry," said the officer; "few princes can boast of a more honourable guard than the one now pacing backwards and forwards in front of your quarters." The old colonel was surprised at the grave assertion of his visitor. "What mean you?" said he; "you seem serious, and yet there can be nobody now on duty as sentry but one of the common soldiers of the corps, who have all been heretofore over and over again." "This may be," returned the visitor; "but I still assure you that you have a rare and remarkable guard of honour at present, in as far as you have a Scottish knight baronet, of old creation, standing sentry at your threshold." "Bless my heart, do you really say so?" exclaimed Colonel Winram, who, though a worthy man and an approved soldier, carried his veneration for titles and family honours somewhat to excess. "A man of title doing duty in the ranks of my corps!" continued the veteran; "how, in the name of wonder, came this about, and how did you discover it?" "I had seen Sir Robert Innes several years ago, before he came to the title, and while its late possessor still retained enough of the family property to keep himself and his heir in tolerable condition as far as appearances went. When it was discovered, on the accession of this young gentleman, that his ancestral possessions had long been in the deceptive condition of a husk with the kernel gone, many individuals who had known Robert Innes, and had admired his manly and virtuous character, were anxious to aid and befriend him; but the youth disappeared suddenly from society, and the rumour went that he had entered the army. Having heard of this report, I was much struck to-night by the look and bearing of the sentry whom I saw at your porch, and a closer examination satisfied me that the soldier was indeed no other than Sir Robert Innes of Orton."

"Gracious powers! can this be true?" exclaimed the veteran, and moved hastily to a window from which he could command a view of his titled sentinel. Being over and over again assured by his friend that the young soldier was no other than the person who had been described, he immediately gave orders to have another private brought on duty, and the hero of our tale ushered into his presence. When the young man appeared before his commander, the latter plainly and candidly stated what had been communicated to him, and asked if it was true that he really addressed Sir Robert Innes. The youth, after colouring a little from surprise, and partly, perhaps, from other feelings, owned that the information given to the colonel was correct, and that he was really Sir Robert Innes. Colonel Winram was silent for a few moments, and then said, "Believe me, young gentleman, when I ask you to inform me personally of the true motives which induced you to enter the ranks, I have a sincere wish to serve you, and am not actuated by mere curiosity." Sir Robert answered his commander by simply stating, that, finding himself possessed of a title without any of the requisite means for supporting it creditably, he had been under the necessity of quitting the society of his equals in station, but superiors in point of fortune. "I close," said he, not without a degree of honourable pride, "to enter on the humble yet independent condition of a common soldier, rather than make any attempt at gaining a maintenance in my own degree, by drawing on the bounty of others, and eating what must have been, at best, the bread of dependence."

A tear trickled down the brown cheek of the old colonel, as he listened to the explanation. "I admire your candour, sir," said the veteran, "and I honour your sentiments. You must be replaced in your proper station—in that station to which you were born, Sir Robert, and to which you will be a credit and an ornament. Thank heaven, I have interest enough, I think, to procure you a cornetcy; and a cornetcy of British horse is a fitting station for any one—for the first noble in the land." The poor young soldier, in whose fortunes a great change was thus unexpectedly promised, could scarcely find language to thank his warm-hearted benefactor and commander. But the colonel did not give himself time to listen to thanks. "I think I am sure of the cornetcy on application," continued he; "but, at the worst, I can procure your discharge, and do something for you in other ways." Pursuing his kindly intentions farther, the colonel gave our hero a temporary release from regimental duty, and invited him to dinner on the following day, offering him for this purpose the use of a spare suit of plain clothes from his own wardrobe. Sir Robert joyfully accepted the invitation, but de-

clined the use of the colonel's wardrobe, as he had chanced to retain a suit of his own, which was still capable of making a respectable appearance.

The young baronet dined with his commanding officer, not once, but again and again; for the cornetcy of horse was obtained for Sir Robert Innes, and he became daily a greater and greater favourite with Colonel Winram, who found his protégé fulfil all the high promise that had appeared in him at their first interview. Handsome, well bred, and accomplished in all the qualifications of a gentleman, Sir Robert was indeed very generally esteemed by his brother officers and all who met him in society. It was barely possible, however, for any one to view him with the measureless partiality of the old colonel, and of this the following conclusive occurrence will give ample proof. After the new cornet had held his station for some months, the veteran asked his youthful friend to join him in an excursion to the country. The request was of course cheerfully complied with, and the pair set out in the colonel's carriage. After they had gone a considerable way, the colonel told Sir Robert that his daughter and only child was then, for the completion of her education, residing at a neighbouring boarding-school, and that he was going to visit her. The boarding-school was accordingly reached, and Sir Robert in due time had the honour of being introduced to the only child of his benefactor. She was a young lady in the very spring of womanhood, and beautiful in countenance, though the full graces of her person were scarcely yet developed. The Scottish baronet thought to himself that he had scarcely ever seen filial affection under a more captivating aspect than when Miss Winram, unconscious of a stranger's presence, ran into the room to welcome her father, whose carriage she had seen at a little distance. In short, Sir Robert Innes thought the daughter of his old friend the most charming girl he had yet seen, and the impression was not decreased by her modest, yet lively and intelligent conversation. When the visit drew to an end, he was even a little discomposed, while the veteran exhibited a more open degree of parting sadness. The young lady also looked regretful, but that of course was accounted for as relating to the departure of her father.

The colonel and his young friend were not very communicative for some space. At length the colonel half unconsciously exclaimed, "She is much improved," to which the other, with equal absence of mind, replied, "She is quite lovely." The easy manner in which the stream of talk from the lips of each, thus set in motion, ran into one channel, showed on what subject their thoughts had been bent. "Do you really like her?" said the colonel abruptly, turning to his companion. Sir Robert blushed, and stammered a little as he replied, "I—I admire her much—it is impossible for any one not to do so, even on seeing Miss Winram for so short a time as I did." The colonel no doubt heard this answer, but he pursued his own train of thought and reasoning. "Because," said he, "if you do like her, I think she might do worse than take you for a husband." The young man was completely stunned for the moment by this most unlooked-for overture. He could not believe that the veteran meant to sport with his feelings, yet some such notion suggested in part the answer which he gave to the colonel, after a pretty lengthened pause. "Colonel Winram," said he, "I am poor—penurious—and you are wealthy. All I have I owe to you, but—" The veteran somewhat impatiently interrupted the baronet. "Well, well, that is exactly what I am thinking of. Margery happens to have a neat enough little fortune of her own, the bequest of a deceased aunt, and you have a title; a fair equivalent. I have always honoured ancestral dignities, at least when borne by such as yourself, whom I already love as a son. My girl has been a good—a very good daughter, and will be a good wife. So again I say, if you like her—" While the words were yet on his lips, fortune, or chance, or farmer Thorpe of the Grange's boy Giles, suddenly gave an unexpected turn to affairs, by sending a troop of yearling cattle scampering into the highway, from the open gate of a park. The horses of the colonel's carriage were startled, and by their sudden bound aside, the reins were twined from the coachman's hands. Feeling no control, the alarmed horses sprang forward at full speed, but they went no great way, ere their divergence from the mid line caused a violent overturn of the vehicle into a shallow side-ditch. The inmates, who had travelled in barouche fashion, were thrown clear out upon one side of the road—which, fortunately, was a grass common. The coachman and Sir Robert Innes, being both of light frames, were very little injured, but the poor veteran's fall was a heavy and severe one. He lay at first perfectly insensible, with his usually ruddy complexion changed to an ashy whiteness. In a few minutes, however, he regained his consciousness, and in some degree his bodily strength, but complained much of pain in his chest and shoulder. Sir Robert, as may be supposed, was greatly agitated, and at a loss how to get his kind friend within reach of immediate advice and assistance. But the coachman was able, happily, to get the horses quieted and the coach raised with the baronet's assistance, and it was resolved to move slowly backward to the boarding-school, from which they were only a mile and a half distant.

The distress of Miss Winram, on seeing her kind-hearted father return so unexpectedly and in such a condition, was extreme, and her solicitude was fully

participated by her instructress, Mrs Batty, who instantly dispatched a messenger for the surgeon of the district. This functionary soon arrived, and relieved a material portion of the pain suffered by the veteran, who, however, continued to be very feeble, and was besides discovered to have fractured one of his ribs. He occupied a sickbed for several weeks. In that time, he had such a nurse in his daughter, as often made him weep tears of gratitude to heaven for its kindness in giving her to him. Our readers may well imagine that such a spectacle as this was a dangerous one for our Scottish knight, who had also continued in attendance. In truth, this young gentleman surrendered his whole heart to the veteran's daughter, and did it willingly and consciously, having no alloy in his hopes for the future, excepting in as far as the state of the young lady's affections was unknown to him. But in his capacity of occasional attendant on the veteran, the young baronet appeared in almost as favourable a light to Miss Winram, as she did to him, and this was soon brought to decisive proof. One day, when the old gentleman was clearly and rapidly in a way of recovery, he insisted upon the two young people taking the recreation of a walk, of which, he said, he was sure that Margery at least was greatly in need, after so much confinement. The young lady would have hesitated, but was overpowered by her father, who, while she was putting on her bonnet in her own room, hastily said to his young favourite, "She loves you, my dear boy; I have noticed her feelings and her looks at your goings and comings. She loves you, and you say you now adore her—is that the word? Ask her at once to marry you, then; and, what is more, persuade her to be the breaker of the matter to me. Gratify me in this, my dear fellow, though it is only a sort of whim that has come into my head."

Sir Robert Innes found that the little heathen gentleman with the wings—whose name has been so long hackneyed and profaned in our literature, that the very mention of it now, in prose or verse, is almost to ensure certain ridicule and condemnation, and whom, therefore, we shall leave our readers to name for themselves—had made such conclusive preparatory way in his favour, that he had no difficulty in winning from Margery Winram an acknowledgment of reciprocal regard and affection. It was rather more difficult to make her the bearer of the news to her father. "My dear Miss Winram," said the young baronet, "I am poor—indeed, utterly penniless. I owe to your noble-hearted father my recovered station, and all that is now prized by me. The thought that he should regard me—his dependent almost—as having insidiously stolen the affections of his daughter—" "Have you not?" interrupted Miss Winram, archly but blushing. "Dearest Margery," replied Sir Robert, ardently, "this indirect confession is more delightful than the other! But, listen to me. You know what feelings I would express, and what are the motives that lead me most earnestly to wish you should appear, as far as possible, to be acting from your own unbiassed will and choice. Grant me, dear Miss Winram, this one request." The lover prevailed, and the lady took upon her the task of hinting, at least, the state of their mutual affections to her invalid parent.

It was after anxiously arranging his pillow, and taking her own seat a little behind the curtain of his couch, that Miss Winram began to her promised disclosure. Her air and looks announced perfectly to the gratified veteran that the time was come. He resolved to help her a little. "You are now getting quite a great girl—I beg pardon, I should have said quite a grown-up young lady, Margery." "Yes, papa," said the daughter eagerly, falling at once into the toils; "I am now within two months and four days of eighteen, and at that age—nay, seven days less—Miss Tipper was married out of this very house." "And has she been happy?" "Oh yes," replied Miss Winram, "very, very happy." "But you, you giddy little thing, have never been so long serious at any time as to think of marriage, I suppose," was the veteran's leading rejoinder. "Oh yes, papa," replied the daughter, "I have thought of it a little." "Then tell me, to amuse me, what kind of husband you would prefer; I mean, as to his looks and his character, and such points. Tell me your ideas, Margery, about these particulars," said the veteran. The daughter paused a moment ere she began. "I should wish him, first of all, to be a person liked by you, papa. (Well hit, thought the old colonel.) I should wish him to be fair in complexion, with blue eyes and brown hair; and to be handsome, good-natured, intelligent, and a soldier, like my dear papa." "Why, girl, you are describing Robert Innes." The young lady rose, and stooped till her face was near the veteran's shoulder. "Yes, dear father, it is Sir Robert Innes who was in my mind," said she. "We love one another. Will you break your poor Margery's heart or not, papa?" "No, God bless thee, my sweet and innocent one, I will not," exclaimed the veteran, moved to tears.

Our story now draws to a close. The marriage took place as soon as the veteran could leave his couch, and the career of the young Scottish knight, whom our narrative took up in so unpromising a condition, was, by the remarkable incidents detailed, rendered one of much happiness throughout the whole of its after-duration. His beautiful lady brought him one sole child and daughter, whose personal charms in time attracted the admiration of the noblest in the land. One suitor for her hand was a gentleman who after-

wards acceded to the title of Duke of Roxburgh; but, eventually, Miss Innes of Orton became the wife of the sixteenth Lord Forbes. Her son is the present possessor of that ancient title, and of her daughters one became Duchess of Athol, and another the wife of Sir John Hay of Hayston.

This history would be thought one of Fiction's pleasant improbabilities, if told in the pages of a novel. We assure our readers, however, that the main incidents in the narrative have been described to us, upon good authority, as being perfectly true.

THE KENT DISTURBANCES.

FIRST ARTICLE.

THE extraordinary transactions in Kent in May 1838 broke upon the public ear with a startling novelty, and for a time excited much attention. But the discussions to which these transactions led were in general directed to points of minor consequence: in the House of Commons, for instance, the only thing apparently considered of any importance was the question—who had the blame of letting the leader out of his cell in the lunatic asylum! Since then the matter has been taken up in its true light, as an astounding revelation of the intellectual and moral condition of the humbler classes of English rural society. At the request of the Central Society of Education, Mr F. Liardet visited the district where the events took place, for the purpose of ascertaining, as far as possible, what was that condition; and the result of his inquiries has just been given to the world in an elaborate paper in the third volume of the publication issued by the society. We propose here to give two papers on the subject—the first a detail of the transactions, compiled with care from the best accounts published in the contemporary journals, and the second an abridgement of Mr Liardet's report. The first is probably necessary in a great measure to a thorough understanding of the second, and perhaps it may also have some utility as a permanently accessible record of what we cannot but consider as one of the most remarkable domestic events of modern times.

The hero of the Kent disturbances was John Nicolls Thoms, the son of a small farmer and maltster at St Columb in Cornwall. He appears to have entered life as cellarman to a wine-merchant in Truro. Succeding to his master's business, he conducted it for three or four years, when his warehouse was destroyed by fire, and he received £3000 in compensation from an insurance company. Since then, during more than ten years, he had been in no settled occupation. In the year 1833, he appeared as a candidate, successively for the representation of Canterbury and East Kent, taking the title of Sir William Percy Honeywood Courtenay, Knight of Malta and King of Jerusalem, and further representing himself as the owner by birth-right of several estates in Kent. His fine person and manners, and the eloquent appeals he made to popular feeling, secured him a certain degree of favour, but were not sufficient to gain for an obscure adventurer a preferment usually reserved for persons possessing local importance and undoubted fortune. Though baffled in this object, he continued to address the populace as their peculiar friend, and kept up a certain degree of influence amongst them. He is supposed to have connected himself also with a number of persons engaged in the contraband trade, as, in July 1833, he made an appearance in a court of law on behalf of the crew of a smuggling vessel, when he conducted himself in such a way as to incur a charge of perjury. He was consequently condemned to transportation for seven years, but, on a showing of his insanity, was committed to permanent confinement in a lunatic asylum, from which he was discharged a few months before his death, on a supposition that he might safely be permitted to mingle once more in society.

Thoms now resumed his intercourse with the populace, whose opinion of him was probably rather elevated than depressed by his having suffered from his friendship for the smugglers. He repeated his old stories of being a man of high birth, and entitled to some of the finest estates in Kent. He sided with them in their dislike of the new regulations for the poor, and led them to expect that whatever he should recover of his birthright, should be as much for their interest as his own. There were two or three persons of substance who were so far deluded by him as to lend him considerable sums of money. Latterly, pretensions of a more mysterious nature mingled in the ravings of this madman; and he induced a general belief amongst the ignorant peasantry around Canterbury, that he was either the Saviour of mankind sent anew upon earth, or a being of the same order, and commissioned for similar purposes. One of his followers, when asked, after his death, by the correspondent of a newspaper, how he could put faith in such a man, answered in language of the following tenor:—"Oh, sir, he could turn any one that once listened to him whatever way he liked, and make them believe what he pleased. He had a tongue which a poor man could not get over, and a learned man could not gainsay, although standing before him. He puzzled all the lawyers in Canterbury, and they confessed that he knew more of

law than all put together. You could not always understand what he said, but when you did, it was beautiful, and wonderful, and powerful, just like his eyes; and then his voice was so sweet! And he was such a grand gentleman, and sometimes latterly such an awful man, and looked so terrible if any one ventured to oppose him, that he carried all before him. Then again he was so charitable! While he had a shilling in his pocket, a poor man never should want. And then such expectations as he had, and which nobody could deny! He had papers to prove himself to be either the heir or right possessor of Powderham Castle, and Evington, and Nash Court, and Chilham Castle, and all the estates of the families of the Courtenays, the Percies, and Honeywoods, and of Sir Edward Hales, and Sir Thomas Hindlay, more than I can tell you. And there was Mr — of Boughton, who lent him £200 on his title-deeds, and the waiter of the — Hotel in Canterbury, who lent him £73, besides other respectable people throughout the county, who let him have as much money on his estates as he pleased, and have kept up a subscription for him ever since he was sent back to jail in 1833, about the smugglers he befriended. And at that same time it was well known that he need not have gone to prison unless he liked, for the very ladies of Canterbury would have rescued him, only he forbade them, and said the law should be fulfilled. I myself saw them kissing his hand and his clothes in hundreds that day, and there was one woman that could not reach him with a glass of cordial gin; she threw it into his mouth, and blessed him, and bade him keep a bold heart, and he should yet be free, and King of Canterbury!"

It is further to be observed that the aspect of the man was imposing. His height approached six feet. His features were regular and beautiful, a broad fair forehead, aquiline nose, small well-cut mouth, and full rounded chin. The only defect of his person was a somewhat short neck; but his shoulders were broad, and he possessed uncommon personal strength. Some curious significations of the enthusiasm he had excited were afterwards observed in the shape of scribbles on the walls of a barn. On the left side of the door were the following sentences:—"If you new he was on earth, your harts Wod turn;" "But dont Wate to late;" "They how R."* On the right side were the following:—"O that great day of judgement is close at hand;" "It now peeps in the dor every man according to his works;" "Our rites and liberties We Will have."

On Monday, the 28th of May, the phrensy of Thoms and his followers seems to have reached its height. With twenty or thirty persons, in a kind of military order, he went about for three days amongst the farm-houses in Boughton, Sittingbourne, Boulton, and other villages in the vicinity of Canterbury, receiving and paying for refreshment. One woman sent her son to him, with a "mother's blessing," as to join in some great and laudable work. He proclaimed a great meeting for the ensuing Sunday, which he said was to be "a glorious but bloody day." At one of the places where he ordered provisions for his followers, it was in these words, "Feed my sheep." To convince his disciples of his divine commission, he is said to have pointed his pistol at the stars, and told them that he would make them fall from their spheres. He then fired at some star, and his pistol having been rammed down with tow steeped in oil, and sprinkled over with steel filings, produced, on being fired, certain bright sparkles of light, which he immediately said were falling stars. On another occasion he went away from his followers with a man of the name of Wills, and two others of the rioters, saying to them, "Do you stay here, whilst I go yonder," pointing to a bean-stack, "and strike the bloody blow." When they arrived at the stack, to which they marched with a flag, the flag-bearer laid his flag on the ground, and knelt down to pray. The other then put in, it is said, a lighted match; but Thoms seized it, and forbade it to burn, and the fire was not kindled. This, on their return to the company, was announced as a miracle.

On Wednesday evening he stopped at the farm-house of Bossenden, where the farmer Culver, finding that his men were seduced by the impostor from their duty, sent for constables to have them apprehended. Two brothers, named Mears, and another man, accordingly, went next morning, but on their approach Thoms shot Nicolas Mears dead with a pistol, and aimed a blow at his brother with a dagger, whereupon the two survivors instantly fled. At an early hour he was abroad with his followers, to the number of about forty, in Bossenden or Bleanwoods, which were to have been the scene of the great demonstration on Sunday; and a newspaper correspondent reports the following particulars of the appearance and doings of the fanatics at this place, from a woodcutter, who was following his business at the spot:—"Thoms undertook to administer the sacrament in bread and water to the deluded men who followed him. He told them on this occasion, as he did on many others, that there was great oppression in the land, and indeed throughout the world; but that if they would follow him, he would lead them on to glory. He depicted the gentry as great oppressors, threatened to deprive them of their estates, and talked of partitioning these into farms of forty or fifty acres among those who followed him. He told them he had come to earth on a cloud, and

that on a cloud he should some day be removed from them; that neither bullets nor weapons could injure him or them, if they had but faith in him as their Saviour; and that if ten thousand soldiers came against them, they would either turn to their side or fall dead at his command. At the end of his harangue, Alexander Foad, whose jaw was afterwards shot off by the military, knelt down at his feet and worshipped him; so did another man of the name of Brankford. Foad then asked Thoms, whether he should follow him in the body, or go home and follow him in heart. To this Thoms replied, 'Follow me in the body.' Foad then sprang on his feet in an ecstasy of joy, and with a voice of great exultation exclaimed, 'Oh, be joyful! Oh, be joyful! The Saviour has accepted me. Go on—go on; till I drop I'll follow thee!' Brankford also was accepted as a follower, and exhibited the same enthusiastic fervour. At this time his denunciations against those who should desert him were terrific. Fire would come down from heaven and consume them in this world, and in the next eternal damnation was to be their doom. His eye gleamed like a bright coal whilst he was scattering about these awful menaces. The woodcutter was convinced that, at that moment, Thoms would have shot any man dead who had ventured to quit his company. After this mockery of religion was completed, the woodcutter went to Thoms, shook hands with him, and asked him if it was true that he had shot the constable. 'Yes,' replied Thoms, coolly, 'I did shoot the vagabond, and I have eaten a hearty breakfast since. I was only executing upon him the justice of heaven, in virtue of the power which God has given me.'

The two repulsed constables had immediately proceeded to Faversham, for the purpose of procuring fresh warrants and the necessary assistance. A considerable party of magistrates and other individuals now advanced to the scene of the murder, and about mid-day (Thursday, May 31) approached Thoms's party at a place called the Osier-bed, where the Rev. Mr Handley, the clergyman of the parish and a magistrate, used every exertion to induce the deluded men to surrender themselves, but in vain. Thoms defied the assailants, and fired at Mr Handley, who then deemed it necessary to obtain military aid before attempting further proceedings. A detachment of the forty-fifth regiment, consisting of a hundred men, was brought from Canterbury, under the command of Major Armstrong. A young officer, Lieutenant Bennett, who belonged to another regiment, and was at Canterbury on furlough, proposed, under a sense of duty, to accompany the party, on the condition that he should be allowed to return before six o'clock to dine with some friends. At the approach of the military, Thoms and his men took up a position in Bossenden Wood, between two roads. Major Armstrong divided his men into two bodies, of equal numbers, that the wood might be penetrated from both of these roads at once, so as to enclose the rioters: the one party he took command of himself; the other was placed under the charge of Lieutenant Bennett. The magistrates, who accompanied the party, gave orders to the officers to take Courtenay, as Thoms was usually called, dead or alive, and as many of his men as possible. The two parties then advanced into the wood by opposite paths, and soon came within sight of each other, close to the place where the fanatics were posted. A magistrate in Armstrong's party endeavoured to address the rioters, and induce them to surrender; but while he was speaking, the unfortunate Bennett had rushed upon his fate. He had advanced, attended by a single private, probably for the purpose of calling upon the insurgents to submit, when the madman who led them advanced to meet him, and Major Armstrong had just time to exclaim, "Bennett, fall back," when Thoms fired a pistol at him within a few yards of his body. Bennett had apprehended his danger, and had his sword raised to defend himself from the approaching maniac: a momentary collision did take place between him and his slayer, but the shot had lodged with fatal effect in his side, and he fell from his horse, a dead man. Thoms fought for a few seconds with others of the assailants, but was prostrated by the soldier attending Mr Bennett, who sent a ball through his brain. The military party then poured in a general discharge of fire-arms on the followers of the impostor, of whom nine were killed and others severely wounded, one so fatally as to expire afterwards. A charge was made upon the remainder by the surviving officer, and they were speedily overpowered and taken into custody.

A reporter for the Morning Chronicle, who was immediately after on the spot where this sad tragedy was acted, gave the following striking account of the local feeling on the occasion:—"The excitement which prevails here, in Boulton, the scene of the murder of Lieutenant Bennett, and of the punishment of his assassins, and the wretched peasantry who were deluded and misled by Courtenay, exceeds any thing I ever before witnessed. It was evident upon listening to the observations of the peasantry, especially of the females, that the men who have been shot are regarded by them as martyrs, while their leader was considered and is venerated as a species of divinity. The rumour amongst them is, that 'he is to rise again on Sunday.' Incredible as it may appear, I have been assured of this as a positive fact with respect to the utter folly and madness of the lower orders here. A more convincing proof of the fanaticism that prevails cannot

* Apparently, *They who err*.

be afforded, than the fact that a woman [by name Sarah Culver] was apprehended yesterday, who was discovered washing the face of Courtenay, and endeavouring to pour some water between his lips. She, upon being interrogated, declared that she had that day followed him for more than half a mile with a pail of water, and her reason for it was, that he had desired her, if he should happen to be killed, to put some water between his lips, and he would rise again in a month! One of the prisoners, Wills, who had received a slight wound from Major Armstrong, the commander of the party, told him that he and the other men who were with Courtenay would have attacked two thousand soldiers, as they were persuaded by Courtenay that they could not be shot, and it was under this impression they were determined upon fighting."

Another local observer reports:—"Such is the veneration in which numbers here hold Thoms, that various sums of money have been offered to obtain a lock of his hair, and a fragment of the blood-stained shirt in which he died. The women, with whom he was a prodigious favourite, seek these relics with the greatest avidity, and are described as receiving them with the most enthusiastic devotion." We are also told that the clergyman who officiated at his interment deemed it prudent to omit the usual allusions to the resurrection, from a fear of encouraging the delusion in which the populace still remained respecting him.

Two of the rioters were tried at Maidstone, August 9, on the charge of being principals with Thoms in the murder of Nicolas Mears, and found guilty. Eight were tried on the ensuing day, charged with the murder of Lieutenant Bennett; they pleaded guilty, and received the appropriate sentence. It was, however, thought proper that capital punishment should not be inflicted on these men, seeing that they had been acting under infatuation.

EXTRAORDINARY ADVENTURES OF WILLIAM RINKLE.

In the London papers, a few weeks ago, appeared a report respecting an application made by one William Rinkle to a metropolitan magistrate for advice and assistance under very extraordinary circumstances—so extraordinary, that the case appears to merit a more durable chronicling than that of the newspapers:—

"Rinkle stated that in the month of March 1832, he sailed from the port of London in a South Sea whaler, belonging to a very respectable firm in Rotherhithe. The ship had been at sea about fourteen months, when the crew were fortunate enough to meet with two whales. After the whales had been killed, all hands were busily employed in securing the blubber, when an accident happened to him of a very serious nature. The spade he was using slipped, and cut one of his feet very severely. One main artery was severed, and he bled so profusely that he was obliged to leave off work. He was conveyed below, and the captain and mate soon afterwards came to him, and accused him of cutting himself to escape his share of the labour. He indignantly repelled the accusation, and displayed his foot, which was in such a state that he could not stand. Some words arose, and the mate gave him a severe blow on the head, which stunned him. On recovering his senses, he was conveyed to the after-hatchway, where he was confined as a close prisoner for two months, and was fed on a scanty allowance of bread and water. During this period he suffered the most dreadful torture from the wound in his foot, owing to improper treatment and neglect. A lock-jaw ensued, and it was necessary to force open his mouth with an iron spoon, to enable him to swallow food sufficient to sustain life; indeed, on one occasion it was requisite to cut the lower lip, to accomplish this object. (The man exhibited his lip, on which a large scar was distinctly visible.) After he had in some degree recovered, the captain directed that he should beg his pardon before all the ship's company. He declined doing so, and the captain immediately gave orders for him to be put on shore on an island near the Japanese dominions, from which they were not far distant. Accordingly, signs were made to the natives, who were watching the vessel from the shore, and a great number of them speedily came alongside in canoes, but they all refused to have any thing to do with putting him on shore, and threats and persuasions were alike ineffectual. At length the captain gave directions to the cooper to knock off the iron hoops from some casks, and bribed the natives of the island, called St Andrew's, forming one of a numerous group, to receive him. In addition to the iron, spirits were liberally supplied to the natives, and while they were rolling about in a state of intoxication, the captain contrived to smuggle two of the poor wretches on board the vessel, with whom he sailed. When complainant was put on shore, the natives all surrounded him, and seemed lost in wonder as they examined his dress, and the colour of his skin, as they had never seen a white man on the island before. He was stripped of his clothes, which the natives tore into numberless pieces, and divided amongst themselves, and afterwards exercised their agility by dancing in a very grotesque manner around him. Rinkle remained on this island nine months, and, upon the whole, lived pretty well among the savages. Their principal food was cocoa-nuts and fish. On two or three occasions the natives suffered much from a scarcity of food. They were not cannibals, but, thinking he might have a taste for human flesh, they once offered him a portion of the bodies of a woman and child who had died suddenly. He refused the proffered food with disgust, and made the natives to understand that white men never ate human flesh. They appeared much surprised at this, and asked why the captain of the big canoe should take away two of their countrymen. He had been on this island about nine months or moons, when one day he perceived a ship in the offing, and made signals of distress, which to his great joy were perceived,

and the ship hove to. A boat was sent ashore to receive him, but the savages endeavoured to prevent him leaving the island. He, however, managed to swim to the boat amidst a shower of arrows, and was safely taken up by the crew. The vessel turned out to be the Clementina, a schooner, bound to Batavia. The captain was a Frenchman, but the rest of the crew were Malays. During the voyage the Malay crew murdered the captain and mate, and seemed inclined to murder him, but they changed their minds, and put him ashore on Ascension Island, where he found five Europeans. Shortly afterwards, a launch or boat which had been dropped from an American ship drifted on shore. In this frail bark they went out to sea, and after suffering very great privation, and being buffeted about for four months, they reached the Sandwich Islands. They were taken on board the Mable schooner, and afterwards transferred on board her Majesty's sloop of war Imogene, in which they reached this country. He had been away for seven years, and had endured very great privations and sufferings. His friends had long since thought him dead, and great was their surprise and joy when he presented himself amongst them."

A respectable person gave testimony to the creditworthiness of this strange history, and some steps were ordered by the magistrate to be taken for the redress of the very great hardships suffered by Rinkle.

LAMARTINE'S FAREWELL TO FRANCE, ON EMBARKING AT MARSEILLES FOR THE HOLY LAND.

[From the new translation of Lamartine's Journey in the Holy Land, published in the series entitled "People's Editions." The translation of the following verses, as of all the other verses in this new edition of Lamartine, was executed by Mr Thomas Smibert, of Edinburgh.]

If to yon swift bark's canvass I confide
Each blessing Heaven has willed it to impart;
If I commit to ocean's fickle tide
A wife and child, twin portions of my heart;
If I expose to sand-bank, surge, and blast,
Such hopes as these, so many beating breasts,
And with no gage of safety, save a mast
That quivers when the south-wind lists;

'Tis not that lust of gold inflames a soul
Which to itself hath nobler treasures made;
Nor that I thirst in glory's flaming scroll
To write my name—if written, soon to fade;
'Tis not that like to Dante's is my fate,
The bitter salt of exile doomed to taste;
Nor that inconsistent faction's angry hate
Hath laid my parent root-tree waste.

No, no! I leave upon a valley's side,
And weep to leave, green fields and shade-fraught trees—
A home where sweet remembrances abide,
Which many a kind eye blesses when it sees;
Screen'd by the woods, I have secure retreats,
Where never factious brawls the calm destroy,
Where, 'stead of civil tempests, nothing meets
My ear but thankfulness and joy.

An aged sire, girt by our imag'd forms,
Starts if around the walls the winds but sigh,
And daily prays that he who rules the storms
May not beyond its strength our canvass try;
Workmen and servants, masterless each one,
Trace on the turf our steps with sad acclaim,
And, basking 'neath my window in the sun,
My dogs whine as they hear my name.

Sisters I have, nursed at the same kind breast,
Boughs on the same trunk cradled by the gale;
Friends, too, whose souls my spirit has possess'd,
Who read my eye, and can my thoughts unveil;
And hearts unknown are by the muse made mine—
Friends who hold converse with my poesies—
Echoes unseen, who round my path combine
To pour responsive harmonies!

Yet souls have instincts hard to be defined,
Like that which prompts some hardy birds to roam
In quest of nurture of another kind,
And cross at one bold flight the deep sea foam.
What seek they in the regions of the East?
Have they not mossy homes beneath our caves?
And store of food their little ones to feast,
When autumn shakes our sun-tipt sheaves?

I have like them the bread each day requires,
Like them I have the river and the hill;
Most humble is the range of my desires,
Yet I like them am coming, going still!
The East, like them, some power now bids me trace,
For never have I seen or touched the land
Of Cham, the first dominion of our race,
Where man's heart felt God's kneading hand.

I have not sailed across the sandy sea,
To the slow rocking of the desert ship;
At Hebron's well, beside the palm-trees three,
I have not wet at eve my yearning lip;
My cloak beneath the tents I have not spread,
Slept in the dust which strewed Job's brow of yore,
Nor dreamt by night, with moaning sails o'erhead,
The dreams which Jacob dreamt before.

Of earth's seven pages one yet waits my eye,
I know not how the stars may keep their sphere—
'Neath what ideal weight the lungs may ply—
How palpitates the heart—when gods are near!
I know not, when the grand old columns throw
On the bard's head the shadows of the past,
How herbs may speak, or if earth murmurs low,
Or sadly weeps the passing blast.

I have not heard the nations' cries ascend,
And call responses from the cedars old,
Nor seen high Lebanon's God-sent eagles bend
Their flight on Tyre—emblems of wrath foretold;

My head I have not laid upon the mounds
Whence all of Tadmor but the name is gone,
Nor have my lonely footsteps woke the sounds
That sleep round Memnon's vacant throne.

I have not heard the mournful Jordan pour
Low murmurings from its abysmal caves,
Weeping sublimer tears than those of yore,
With which sad Jeremiah chilled its waves
I have not heard the soul within me sing
In that resounding grot, where, 'mid the night,
The bard-king's trembling fingers swept the string
Led by the hand of fiery light.

I have not traced the prints around that spot,
Where, 'neath the olive, Jesus weeping lay,
Nor on the straggling roots the tears have sought,
Which eager angels could not kiss away;
By night I have not in that garden watched,
Where, while the sweat of blood was undergone,
The echo of our griefs and sins unmatched,
Resounded in one heart alone.

To that dear dust I have not bowed my head,
Which was by Christ's departing foot impressed,
Nor kissed the stones in which his mother laid
His tear-embalm'd remains of earth to rest;
Nor have I bent my bosom in the place,
Where, conquering the future by his death,
He stretched his arms all mankind to embrace,
And blest them with his latest breath.

For these things I depart—on these bestow
The span of worthless days yet left for me.
What boots it where the winter winds lay low
The barren trunk, the withered shadeless tree?
"Madman!" the crowd exclaims, itself unwise!
All do not find their food on every road—
The pilgrim-poet's food in thinking lies:
His heart lives on the works of God!

Adieu, my aged sire, and sisters dear!
My white and walnut-shaded home, adieu!
Farewell, my steeds, now idling all the year!
My lonely, hearth-couch'd dogs, farewell to you!
Each innage grieves, and haunts me like the ghost
Of bliss departed, that would stay me fain:
Ah, may our reuniting hour be crost
By no like shades of doubt and pain!

And thou, my land, more vexed by surge and blast
Than the frail bark which now my all conveys,
Land, on whose fate the hopes of earth are cast,
Adieu! thy shores now fly my dimming gaze!
Oh, may a ray of heaven dispel the gloom
Which wraps thy freedom, temples, throne, and thee,
And all thy sacred borders re-illumine
With light of immortality!

And thou, Marseilles, that at the gates of France
Sittest as if to hail each coming guest,
Whose port smiles o'er these seas, with hope-bright glance
And seems for winged barks an eagle nest;
Where kindly hands yet feel the clasp of mine,
Where yet my feet half cling in fond sojourn,
Thine be my parting prayer, Marseilles, and thine
My first salute on my return!

THE WONDERS OF HORTICULTURE.

Innumerable are the advantages which mankind have derived from the horticulturists. Few would suppose that the peach (from which branched the nectarine) had its origin in the almond; or that the shaddock, the citron, the orange, and the lemon, proceeded from the diminutive wild lime. That favourite edible, celery, springs from a rank and acid root denominated smallage, which grows on all sides of ditches, and in the neighbourhood of the sea. The hazel-nut was the ancestor of the filbert and the cubnut, while the luscious plum can claim no higher source than the sloe. From the sour crab issues the golden pippin, and the pear and cherry originally grew in the forest. The garden asparagus, which grows, though not very commonly, in stony and gravelly situations near the sea, when growing spontaneously, is a diminutive plant, and none indeed but a practised eye, examining into the species which is reared by artificial culture, can discern the least resemblance. Wondrous to relate, the cauliflower, of which broccoli is a sub-variety, derives, together with the cabbage, from the colewort; a plant in its natural state, and scanty leaves, not weighing half an ounce. The Crambe Maritima, which is found wild adjacent to the sea, has been improved into sea-kale; the invaluable potato is the offspring of a bitter American root of spontaneous growth; and the all-tempting pine-apple descends from a fruit which in foreign climates grows wild by the sides of rivulets, and under the shade of lofty trees.—*Gardener's Gazette.*

NEW INVENTIONS.

It is no slight evidence of the inventive spirit of the age, that, almost at the same time, three apparently important discoveries in the departments of the fine arts should be made in Paris, Petersburg, and Berlin. While Daguerre, in Paris, found out how to produce the most accurate copies of objects in a chemical way, by means of the action of light; while Jacobi, in Petersburg, transformed, by a galvanic process, engravings on copper into works of relief, without destroying the former—an invention, by means of which it is possible to multiply, in a mechanical way, oil-paintings, with all their brilliancy of colours, and that with a fidelity hitherto unattainable, is approaching to perfection at Berlin; the inventor, Jacob Leipmann, has been led by his studies of colouring, and the mixing of colours, to the idea on which he has been already engaged ten years, till he has recently been enabled to accomplish the difficult object which he proposed to himself.—*Foreign Monthly Review.*

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

THE FOLLOWER OF THE FAMILY.

PART THE THIRD.*

"GONE!—did you say gone!—really gone!"—were the frequently repeated exclamations of an Irishwoman at the door of the *then* fashionable hotel in Bond Street. "Gone! for good and all!—gone intirely! Ah, thin, for the love of God, tell me when he went, and where he's gone to."

"Take your Irish howl out of this," answered a fat waiter; "we don't want rebels here."

"I don't care what you call me *now*," said the poor woman; "but from this I will not stir, until I hear some news of my Masther Garrett."

"What does she say?" inquired half a dozen voices at once.

"Don't make game of her," interrupted a respectable-looking servant out of livery. "Don't you see the poor woman's in tears?"

"Ah, thin, sir, good luck to ye; ye've a *live* heart in yer bosom. And can ye tell me any thing at all of the young gentleman, Masther Garrett O'Dwyer?"

"If you mean Mr O'Dwyer who was here with a foreign count yesterday, he is gone."

"To where, sir?"

"That, my good woman, I cannot tell you; but I believe it was time he went."

"Quite," added the first speaker, significantly.

"You do not mean to say he did any thing to disgrace his name?" inquired Margaret, looking round her proudly.

"Oh no!—only fine feathers make fine birds. He's bound up part and parcel with the Romish powers abroad—the Pope himself, or maybe Bonaparte; he liked to read the Irish papers; and I can't think what our government is about, to let foreigners of any country among us, eating our roast beef and plum pudding: it's unconstitutional. Keep them out, I say—keep them out;" and the fat waiter flourished his napkin, and passed, with a consequential air, from the conference.

"If I had only seen him for one minute!" exclaimed the poor nurse; "just heard his voice—got one word of speaking with him! Oh, sir, sir, are you sure he's gone?"

"As fast as four posters could take him."

"And where'll I get his direction, will you be pleased to tell me?" inquired the nurse, with admirable simplicity.

"That I really do not know. There are persons about, who say that he was obliged to quit by an order from government."

"See that now!" said Margaret, while a species of pride, purely Irish, lit up her face; "see that now! Bedad, then, it's little trouble the government would take about him, if he wasn't a person of consequence."

The man smiled, and the follower of the family, after a few more useless inquiries, turned away to tell her troubles to "the doctor," and indulge in the belief that it must have been *her* Garrett O'Dwyer, "who

had given, like many of his name, a power of trouble to the great English government."

Imagine every thing that was affectionate in Margaret's conduct towards Evelyn, during the time she was subjected to the oculist's experiments—imagine the hours of tender watchfulness—imagine the days of intense and often *hard* labour—imagine, amid it all, the deep anxiety with which her heart yearned for news of her brother and his family—imagine her unsparing, unceasing care—imagine a hundredfold more than I can tell of the privations she endured, and above all, the torturing suspense as to whether or not her darling would or would not receive the blessing of sight; and then picture, if you can, her perfect and entire satisfaction at finding the grand object of her life realised—the child of her affections gifted, as it were, with sight—restored to that unspeakable blessing—the eyes of the young patient, now full of meaning, beaming upon her in the full lustre of youth and love—questioning, as it were, her features, and then forcing her to speak, that she might hear she was not deceived, and that it was really her own, *own* nurse she looked upon. Days and days, and weeks and weeks, of prayer and almost speechless anxiety, passed before this long-looked-for end was accomplished. And when Margaret's high and grateful spirit had sufficiently rejoiced therein—when her heart had, as it were, in some degree emptied itself of rejoicing, the care for the future made her continually exclaim, in her own mind, "Ah, thin, it isn't ungrateful I am to the Almighty God for restoring her, the delight of my soul! to the sight of her blessed eyes! But my heart aches to hear news of home: if we go back, they say we'll be murdered: the trouble is in the country still, and sure that's no news. And if I could only hear from my brother, and of Masther Garrett, why, Margaret Sheil, you'd be a happy woman. But I must wait, God help me, patiently. The doctor (God be good to him!) says he has some news in store for me. I must own this is a beautiful country for earning money; only, the worst of it is, it goes as fast, not to say faster than it comes. If I had only time to make myself known to Masther Garrett, that he might have carried with him the knowledge that his child was well and living, it would have comforted him when far far away from the sound of his natural language!"

Margaret Sheil little knew how the cares, the ambitions, the projects, of this busy world, sap and undermine the finest and best affections of our nature. We imagine that our feelings of love and tenderness for our kind remain the same. We fancy that years roll on, and find us, when we do pause, exactly what we were. Alas! no fallacy is greater than this. The springs of love have become choked by the foul weeds of worldliness. The selfishness of self, that cheerless, gross, and impotent enjoyment, that gnaws and grows over the vitals of all social duties, and would fain sever all social ties, has fixed its fangs upon us. Thrice blessed are we if we escape!

Garrett O'Dwyer had been compelled to abandon his child and the stiffened corse of his mother on that well-remembered night, from finding that his connection with the disturbers of his country was discovered by those who would have been glad to see him sacrificed; for, young as he was, there was a wild and fiery zeal about him, which promised much that was daring: in the great game of life he had every thing to gain, and nothing to lose.

From what I have already said, no one will imagine Garrett O'Dwyer one of those who would labour patiently and earnestly in a homely or even exalted calling: he would trust all to a *coup de grace*; and if that failed, lose all power of exertion until something

else was struck, like fire from flint, to arouse his energies. The frame, hardened in youth by mountain pastime, is not likely to shrink from personal exertion when acts of daring are necessary to effect an object; and the mind takes its bent from the habit of body, when it has not been directed to any particular exercise calculated to call forth its thinking rather than its feeling powers. One or two successful strokes of fortune threw Garrett O'Dwyer, in his foreign exile, amongst those who saw at that time enough in the character of the Irish disturbances to stimulate their own ambition. He did not depart without some "mystic lines," signifying his ancient descent and his future desires. He was the very fellow to rise in foreign service; and those were times when the soldier of yesterday was the general of to-day. Garrett had abundance of fierce courage; he was brave, earnest, gay, fond of pleasure, cunning, and gifted with rare powers of pleasing. When first he crossed the sea that separated him from his all—his child—he felt as every young Irishman would—most keenly. On the night of his departure, he tore a tuft of fern from the crumbling walls of his ancestral home, and, placing it next his heart, swore, in presence of the silent stars, that he would return and win back those halls to be his own. He passed the lonely and deserted graveyard, where the dock and the seedy nettle triumphed over

"The Blakes and O'Donnells"

of bygone years; he threw himself into the long strong grass that waved in the night-wind over the remains of his careless father; and when his overwrought feelings found relief in violent tears, he repeated on his knees the few prayers taught him by his mother and Margaret, and, with a heart full of wild yet generous and ennobling sympathies, the last of the name departed from his "Fatherland."

With a new country, came new excitements. For the first year he was, as Irishmen generally appear during the first year of exile, a red-hot patriot: he talked, and, to do him justice, *felt*, strongly for his country. But he had entered foreign service; and the remembrance of Erin, of his indulgent mother, his once madly loved Moyra, his infant daughter, became rubbed out, as it were, by the friction of stirring events. At first he had wished that the child might live, "to be the comfort of his declining years;" then, as he grew older and more prosperous, he never thought he could decline; and at last he arrived, somehow or other, at the conclusion, that, deprived of maternal nutriment, the child must have died. Those who have not watched the rise, progress, and decay of human feelings, will be inclined to call Garrett O'Dwyer—a monster; those who have, will call him—a man!

Years rolled on, bringing prosperity on their wings; and it was no wonder that Garrett O'Dwyer was spoiled like the rooster of his sex, whose strength and beauty is rather of the body than the mind. No wonder that Garrett was greatly injured by admiration and success. How much would poor Margaret have been disappointed—disappointed, though perhaps proud, to find "Masther Garrett" a brave officer, in the confidence of the official whom he accompanied to England!—a soldier, polished as much as a soldier ought to be—a man of much penetration and brilliancy of character, but lacking those natural affections which may be considered the core of an Irish heart—irresistibly drawn by some long-dormant sympathies to the details of the fatal turmoil of ninety-eight, he read, as the waiter had stated, the Irish papers with avidity; he could not look over the progress of the disturbances amongst his native mountains, without longing to join in the strife he was once sworn to.

* Through unforeseen circumstances, an interval of a fortnight has been allowed to elapse since the second part of "The Follower of the Family" made its appearance. It may not be superfluous to mention that, in the earlier parts of the tale, Margaret Sheil, a faithful adherent of a decayed Irish family named O'Dwyer, has come to London, for the purpose of submitting to the care of an oculist of reputation, a poor blind girl, the daughter of the last O'Dwyer, who, immediately after her birth, had left his native country, and was not afterwards heard of till it was ascertained (at the end of the second part of the tale) that he had been for a few days at a hotel in the metropolis.—Ed.

Still, it was not the policy of his adopted country to interfere at that time; and the morning that his faithful nurse had sought him, he had promptly departed, for reasons unconnected with Ireland, and with which my tale of Margaret's fidelity has nothing to do.

The news that, according to Margaret's phraseology, the doctor "had" for her was certainly romantic: a lady wished to adopt little Evelyn, on certain conditions, which Margaret was to hear from herself; and, accordingly, at the appointed time, she took the child to one of the old suburban houses, and soon found herself in the presence of an elderly gentlewoman, who had frequently passed her when she waited in the hall of the benevolent oculist. Evelyn was not present at the meeting, but left in another room. Her nurse related the little girl's history, suppressing only her belief that her father had been so recently in London, from a cunning peculiarly Irish, which whispered, that the lady might not be so ready to do her service if she thought it probable that her father ever would return. The lady's name was Langham. Bereaved of her own children, she had long struggled with that loneliness of heart which is always a bitter trial for woman to endure: she believed this friendless girl would be something whereon she could expend her affection and her benevolence; and after enumerating, rather ostentatiously, the benefits she proposed to confer on Evelyn O'Dwyer, she added—

"You perceive I remove the burthen of the child from you altogether; I adopt her as my own; and I think it would be better if you were not to see her at all; if she were to see you constantly, it would recall her old feelings and associations."

The Irish nurse looked for a moment abstracted and confused; the possibility of her being denied access to Evelyn, had never before occurred to her. So astounded was she by Mrs Langham's words, that she suffered her to enlarge upon the benefits that would arise from this sacrifice, which she considered in that one-sided way which people are apt to do when chiefly thinking of their own feelings. At last, moving steadily towards the lady, she fixed her piercing eyes upon her, and said, simply and honestly, but in a tone of the deepest pathos—

"Ah, thin, ma'am, is it for parting us ye'd be?"

"You must understand, my good woman, that I want to bring her up with the feelings and manners of a gentlewoman."

"I wish that the Almighty would but give ye the power to look into the heart of that blessed child, and there ye'd see, my lady, stamped upon her very soul, the honour, the feelings, ay, and the pride too, that belong to a gentlewoman—yes, and though the world don't think it, to many not born so. I had her, before she was twenty-four hours, a weeping babe of a weeping land. I promised her father to protect her—I kept my oath to him, and God. I have watched over her, prayed for her, that had no sin, instead of trying to lessen my own heavy load of that same, God help me!—kept all knowledge of bad from her, because I wanted her to be like the angels in heart as well as in body. I have done all this, and more: I would not marry where my own wake woman's heart had settled for years, because of the duty I owed the family. When I saw a chance of restoring her precious sight, I left name and home, kith and kin, and country, to see justice done to her. I have loved her and honoured her. Never let her think me her equal, but her servant. And now you would turn me from her! Ah, thin, lady dear, I heard tell on't of a bird that laid eggs of gold; I'm not going to say what sort of a bird she was—but gold they war for certain, as I heard tell—full of gold. But, sure, she had no sooner laid the egg than she trampled it under her foot to nothing. If the egg had not been spoilt, my lady, it would have been worth any thing. But what good was it?—spoiled and destroyed entirely. Ah, ma'am, it's a pity to mar what's made, as the thunderbolt said when it thought of the oak it had riven, just to show its strength."

Now, the lady liked the child, and there certainly was much kindness in her heart; but it is not every one who can distinguish the difference between rusticity and vulgarity. A woman of such self-sacrificing and disinterested feelings as Margaret, could not, no matter how poor or low-born she might be, communicate mean or paltry feelings to others, because they never had place in her own bosom—they were not inherent in her nature. But Mrs Langham, like too many others, had acquired the habit of considering poverty and vice as synonymous; and (for that she had a heart both sound and healthful), albeit somewhat encrusted by prejudice and the opinions of the world, which good people often adopt and believe their own, she felt the natural eloquence and power of Margaret's appeal: it was new, and apt; and, above all, it came fully and freshly from her heart. But the lady thought she would try her a little further; her arguments, however, were feeble, for NATURE was against them. The follower of the family had been father, mother, home, country, all, to the child, which was in reality the creature of her bounty, but which she believed it was her duty not only to serve, but to slave for, to the end of her days.

"It's no good, my lady—God bless you, you mean it all for the best—I see the advantage, madam—let her live with you; I'll not stand in her light for that—let her be to you as your own child; your goodness will have earned that duty from her—tache hor, my lady (not that she's ignorant) all kinds of things (only

her eyes, God help her, are still wakely, and don't let them be worn out)—let her be yours, heart and soul. I never thought her love could keep the same for me, when she got among her own class like. I learnt that lesson long ago of a little King Charles's puppy that my poor mistress had (the heavens be her bed!) that when on't it was fully reared by a turnspit baste that let it share the milk of her own pup, turned away from the kitchen to the parlour, and would even set its teeth and grin at the poor ould brute that sometimes thrust its nose into the company quarters, out of good nature to look after it. Mine will never do that," she added, wiping her eyes. "But I'm deeply grateful she should keep with those who can put her in her own station; and I'll be no burthen on them or her. I'll earn my own living, as I do now. But to say that I'm not to give her to her father, if I should ever find him—to say I'm not to see her of a Sunday—that I'm not to watch the light increasing in her eyes, that, through God and his agents, I undoubted—not sometimes to hear the voice that's the only music my heart danced to for years!"—She could not continue, but turned away her face and wept bitterly. Mrs Langham, too, felt more than she acknowledged. "I have only spoken of myself," said Margaret at last, "but let Miss Evelyn spake for herself."

She opened the door and called: the little girl bounded in like a fawn, and then paused to look shyly around at the fine pictures and rich things, and, above all, at an exquisite painting of the Virgin with the infant Christ, which Mrs Langham, being a Roman Catholic, treasured for a double reason. The light fell from the window upon her beautiful head, and before Margaret spoke, she turned with a smile towards "the lady"—a smile of admiration which was returned.

"Evelyn—Miss Evelyn, avourneen, do ye see that good lady, that has often spoke kind to ye, darlint?"

"I do."

"Could ye love her, a-cushla?"

"Ah, then, I could—I do, nurse!"

"Maybe as well as me?"

The child's laugh was momentary music, but it was a laugh of derision—and she twined her nurse's arm round her neck.

"But you'd try, darlint! She's a good lady—quite a lady, my bird alone!"

"And so am I," said the little O'Dwyer.

Mrs Langham observed her proud look; it augured well for her project. The nurse continued—

"Avourneen, this lady is very kind, very good; she wishes to take you to be her child, to tache you to play the fine music, and behave like a lady, and live in this beautiful room, and drive in a coach!"

"Live in this room! drive in a coach! play music!" repeated the child in ecstasy, her bashfulness conquered by delight. "Oh! We shall be so happy!"

"Not we, avourneen, but you."

"Shan't you like it? Oh, dear nurse, you can't mean not to like it!"

"But you are to leave me—not to see me any more—all these beautiful things to be yours to live among—but no mammy nurse."

"Let us go," said the child, seizing her nurse's hand between both hers, and rushing to the door; "let us go; this is a bad place to stay in!"

It is almost needless to say that nature triumphed. Margaret positively refused to become an inmate of Mrs Langham's house, but laboured in various humble callings, repaid most richly for her self-denial by the continued affection and improvement of Evelyn O'Dwyer. Nor did her energies or affections slumber over one object. Her inquiries respecting Garrett were continually renewed, though continually unsuccessful. At length her curiosity as to the fate of her brother's family was wrought almost to insanity by a letter from the priest of her parish, written several months after the troubled waters of the rebellion had been quelled for the time being.

"The place is changed for the bad entirely," he wrote. "Margaret, my poor woman, yer brother and the little girls are not in it now; he was drawn in, with more of the boys, to the plot of the Scrimmage; and when the game was up, why, a parcel of them gathered what they could, and left for the New World: there's not the shadow of a Sheil upon their own mountains now. News has come of their safe and happy landing—God be praised for that same! And to be sure, by all accounts, it's a fine place; but the parish is lonely without the faces of them I christened, whose arms I hoped would have borne their ould priest to his grave. The last word he said to me was, 'Father Mullins,' says he, 'when you get the opportunity, tell her, my sister Margaret, that luck and her left us together; but say that my blessing is with her and Miss Evelyn, day and night. Born and brought up for more than three hundred years under the lords of the soil, the natural heritors, the grate O'Dwyers!—she did her duty in doing her best for poor Master Garrett's child. It was hard to part with my sister, the woman that had both head and heart!—but she did her duty, according to the good ould fashion which lost our great-great-grandfather his life with great glory, and put his name and part of his effigy upon the tombstone of the ould lord in the abbey church, whose grey towers and green ivy is to the fore among the hills of ould Ireland still!—a thought that will rise up our hearts among strangers, and make us think of ourselves, and what our people were before us, when we're in the land of strangers. You'll soon know where I'll be,

Father Mullins,' says he; 'and if the blessed Evelyn gets her sight—or if she does not, it's all one, as far as I'm concerned; and it'll go very hard with me if I can't make out a home for her—and a welcome, and me and mine proud to sarve her—as becomes the followers of the family.'"

The letter contained more local news, and the name of him whom that poor faithful woman had loved during her life—loved, though forsaken, because she would not trust to any beyond her "own people" the fealty which she conceived due to an O'Dwyer.

My picture is not too highly coloured. The intensity of affection, the most intense of all the passions of woman, was in this instance united to the clannish pride which in those days was more universal than it is now. We are growing too wise to love without receiving some advantage in return—we must inquire why and know wherefore. Among the far mountains, by the sides of the distant lakes, and in the bosoms of the deep valleys, there are still such to be met with: but never was there one more faithful than Margaret Sheil. Still, she had many heart-yearnings after her own people and her own land. She was established in what she called "the way of trade," at the corner of Cheyne Walk, Chelsea. Mrs Langham lived in one of those stately old mansions facing the Thames; and Margaret, after much patient endurance, adding penny to penny, had taken a little room in one of those poor houses, that, as in the Italian towns, crouch at the curb-stones of right noble dwellings. This room opened below the pavement, but its window was a little above it; and at this window might be seen a dozen at least of good oranges; three or four lemons laid along the inner ledge, flanked on either side with pottles either empty or full of strawberries; cherries tied in "hap'orths" on a peeled sally-stick; sundry cabbage and lettuce plants; long red radishes and little nubby white ones; interspersed with gingerbread, and the nameless sundries of a small green-grocer, in a small way; while within, Margaret, over active and ever clean, washed, or starched, or knitted, or did any and every thing in the world that she could get to do. This industry had its reward: she saw "Miss Evelyn" walk past with Mrs Langham, to enjoy beneath those old trees the breeze from the river; and she never did pass without leaving her friend for a moment, to fling her arms round Margaret's neck, call her "dear darling mammy nurse," and whisper any little bit of half-childish half-girlish news that she thought would please her. Margaret perceived that "the lady" was somewhat jealous of this love, but she had the good sense not to mind it. She saw her darling in the enjoyment of positive good—she knew she loved her—she went to see her occasionally in the fine house, and was sometimes, on a Sunday evening, when Mrs Langham took her afternoon nap, permitted to walk with her in the long, stiff, stately garden at the back of the house; and there she could talk of Ireland, the name of which set her young heart beating.

"Love it, my darlint, love it ever! But my woe is, avourneen, that you war dark when you war in it, and can't tell the differ betwixt the two countries. The first time ye saw (to remember) the blessed light, was in the doctor's study; he's a fine man, to be sure, and a good one, God bless him! but his house had a quare look. Och hone! if you had but seen how green the grass is, and how blue the mountains, and how clear the sky, I'd be satisfied. But, Evelyn, darlint, I have no right to be saying 'satisfied' such a ould word, after the grate blessing the Almighty poured upon you—that's what I ought to think of, and you too, a-lanna-machree! And the blessein' that always followed ye, poor, weeping, dawshy craythur that ye war, the first time ye war given as new sight to my own eyes! Oh, thin, but the ways of the Almighty are wonderful by sea and land! Oh, thin, dear! as ye could not see, does yer mind ever turn to the sounds of yer own country?"

"Yes," replied the girl; "oh yes! Often I sit under that ould mulberry tree, and look through its leaves up to the sky; but the music of the lark does not come falling upon my eyes from the clouds, as I used to fancy it did when we were at home and I was blind. Do you mind, mammy nurse, how I used to know the birds by their notes; and do you remember how I followed the whistle of the plover?"

"Do I!—oh, but you war the weary child without any fear! And how we all looked after ye, and no good, until I found ye asleep on the very edge of a bog-hole, that would have swallowed ould Cromwell and all his troopers, if he had only had the luck to fall into it! There ye war, laughing in the sun's face, and ye asleep, and one turn would have finished ye! My brother (he had great faith in such things) said it was the slip of hazel ye held in yer hand that saved ye. But I always thought the Almighty puts his two eyes in care over the blind."

"Nurse, whenever Mrs Langham gives me praise, then I wish my father heard it!"

"The Lord will give ye yer heart's wish yet, a chora machree—trust in him. Sure, though I never thought to see Master Garrett's child dependent on any one, still, sure it's wonderful entirely the luck ye've had: it's like an ould story, so it is."

"And all through you, dear mammy nurse; through you!" said Evelyn—and she said truly.

Margaret never suffered more than three months to elapse without making inquiry at the oculist's if

*Remember.

news had been heard of "Masther Garrett," so steady was she in this matter, that "as persevering as Margaret Sheil" passed into a proverb, and the little old Irishwoman—old, as she was called by the very young of the family—was a constant querist on the usual subject.

At last came the peace—frail, as it turned out to be—of 1802. Margaret's regular habits became confused; she absolutely confounded apples with pears, and two of her neighbours complained that her eggs were musty. She did nothing but borrow and read newspapers, write letters, and, instead of being satisfied with a quarterly visit to the oculist, visited him twice, or at least once, a week. She was seen more frequently hovering round the Bond Street hotels than returning from Covent-Garden market with her "greenery," and truly the gossips thought Margaret was taking leave of her senses. With her usual wisdom and kindness, she did not suggest to Evelyn the possibility of her father visiting England at this period, though it was the engrossing feeling of her own existence. She could not rest by day, nor sleep at night, for the thought that "Masther Garrett's" voice sounded in her ear, exclaiming, "Margaret, where is my child?" The oculist, proud of "Evelyn's eyes," admiring the admirable fidelity of the Irish nurse, and constantly applied to by her for news of "Masther Garrett," was himself stirred up to make inquiries that otherwise he would not have thought of. But though foreigners poured into England almost as rapidly as English poured out of it, still "he came not." Each morning Margaret arose with hope, each night sickened with despair. Yet still she wandered in and about the city, peering into every carriage that passed, and inquiring at the hotels, where her rebuffs were many, "what strangers had arrived in town?" No peasant in the world bears a rebuff so well as an Irish one, even if the sting enters their heart; and that they feel it, the quick blood mantling to their cheek is sure to tell. Still, they either take it meekly, or wing it back to the giver, armed either with a jest or a blessing. The Irish nurse was too earnest to jest, nor was she ever profuse of words, so she took the rebukes meekly, as she never failed to repeat the offence in a day or two. The loungers about the hotel doors were sure to be addressed with, "I humbly ax yer pardon, but is there such a one here as a gentleman, one Mr, or, it may be, Captain, Colonel, or Count Garrett O'Dwyer?"

"Are you his mother?"

"Is it me!—oh, wisha, no!—nothing but a follower of the family, that wants to hear tell of him."

"Why, you asked here last week."

"Sure I know I did, sir; he wasn't in it then; the more reason he'd be in it now."

"Go to the d—!—there's no such person here."

"Thank ye, sir. I'll waste the liberty to come again in a day or two."

"You need not trouble yourself."

"No trouble in life, sir, thanking you for your consideration; and if it was, I shouldn't find it so. Good morning, sir." And she would turn her patient face towards another hotel, to meet with, it might be, even a more rough reception.

One evening Margaret returned weary and dispirited. The few customers her industry and attention had secured, had fallen off, for she was not at home to attend to their small wants. Her oranges had grown rigid, and her lemons mouldy; she turned them over, sighed, and sat down to look out upon the noble Thames, that glided on, a sheet of molten gold, for the sun was setting in all its glory. She peeped through the trunks of the tall trees, and thought how black and harsh the wooden arches, and crosses, and beams of the old bridge looked; and then the splash of oars from a very gay wherry that was nearing the landing, smote upon her ear; and then the strains of a song, certainly not English, which was concluded by a laughing sort of chorus; and that, as the gay boat was moored at the landing, was followed by what seemed a half-English, half-foreign conversation. This aroused Margaret, and, fatigued as she was, she went out, "just," as she often said in after-times, "to see if any of them might be Masther Garrett." They had left their boat to inspect the coffee-house rendered so famous by the wits of a past age, the famous Don Saltero's, which has "degenerated" in the present day, but still exists; and Margaret, having satisfied her curiosity, was about to turn away, when the accent of one of the gentlemen, a tall, florid, mustachioed man, fixed her to the spot. A residence abroad seems to rivet an Irishman's brogue, and certainly his was ripe and racy.

"It's beautiful, certainly," he said, with reference to the river; "but, somehow, I always miss the mountains. I suppose it is from being used to them when I was a boy."

"And then?" exclaimed Margaret, rushing forward more like a maniac than a sane woman, and completely losing the gentle, staid manner for which she was so remarkable, and speaking with fearful rapidity: "and then ye think of the Shine-brui, the Gra-na-groul, the—the—but no, no—Masther Garrett, arick—ye think—ye do—I know it's yourself that's in it—yer mother's smile—the eyes of yer poor father—the heavens be his bed!—Ye think—OF THAT NIGHT—yer dead wife—the curse of yer mother—of the child—the babe—the jewel—that ye left in the heart of Margaret Sheil—ye—you—oh God! I shall die—before I give her back!" And, utterly overthrown by the outbreak of

those feelings which had been cherished, and treasured, and concealed for years, the follower of the family sank at the feet of Garrett O'Dwyer.

The scene was so startling that the cheerful party became silent. Nature tugged at the soldier's heart. He would not, if he could, refute her statement. All the past, which had been but the dream of his boyhood, came back upon him; and man of the world though he was, he leant against a tree, totally overpowered, while others saw to and revived poor Margaret. No feeling of ridicule could be attached to the scene: it was too strong, too earnest, for any thing but sympathy. Startling and improbable as it sounded, no one who heard doubted its perfect truth. With the instinctive delicacy, I will not say of refined minds, but of human nature, his companions retreated; when Margaret, restored to herself, was enabled to suppress her emotion, and mutter to herself, while holding "Masther Garrett's" hand within her own,

"It's no drame—I'm awake—my eyes are open—God bless us! the marcy of the Lord is great! But ye must come with me—I cannot tell ye here;" and never casting a thought upon the rank and station of the exiled but prosperous Irishman, she clung to while she conducted him to her humble home. And there, without imagining for a moment that she was recording a tale of as great and exalted faithfulness as was ever performed by woman, she told her history, and the history of Evelyn O'Dwyer.

How was it, that, even while she spoke, the impulse of that man's heart beat slower, and more slow—that a record, which, when first I heard it, moved even me to tears, fell upon the father's heart rather as a tale of sorrow than of joy!—how, that, instead of the yearnings of a father's soul towards his child, sprang up the selfish calculation of what he should do with her?—of what Madame O'Dwyer, his young, rich, and imperious wife, would say on his return abroad, to a young and beautiful rival in the shape of his daughter? Nay, if she were only a third part as beautiful as described by Margaret, what domestic discomfort would it not create!

The follower of the family did not understand the cause of his silence. He was ashamed to confess his thoughts; for we are always ashamed to confess unworthy thoughts in the presence of the virtuous. And the hero of two forlorn hopes, the star of many a brilliant saloon, felt his unworthiness, his moral insignificance, in the presence of that poor, uneducated, but noble-hearted and high-souled woman: his brave, bold eye could not encounter the holy affection, the bright truth, that rendered hers sunny as the first look-out of the unsullied morning.

"And now, Masther Garrett dear," she said, "and now, Masther Garrett, arick machree (but I suppose you've no Irish now), and it's Colonel, or General at last, or may be My Lord, I ought to be calling ye—ye bird of my bosom! come till I give ye back yer own beautiful child, that will be a blessing, and an honour, and a glory to ye! Oh, stay till ye see her!—that's all—and sure I am it will kill the dear kind lady she's with to part with her; for she always said ye'd never come back, sir, but I said ye would—and her eyes, God be thanked! as clear as a kitten's—and will raise yer heart with the tune of St Patrick's Day, played by her long white fingers on the piano! Think of that, Masther—I mean General, dear—And—but sure it's all like a play—I knew the glory would be in the end."

"Stay, Margaret," he said, "I shall of course be delighted to see this girl, my daughter; but—you must be aware, deeply grateful as I am for your fidelity—that—in short—it is rather an awkward business for a young man like me to have a child of that age. The troubles in my poor country—never hearing of you—I thought the child dead; and, in short, I am married, have one child, a boy, and I never told my wife I had been a father."

"Never told her ye were married before!" said Margaret. "Oh, then, honey, why didn't ye? Poor Moyna wasn't your equal till ye made her so; and ye owed respect to the memory of a heart that loved ye to death."

Masther Garrett became confused, but at last replied, "As to the marriage, it was the couple-beggar who—but it was hardly—a—do not look at me so intently, Margaret. You know I was a boy—a mere boy, not more than nineteen—a foolish boy."

"Now, God stop me from saying the word that's struggling in my throat!" exclaimed Margaret Sheil, and her figure appeared to grow into dignity. "You said you war a foolish boy—I had it on my tongue to say a cursed one. But I can't, Masther Garrett, I can't, though you deserve it. Many's the sleep ye had in these arms—I had the last breath of yer mother—almost the first breath of yer child. I cannot say, you are cursed—but, oh! to think of putting a shame on her! Oh, Masther Garrett, it was the could, could world that spoke, and not the descendant of him whom my great-great-grandfather died to save! I see ye didn't mane it—ye—" She paused suddenly, and then added, in a lower tone of voice, "Hush! the Lord is about us—he has a hand in us all! I hear her step coming down the street—I'd hear it among the tramp of forty horses—it wouldn't crush a grasshopper—its light and swift as a swallow's wing! She's here!" And, truly, Evelyn O'Dwyer lifted the latch, and stood a vision of beauty before her astonished father, whom she did not see at first, for the door opened into the room, and he was in some degree concealed behind it.

"Nurse, we want you; I got leave to come for you

myself. How warm it is!" she added, throwing back her bonnet, when her hair fell in rich masses over her shoulders. "Nurse! my mammy nurse! how odd you look! Do speak! Are you ill, darlin' nurse! Have you any bad news? What ails you?"

Margaret flung to the door, and (for she was unable to speak) seized Evelyn's hand, and placed it in her father's; then falling on her knees, she muttered a few inarticulate words of thankfulness to God; adding, as she rose, "That's yer father, Miss Evelyn; his heart is in the hands of the Almighty. Wont ye let me hear ye own her as yer true lawful child? Oh, Masther Garrett, I gained the light of those eyes for ye, that they might beam the child's welcome to her only parent. I gained that blessing for ye, through the help of God! And now I don't ask ye to take her, or provide for her—the Almighty has done that; but I ask ye, in honour to those who look down upon us now, in a strange land, from the blessed gates of heaven—I ask you, to let me hear you own her as your lawful child!"

Garrett O'Dwyer could not resist this appeal; he pressed his weeping daughter to his bosom, and Margaret heard what she desired. Great indeed was her happiness.

The First Consul did not suffer the peace to continue, and Garrett O'Dwyer left England almost as suddenly as he had done before. The follower of the family manifested no regret at his departure. He made her many handsome presents, and gave an abundance of jewels to his child, who remained with the lady that might be considered her adopted mother. A gloomy shadow always passed over Margaret's face when Count O'Dwyer's name was mentioned. One thing was somewhat remarkable:—She refused to marry her old, grey-headed lover, who followed her to London, "because," she said, "there was no telling how a man might change." She never went to her brother, or to Ireland, though she always talked of doing both.

Evelyn is now the mother of many beautiful children; and Margaret, a little, bent, cheerful though rather silent, blue-eyed, old woman, is still—a FOLLOWER OF THE FAMILY.

THE DAGUERROTYPE.

AN account of the new process of light-painting or photography, as far as the subject was then known, appeared four months ago in the present work. Our descriptions chiefly referred to the process followed by Mr Fox Talbot, as explained by him to the Royal Society. The British public had then learned little respecting the process followed in France by the contemporaneous discoverer, M. Daguerre. It was only surmised that the two processes were nearly the same. Since then, we have seen more than one description of the drawings produced by M. Daguerre, from which it would appear that the French process differs from the British, at least in the results, the pictures being very much superior. The following is an account by Sir John Robison, secretary to the Royal Society of Edinburgh, of a visit which he paid to the studio of M. Daguerre: we extract it from the Edinburgh New Philosophical Journal, edited by Professor Jameson.

"* * * Circumstances having led to my being included in a small party of English gentlemen who were lately invited to visit the studio of M. Daguerre, to see the results of his discovery, I had an opportunity of satisfying myself that the pictures produced by his process have no resemblance to any thing which, as far as I know, has yet been produced in this country; and that, excepting in the absence of colour, they are as perfect images of the objects they represent as are those which are seen by reflection from a highly polished surface. The perfection and fidelity of the pictures are such, that, on examining them by microscopic power, details are discovered which are not perceivable to the naked eye in the original objects, but which, when searched for there by the aid of optical instruments, are found in perfect accordance: a crack in plaster, a withered leaf lying on a projecting cornice, or an accumulation of dust in a hollow moulding of a distant building, when they exist in the original, are faithfully copied in these wonderful pictures.

The subjects of most of the numerous specimens which I saw, were views of streets, boulevards, and buildings, with a considerable number of what may be termed interiors with still life; among the latter were various groups made up of plaster-casts and other works of art. It is difficult to express intelligibly a reason for the charm which is felt in beholding these pictures; but I think it must arise, in some measure, from finding that so much of the effect which we attribute to colour, is preserved in the picture, although it consist only in light and shade; these, however, are given with such accuracy, that in consequence of different materials reflecting light differently, it is easy to recognise those of which the different objects in the groups are formed. A work in white marble is at once distinguished from one in plaster-of-Paris, by the translucency of the edges of the one, and the opacity of the other. Among the views of buildings, the following were remarkable: A set of three pictures of the same group of houses, one taken soon after sunrise, one at noon, and one in the evening; in these the change of aspect produced by the variations in the distribution of the light, was exemplified in a way which art could never attain to.

One specimen was remarkable from its showing the progress made by light in producing the picture. A plate having been exposed during thirty seconds to the action of the light, and then removed, the appearance of the view was that of the earliest dawn of day; there was a grey sky, and a few corners of buildings and other objects beginning to be visible through the deep black in which all the rest of the picture was involved.

The absence of figures from the streets, and the perfect way in which the stones of the causeway and the foot-pavements are rendered, is, at first sight, rather puzzling, though a little reflection satisfies one that passing objects do not remain long enough to make any perceptible impression, and that (interfering only for a moment with the light reflected from the road) they do not prevent a nearly accurate picture of it being produced.

Vacillating objects make indistinct pictures: for example, a person getting his boot cleaned by a *decocteur* gave a good picture, except that, having moved his head in speaking to the shoe-black, his hat was out of shape, and the *decocteur's* right arm and brush were represented by a half-tinted blot, through which the foot of the gentleman was partially visible.

There can be no doubt that, when M. Daguerre's process is known to the public, it will be immediately applied to numberless useful purposes, as, by means of it, accurate views of architecture, machinery, &c., may be taken, which, being transferred to copper or to stone, may be disseminated at a cheap rate; and useful books on many subjects may be got up with copious illustrations, which are now too costly to be attainable. Even the fine arts will gain; for the eyes, accustomed to the accuracy of Daguerrotype pictures, will no longer be satisfied with bad drawing, however splendidly it may be coloured. In one department it will give valuable facility. Anatomical and surgical drawings, so difficult to make with the fidelity which it is desirable they should possess, will then be easily produced by a little skill and practice in the disposition of the subjects and of the lights.

It is a curious circumstance that, at the same time that M. Daguerre has made this beautiful and useful discovery in the art of delineation, another Parisian artist has discovered a process by which he makes solid casts in plaster of small animals or other objects, without seams or repairs, and without destroying the model (*Moulage d'une seule pièce, sans couture ni reparation, et avec conservation parfaite du modèle*). I am in possession of several specimens of his work, among which are casts of the hand of an infant of six months, so delicately executed, that the skin shows evident marks of being affected by some slight eruptive disease.

The invention of photography has been brought under the attention of the Chamber of Deputies, who have voted pensions of 6000 francs (L.240) and 4000 francs (L.160) to M. Daguerre and his associate M. Niepce, with a reversion of half the respective amounts to Madame Daguerre and Madame Niepce, in consideration of their throwing open their discovery to general use (a much superior mode, in our opinion, of rewarding inventors, than that of giving them patents, the working of which is always that of a monopoly). The whole process must therefore soon be explained to the public. Meanwhile, we find a few additional points adverted to by a correspondent of the Standard newspaper. A plate of copper, covered with a thin layer of the chloride of silver, and then exposed to as brilliant a light as possible, admitted by an aperture into a dark chamber, through a prism of lenticular shape (the shape of a lens), is, according to this writer, the recipient of the pictures. The expense of each plate is three or four shillings, but one serves for many drawings. A drawing is executed in five minutes in summer and fifteen in winter; and the whole time required for preparing the apparatus and taking the drawing does not exceed half an hour. M. Arago, in his address to the Chamber, dwelt with much force on the value of the invention in many of the pursuits of science. It affords, in particular, the means of taking, so exactly and so expeditiously, representations of astronomical objects, such as the surface of the moon, the stars, the nebulae, and the spots on the sun, that it must give a great impulse to this science. Professor Nichol of Glasgow has also shown how it may be applied to the registering of temperature by means of the thermometer. Its value to travellers, in taking representations of ancient buildings, of natural productions, and other objects, must be obvious. It is also worthy of note, that a drawing of a building executed by the Daguerrotype, will, if the distance of the camera from the object have been noted, afford the means of calculating the height and other dimensions of that building.

We have ourselves a somewhat remarkable fact respecting photography to communicate to the public. Since the subject came into notice in Britain, a young Scotch barrister of our acquaintance has brought to us a number of specimens of the art, executed by himself and his young companions, *fifteen years ago*, when they were attending the grammar-school of Aberdeen. Photography, which has since become the subject of so much interest and so much discussion among grave men, was then and there practised merely as one of the ordinary amusements of the boys, a sheet of paper covered with nitrate of silver, and then held up to a sun-lit window with a leaf or feather or picture before it, being the whole mystery of the process. Our young

friend has no recollection of its being considered as any thing either new or wonderful: it simply ranked amongst the other amusements which boys in a great school hand down from one to another. The specimens exactly resemble those which have been exhibited during the last few months before our scientific societies, but are of course very different from the exquisite productions of M. Daguerre, as described by Sir John Robison.

"MEANS AND ENDS," BY MISS SEDGWICK.
THIS eminent American authoress has recently, as many of our readers may be aware, arrived in England, for the purpose of residing in it for a short time. She has already published in this country a little volume, entitled "Means and Ends,"* being addressed to young women, and designed to instruct them in some of their more obvious duties. She says in the preface—"Being in this beautiful land of my ancestors—the land that has produced whatever the world has known of best and greatest—I feel an inexpressible pleasure in the possibility that I may confer benefit even on one of its humble homes." We earnestly hope that this highly moralised writer will live to confer benefit on many of these homes, and also on others not precisely liable to the qualification "humble." The following extracts from the section on conversation will entertain our readers, and convey that favourable impression of the present volume to which it is entitled.

GOSSIPING.

The most prevailing fault of conversation in our country, and I believe in all social communities, is *gossiping*. As weeds most infest the richest soils, so gossiping most abounds amidst the social virtues in small towns, where there is the most extended mutual acquaintance, where persons live in the closest relations, resembling a large family circle. To disturb the sweet uses of these little communities by gossiping, is surely to forfeit the benefit of one of the kindest arrangements of providence.

In great and busy cities, where people live in total ignorance of their neighbours, where they cannot know how they live, and hardly know when they die, there is no neighbourhood, and there is no gossiping. But need there be this poisonous weed among the flowers—this blight upon the fruit, my young friends?

You may understand better precisely what comes under the head of gossiping, if I give you some examples of it.

In a certain small thickly-settled town there lives a family, consisting of a man, his wife, and his wife's sister. He has a little shop, it may be a jeweller's, saddler's, shoemaker's, or what we call a store—no matter which, since he earns enough to live most comfortably with the help of his wife and sister, who are noted for their industry and economy. One would think they had nothing to do but enjoy their own comforts, and aid and pity those less favoured than themselves. But, instead of this, they volunteer to supervise all the sins, follies, and shortcomings of their neighbours. The husband is not a silent partner. He does his full share of the low work of this gossiping trio. Go to see them when you will, you may hear the last news of every family within half a mile. For example, as follows:—"Mr — gave 150 dollars for his new waggon, and he had no need of a new one; the old one has not run more than two years."

"Mrs — has got a new hired help; but she won't stay long; it's come and go there."

"Mrs — had another new gown at meeting yesterday, which makes the fifth in less than a year, and every one of her girls had new ribbons on their bonnets; it is a good thing to have rich friends; but, for my part, I had rather wear my old ribbons."

"There go Sam Bliss's people with a barrel of flour; it was but yesterday she was at the judge's, begging."

"None of the widow Day's girls were at meeting; but they can walk out as soon as the sun is down."

This is but a specimen of the talk of these unfortunate people, who seem to have turned their home into a common sewer, through which all the sins and foibles of the neighbourhood run. Have they minds and hearts? Yes; but their minds have run to waste, and there is some taint, I fear, at their hearts.

The noted gossip, Miss —, makes a visit in a town, where she has been previously a stranger. She divides her time among several families. She is social, and, what we think is misnamed, agreeable: for she is perpetually talking of persons and things. She wins a too easy confidence, and she returns home with an infinite store of family anecdotes. She knows that Mr and Mrs So and So, who are supposed to live happily, are really on bad terms, and that he broke the hearts of two other women before he married his wife; she knows the particulars, but she has promised not to tell. She has found out that a certain family, who for ten years have been supposed to live very harmoniously with a stepmother, are really eminently wretched. She has heard that Mr —, who apparently is in flourishing circumstances, has been on the brink of bankruptcy for the last ten years—&c. &c. Could this woman find nothing in visiting a new scene to excite her mind but such trumpery? We have given you this example to show you that the sin of gossiping pervades some communities. This woman did not create these stories. She heard them all, the individuals who

told them to her little thinking that they in turn would become the subjects of similar remark to the very persons whose affairs they were communicating.

What should we think of persons who went about collecting for exhibition samples of the warts, wens, and cancers, with which their fellow beings were afflicted? And yet would not their employment be more honourable, more humane at least, than this gossip-monger's?

We have heard such talk as follows between ladies, wives, and mothers, the wives of educated men, and persons who were called educated women.

"Have you heard that Emma Ellis is going to Washington?" "To Washington! how on earth can the Ellises afford a winter in Washington?" "Oh, you know they are not particular about their debts, and they have six girls to dispose of, and find rather a dull market here."

"Have you heard the Newtons are going to the country to live?" "Bless me! no: what's that for?" "They say to educate their children; but my dress-maker, Sally Smith, who works for Mrs Newton, says she is worn out with dinner parties. He runs the house down with company."

"Oh, I suspect they are obliged to go to economise. You know she dresses her children so extravagantly. I saw Mary Newton at the theatre (she is not older than my Grace) with a diamond ferretiere."

"Diamond, was it? Julia told me it was an aquamarine. The extravagance of some people is shocking! I don't wonder the men are out of patience. Don't tell it again, because Ned Miller told me in confidence. He actually has locked up all his wife's worked pocket handkerchiefs. Well, whatever else my husband complains of, he can't find fault with my extravagance."

Perhaps not; but faults far more heinous than extravagance this poor woman had to account for—the pernicious words for which we must be brought into judgment.

I hope it may appear incredible to you, my young friends, that women, half way through this short life, with the knowledge of their immortal destiny, with a world without them and a world within to explore and make acquaintance with, with the delightful interests and solemn responsibilities of parents upon them, should so dishonour God's good gift of the tongue, should so waste their time, and poison social life. But be on your guard. If your minds are not employed on higher objects, and your hearts set on better things, you will talk idly about your friends and acquaintance.

The habit of gossiping begins in youth. I once attended a society of young persons, from thirteen to seventeen years of age, who met for benevolent purposes.

"Is this reading or talking afternoon?" asked one of the girls.

"Reading," replied the president; "and I have brought Percy's Reliques of English Poetry to read to you."

"Is not that light reading?" asked Julia Ivers.

"These are old ballads and songs."

"Yes, I suppose it would be called light reading."

"Then I vote against it; mother don't approve of light reading."

Julia, who had the lightest of all minds, and the most voluble of tongues, preferred talking to any reading, and without loss of time she began to a knot of girls, who too much resembled her.

"Did you notice Matilda Smith last Sunday?"

"Yes, indeed; she had on a new silk dress."

"That is the very thing I wanted to find out, whether you were taken in with it. It was nothing but her old sky-blue dyed!"

"Can that be? why, she has worn it ever since she was thirteen. I wonder I did not see the prints of the tacks."

"I did," interposed another of the young Committee of Investigation. "I took a good look at it as she stood in the door. She couldn't deceive me with aunt Sally's wedding sky-blue dyed black."

"I don't think Matilda would care whether you were deceived or not," said little Mary Morris, the youngest member of the society, colouring up to her eyes.

"Oh! I forgot, Mary," said Julia Ivers, "that Matilda is your cousin."

"It is not because she is my cousin," replied Mary.

"Well, what is it then?"

Mary's tears dropped on her work, but she made no other reply. She had too much delicacy to proclaim her cousin's private good deeds; and she did not tell how Matilda, having had a small sum of money, which was to have been invested in a new silk gown, gave it instead to her kind "aunt Sally," who was sinking under a long indisposition, which her physician said "might be removed by a journey." It was—and we believe Matilda little cared how much these girls gossiped about her dyed frock.

Julia Ivers turned the conversation by saying, "Don't you think it strange that Mrs Sandford lets Maria ride out with Walter Isabel?"

"Yes, indeed; and, what is worse yet, accept presents from him."

"Why! does she?" exclaimed Julia, staring open her eyes, and taken quite aback by another person knowing a bit of gossip which had not yet reached her ears.

"Yes, she does; he brought her three elegant plants from New York, and she wears a ring which he must have given her; for you know the Sandfords

* London, Charles Tilt.

could not afford to buy such things; and, besides, they never do."

I have given but a specimen. Various characters and circumstances were discussed, till the young gossips were interrupted by a proposition from the president, that the name of the society should be changed; "for," as she said, "the little charities they did with their needles were a poor offset against the uncharitableness of their tongues."

There is a species of gossiping aggravated by treachery; but, bad as this is, it is sometimes committed more from thoughtlessness than malice. A girl is invited to pass a day, a week, or a month it may be, in a family. Admitted to such an intimacy, she may see and hear much that the family would not wish to have reported. Circumstances often occur, and remarks are made, from which no harm would come if they were published to the world, provided what went before and came after could likewise be known; but, taken out of their connection, they make a false impression. It is by relating disjointed circumstances, and repeating fragments of conversations, that so much mischief is done by those admitted into the bosom of a family.

You know that, with the Arabs, partaking salt is a pledge of fidelity, because the salt is a symbol of hospitality. Show a sacred gratitude for hospitality by never making any disparaging remarks, or idle communications about those into whose families you are received. I know persons who will say, unblushingly, "I am sure that Mr So and So is not kind to his wife. I saw enough to convince me of it when I staid there." "Mrs S. is very mean in her family." "How do you know that?" "I am sure I ought to know, for I staid a month in her house." "If you wish to be convinced that Mrs L. has no government over her children, go and stay there a week, as I did." "The B's and their stepmother try to live happily together; but if you were in their family as much as I am, you would see there is no love lost between them."

Now you perceive, my young friends, that the very reason which should have sealed this gossip's lips, she adduces as the ground of your faith in her evil report.

I have dwelt long on this topic of gossiping, my young friends, because, as I said before, I believe it to be a prevailing fault in our young and social country. The only sure mode of extirpating it is by the cultivation of your minds and the purification of your hearts.

All kinds and degrees of gossiping are as distasteful to an elevated character, as gross and unwholesome food is to a well-trained appetite.

WADE'S BRITISH HISTORY.*

THIS is such a book as we have long wished to see—a condensed view of not only the public and more conspicuous occurrences of our national existence, but also of those private and domestic circumstances which reflect more light, perhaps, on the progress of a people, than the most important political transactions. From the statement of pages below, our readers will perceive that it is a very large volume. The history is given in sections, mostly referring to brief spaces of time, generally to less than a reign. Each of these sections first presents an outline of the political history of the period; then, in a smaller type and in double columns, follows a chronological arrangement of transactions, both political and otherwise, including the heads of acts of parliament, deaths of remarkable persons, the results of statistical inquiries, &c. As a register, it is much more copious than could well have been expected within such bounds. With respect to correctness of dates and facts, the present writer, with the advantage of perhaps rather more than the average acquaintance with the minutiae of British history, is inclined, from the inspection he has given to the volume, to return a favourable verdict. There is less accuracy as to the orthography of names of persons and places. The political tone of the author's mind is that of a Whig; his views, apart from politics, are philanthropic, and favourable to all that promises to increase the wealth, morality, and refinement of the people. We would recommend the book as an excellent one for reference, fit to rank with Mr McCulloch's Dictionary of Commerce, and Ure's Dictionary of Arts and Manufactures. It is calculated to be of especial use to schoolmasters, as a source of minute information wherewith to illustrate the brief narratives read by the children under their charge.

A specimen of the register in Mr Wade's book is obviously not suitable to these pages: the reader will probably take more interest in the following view of the

PROGRESS OF RAILWAYS.

"Both rail-roads and steam-navigation may be considered the inventions of the present century. There were crude attempts previously in both descriptions of mechanical contrivances, but they were either wholly unsuccessful, or of such limited utility as to discourage their general adoption. In the Newcastle collieries wooden railways were used in the seventeenth century, and for which, on a limited scale, iron began in 1767 to be substituted as a more durable material. This experiment met with so little encouragement, that,

thirty years after, a Mr Carr published a book, claiming to be the first inventor of cast-iron rails. These railways, it may be remarked, were all private undertakings; no public railway was attempted. The first act of parliament for a work of this kind was passed in 1801, and was for the construction of a railway in the vicinity of London, from Wandsworth to Croydon. In the twenty-three years that followed, only twenty-one acts were passed for railways, showing the little alacrity with which the new power was brought into use.

There is another discovery connected with the subject of this section, in the first introduction of the locomotive carriage. The Sirius and Great Western may be considered great locomotive steam-carriages on the waters, but those on land form a separate and distinct contrivance, though the motive powers of both are derived from the same mighty agent. Railways, for nearly two centuries after their introduction, were considered only as a means of economising, not superseding, animal labour. So early as 1759, the idea of applying steam-power for propelling carriages was thrown out by Dr Robinson of Glasgow; and, in 1784, Watt, in the specification of one of his patents, stated that it was intended to use his steam-engine for the same purpose; but neither of these philosophers made any effort for reducing their suggestions to practice. In 1787, Mr Symington exhibited the model of a steam-carriage in Edinburgh, but it was not until 1804 that Trevithick invented and brought into use a machine of this kind upon the railroad of Merthyr Tydvil in Wales.

It is a singular fact in the early history of locomotive carriages, that their projectors assumed the existence of a difficulty which is now known to be wholly imaginary; and, like the ancient Romans in the conveyance of water, without a knowledge that it would rise to its level, they resorted to sundry laborious contrivances for overcoming an obstacle that had no existence, and which Nature herself, had she been asked, would have accomplished for them. They assumed that the adhesion of the smooth wheels of the carriage upon the equally smooth iron rail must necessarily be so slight, that, if it should be attempted to drag any considerable weight, the wheels might indeed be driven round, but that the carriage would fail to advance, because of the continued slipping of the wheels. The remedies devised for this fancied counteraction were various. One was conceived so valuable that a patent was taken out for it in 1811, by Mr Blenkinsop of Leeds. It consisted, as the writer well remembers, of a rack placed on the outer side of the rail, into which a toothed wheel worked, and thus secured the progressive motion of the carriage. It was, however, wholly useless—it was an impediment; the simple adhesion of the wheels with the surface of the rails upon which they are moved, being by an immutable law amply sufficient to secure the advance, not only of a heavy carriage, but of an enormous load dragged after it. The honour of discovering this oversight is due to Mr Blackett; but the idea of a want of adhesion had taken such firm hold of the public mind, that it was not generally removed till the opening, in 1830, of the Liverpool and Manchester railway.

A second misconception in the history of these inventions deserves to be recorded. It is a fact that, of all the railways constructed and contemplated up to the opening of the Liverpool and Manchester line, not one was undertaken with a view to the conveyance of passengers. In the prospectus of that work, a hope was held out that one-half the number of persons then travelling by coaches between the two towns might avail themselves of the railway, in consideration of the lower rate for which they could be conveyed; but the chief inducement held out to subscribers was the conveyance of raw cotton, manufactured goods, coals, and cattle. On the contrary, steam-vessels were originally projected for the conveyance, in rivers or coastwise, of passengers only; and they were not employed in this kingdom for the transport of merchandise before the year 1820.

It does not belong to the plan of this work to exhibit the statistics of these extraordinary innovations; only to record, in chronological order, their introduction and progress. At the close of the present reign (William IV.), the island was undergoing, and to a great extent had undergone, an entirely new demarcation, with a zeal not less ardent, and capital and intelligence more ample, than signalled the beginning of turnpike roads and canal navigation. From London, as a centre, lines are radiating in all directions—east, west, north, and south; and these lines are being met transversely by other lines, crossing and intersecting each other at the great estuaries of population and industry—Birmingham, Manchester, Liverpool, Leeds, Norwich, and Edinburgh; which a few years hence will form so many grand railway stations, whence individuals may reach any part of the kingdom in almost as short a time as they traverse the metropolis from one part to another, from Charing Cross to Mile End, Paddington, Camberwell, or Turnham Green.

Had not the government adhered so tenaciously to the system of interfering with nothing that can be executed by individuals, or the joint means of individuals, it is probable some of the new undertakings might have been carried on with more dispatch, economy, and advantage to the public.* - - Rival

companies have competed at an immense cost for different lines, and the interests of private parties have interfered to bias the decisions of parliamentary committees; all or a portion of which evils would have been obviated by the government determining, by preliminary surveys, the most eligible lines, leaving only the execution open to general competition. The expenses incurred by the railway companies in these contests, in buying off opposition, and in battling their projects through parliament, has been enormous, as appears from the following statement of parliamentary charges incurred in obtaining acts of incorporation for the following undertakings:—

London and Birmingham	£ 72,863
Great Western	88,710
London and Southampton	39,040
Midland Counties	28,776
Birmingham and Gloucester	12,000
Great North of England	20,526
The Grand Junction	22,757
Bristol and Exeter	18,592

All this outlay will have to be repaid by the public to the proprietors of the roads, in the form of excessive fares, in addition to the enormous cost of the works. On the London and Birmingham line of 112 miles, had been expended up to June 30, 1838, eleven weeks before it was opened for traffic throughout, £ 4,553,557, 11s. 9d.; and, in the opinion of the directors, the entire expenditure would amount to five millions before the works are in all respects complete. It is indicative of some precipitancy in these undertakings, that before the London and Birmingham railway had been finished the Manchester extension line had been projected, by which the distance between that town and the capital would, by the Grand Junction and the Birmingham, be reduced from 208½ to 179 miles. The total estimated cost of the Great Western railway from London to Bristol, August 15, 1838, was £ 4,560,928. The total number of acts of parliament obtained for railways from the first in 1801 to 1837 inclusive, has been 174, of which number 97 have been passed in the present (William IV.) reign."

JOE WITTON AND THE CUNNING WOMAN.

ILLUSTRATIVE OF A SUFFOLK SUPERSTITION.

BY MISS AGNES STRICKLAND.*

In this age, will it be credited, that, within a hundred miles of London, in the eastern counties of England, the lower orders of people believe that the *ague* (which is commonly very prevalent in flat, marshy districts, during wet seasons) proceeds from no other cause than the malicious vagaries of a certain moist fiend, a sort of *ignis fatuus*, who haunts the fens and lowland pastures, where he lies in wait for all such luckless wights as may be unwary enough to enter his demesnes after sunset! Sometimes, not content with such stray game, this terrible imp bestrides a vapour, or sails forth on a fog-wreath, and takes a wider range for prey through the hamlets, villages, or scattered cottages farther afield, where he, generally speaking, selects his first victims from the children who incautiously sit on green banks in the deceitful sunshine of March, or sleep on the wet grass after showers. These are small beginnings, but in no respect to be despised; for once get the *ague*-fiend into the house, say those *time-honoured* sages, the oldest inhabitants of the place, and you know not when it will be possible to get him out again; since it hath been observed from time immemorial that the very day, ay, the very hour and minute, that he leaves one member of a family, he attacks another; and, generally speaking, goes his rounds through them all without favour or exception. In fact, the ignorant sufferers from the *ague* will not be dissuaded from the idea that this distressing intermittent fever is something of a demoniacal possession, and two centuries ago this belief was not confined to the lower orders alone; that learned and minute antiquary, Anthony-a-Wood, relates, in sober seriousness and with pathetic quaintness, a circumstantial account of the manner in which himself and a fellow student were afflicted by the *ague*, and the various schemes which they practised to rid themselves of its persevering influence; but all in vain, for no sooner was one freed from it than it attacked the other, till the knowing old farmer in whose house they had hired "a convenient upper chamber, with the rare accommodation of a fair shelf on which to lay their books," informed them that they knew not how to deal with the *ague*, which was not to be driven out by means of medicine like an ordinary fever, since it was of a nature wholly different. Old Anthony gravely then proceeds to state how he and his fellow-student, in compliance with the said farmer's advice, rowed down a running stream, and when they were in the middle leaped from the boat on to the bridge, and from the bridge to the land, fling-

* British History, Chronologically Arranged; from the first invasion of the Romans to the accession of Queen Victoria. By John Wade, author of the "History of the Middle and Working Classes," &c. 8vo. pp. 1184. London, Edinham Wilson, 1839.

* The author here contends in favour of the suggestion which has been made, that the railways ought to have been state speculations—a view in which we are not prepared to support him.

* The above paper was first printed a few years ago in a periodical work of limited circulation. It is here republished, by virtue of an arrangement with the author.

ing the bridge, which consisted of a single plank, back to the opposite shore, which manœuvres they effected so speedily withal, that they fairly left the ague in the lurch, which could by no means pass over the running water unless by the aid of the bridge, but was sure to attack the next person that attempted to enter the boat, no matter whom. Anthony-a-Wood and his chum were released from its spell, and returned cheerfully to their chambers at Oxford, and the old farmer, though he lost his lodgers, exulted in his sagacity in outwitting the ague.

Almost precisely similar to this quaint relation of the learned chronicler, as far as regards the popular superstition of Oxford, was the account which an old ploughman, who worked on my father's estate some years ago, gave me of the manner in which he and his master got rid of the ague, after it had held them for more than two years, resisting alike medicines, charms, and every device they could imagine to expel it.

"For sartainly," quoth old John Witton, "this was a special arguing fever"—let none of the learned professions take offence; these were his veritable words—"and one of the most subtlest to deal with I ever met with in all my days. As true as I'm alive, he neither minded pepper and gin taken fasting on a Friday morning, nor blackbottle spiders made into pills with fresh butter, nor agrimony tea; and as for doctors' stuff, it was all meat and drink to him; for the more of it I took, the worse I got. Then I went to old Betty Snowling, the cunning woman, who lived in my young time, just fifty summers ago, at the north end of the pathway pigstie, and sometimes went up to the hall, when old my-lord was out of the way, and the young my-ladies chose to have their fortunes told unbeknown to him; and so I said to her, 'Mrs Snowling,' says I, 'for I thought it were best to be civil, 'what am I to do to get rid of this argy, which has almost shaken all my teeth down my throat?' 'Why, narbor Witton,' quoth she, 'to-night's the full o' the moon, and if you'll give me a shilling and a groat, and a farthing for luck, I'll chalk up a cross in my chimbley-back for you, and the argy will waste away as the moon wanes, and you'll be free from it by this day fortnight.' 'Narbor,' says I, 'that's a long time to wait; I'll give you a crown if so be that you'll send it away to-night.' 'Give us hold of the crown,' says she, 'and I'll put you up to a scheme.' So I hauls out my money, and sorely vexed were I to part with it so lightly; but if it had been ten times the size, and sterling gold, I would have given it to get rid of this arguing fever. So then, Betty Snowling went to a corner cupboard, and took out her box of charms, as she called them, and she gave me one of them, which looked as much like a tenpenny nail as ever I saw a thing in my life; howsoever, it had more virtue in it than that could have, as you shall hear.

"When do you expect the fit?" says she. "At six o'clock to-morrow morning, please God," says I. "Then," says she, "go to the four crossways to-night, all alone; and just as the clock strikes twelve, turn yourself about three times, and drive that nail into the ground up to the head, and walk away from the place backwards, before the clock is done striking, and you'll miss the argy; but the next person that passes near the nail will take it in your stead." Sorely glad was I to hear that; and if it had been my own father that was to pass over the nail, I shouldn't have stopped for that, so as I got rid of the argy. When the clock struck eleven, and all decent people were abed and asleep, except my mistress, who was sitting up for master, who was out at a fair, and I began to feel a little queerish or so, as if this argy would come on afore the time with the thought of what I had to do; however, I reached down my hat as soon as the hands pointed to the half hour, that I might be in time. "Where are you going?" says my mistress. "To drive a tenpenny nail in the crossways, to cure the argy," says I. "Umptious! very umptious," says she, holding up her hands; "oh, Johnny, Johnny, I'm afraid you've been dealing with old Betty Snowling, who witched my dear little Samny with an evil eye, and bespoke his death when he was as fine a boy as ever mother smiled on, and before the week was out he was shrouded, and coffined, and laid in the churchyard." And then she would fain have told me the whole long story of master Sammy's sickness, and death, and burial, with the names of the children who carried him to the grave, and the mourners who followed him; but, thinks I, if I stay to hear all that, I shall lose the nick of time to drive the nail into the four crossways, and have another fit of the argy. So as soon as mistress put her apron to her eyes, which she always did when she talked of master Sammy, I slipped out of the kitchen, and ran without stopping, through the churchyard to the crossways, and all the time I consated that I were dodged by two black imps, that properly frightened me. Well, when I came to the crossways, at the end of Calve's lane, going on to the common, there I stood and heaved for breath, for I had run very fast; and then I thought the place looked mighty lonesome, and I began to wonder whether any body were ever buried there, for being necessary to their own death, as 'twas the four crossways, and our mistress had talked of its being umptious to drive a tenpenny nail there. And for sartain the nail must have belonged to the devil, as it came out of Betty Snowling's box of charms. And what, thought I (as I took it out of my pocket, that it might be all ready against the clock began to strike), if it should turn red hot and burn my fingers; and I would have flung it over my left shoulder

to be rid of it, if I had not bought it at such a dear rate; and I shook every joint of me as much as if it had been the hour for the argy, when the church clock began to strike twelve. There was no time to be lost then, if I meant to get rid of the argy that night; so I began to turn myself round, and had turned three times before the third stroke of the clock had sounded, and down I went upon all-fours to hammer the tenpenny nail into the earth with a great stone; but I hadn't a ha'porth of strength left in my blessed bones, and my hand shook like an aspen leaf, and there went the old clock, dang, dang, dang, dang, dang, six strokes, before I had fitted the nail to the ground, and the stone to the head of the nail; dang, dang, went the clock again; knick, knock, went the stone on the head of the nail; dang went the clock again; knick, knock, knock, went the stone; it was well the ground was soft, or I never should have driven it into the earth, for I were all the same as a young child. Dang went the old clock again, eleven strokes; my heart was up in my throat. Skra-a-ah, shrieked the grey owl in the witch-elm over my head; I thought it were Old Harry himself, and Betty Snowling laughing at me for a fool, and that riled me; so down went the stone and drove the nail in smack up to the head, just as the twelfth stroke was beginning to ring in my ear, and I was up and off like a whirligig, and bounced into mistress's kitchen before her clock, that was five minutes slow, had done striking. But whether I went backwards or forwards from the crossways, after I had knocked in the nail, I never could tell, so properly scared were I at the thought of the devil and Betty Snowling. But for sartain I was more afraid of the argy than either, or I never dared have done such an umptious thing, as mistress said. Howsoever, I shall remember to my dying day the pint of humming harvest beer she had heated over the fire for me against I came in, and put such a glass of gin into it, with a toast of bread and a dip of treacle, that it comforted and warmed my very heart, and does me good to think of it now.

Well, ten minutes after in comes master, looking as blue as a harvest-plum, and he sits down by the fire, and he creeps closer to it and closer, and says, 'It's purely cold to-night, mistress,' and presently his teeth fall to chattering, and he begins to dudder all over; and thinks I to myself, but I said nothing, you may be sure, 'As sure as a gun, master, you're in for my argy-fit, for you're the first man that have passed over the tenpenny nail; and sure enough I was right, for I missed the fit that very morning, and master took it, and had the argy sixteen weeks from that time. My mistress always told him it was all along of his staying out so late at the fair, but I knew it came of his crossing over the nail; for, as ill luck would have it, Teddy Todd the turnip-boy, and Charley Cobb the-cow boy, knew it too, for the curious young toads had sneaked arter me, as I found out in a little time, 'cause they had taken it into their fools' heads that I were going to try a love charm, and they wanted to get a little information about them sort of things, and went watching o' me, crawling on hands and knees arter me, as I went through the churchyard to the crossways, little for thinking the real business I were upon, which made every hair stand on end on their heads, for fear the argy-fiend should lay hold on them. Be sure they sneaked home, and took care not to go over the tenpenny nail.

At last master went to Betty Snowling himself to hear of a cure, and she told him to cut nine notches in the cross-bar of a stile before sunrise the morning he expected the fit, and the next person who crossed over that stile should take in the argy instead of him. And sure enough master did as he was told, and said nothing about it to nobody; and who should be the unlucky body to cross the stile that morning first but I my own self! and true as I am alive, I was argy-ridden again worse than ever; and the worst of it was, that the fits took me every night, so that I could not get down to the four crossways to drive in the tenpenny nail at the proper time to witch the arguing fever to somebody else. So away I went at last to Betty Snowling once more, and directly she looked in my face she told me I had got the argy again, and had come to her for a charm. 'But,' said the hungry witch, 'it's of no use coming to me without money in hand.' So I showed her all the money I had left, which was two shillings and sevenpence ha'penny. Then she said, 'Johany, I must leave you enough to pay the hangman, I suppose,' and with that she took the sixpence and one of the shillings, and left me just thirteence ha'penny; and sixpence out of that I gave her on the spot for her to tell my fortune, that I might know what she meant about the hangman. And then she told me that it was all a joke. However, she gave me a string off the handle of her own broom, and told me to knot nine withered crab-apples upon it, and then leave them in a pathway field, across the path, an hour before I expected the fit, and that happened to be an hour before sunset. So I did as she told me; and who should be the first person to cross the field but master, and he got the argy again as bad as before. Then, when he saw as how I missed the fit that night, he began to guess that there was something of a plot in the business; and so, says he to me, 'Johnny, my man, you and I must part, for I see we have got the arguing fever betwixt and between us, and we shall have no luck while we two have a being in the same house.' 'Sure, master,' says I, 'and if we are argy-ridden, we may shift the argy away by some scheme or other.' 'Ah! Johnny,' says he, 'I have had enough of your schemes of shifting of

the argy, that's for sartain; for I never should have had it this year at all, if you hadn't a-driven that tenpenny nail in my path that you knew I must take in coming home from the fair that night, when you first miss'd the fit.' Then I knew by that saying of his that them tiresome toads, Teddy the turnip-boy, and Charley the cow-boy, who I had been forced to flog for some of their tricks, had 'venged upon me by telling about my witchcrafts with the tenpenny nail, for I had now made out that they were the black imps that had dodged me in the churchyard.

'True as I'm alive, Sir, I had not a thought of you, Sir,' says I, the tears coming into my eyes at the thought of losing my good place, with just only sevenpence ha'penny in my pocket to pay for quarters at some of the cottages. 'And, besides, Sir,' says I, 'I'm latten to you till next Michaelmas, and that was for better or worse you know, so you can't get rid of me afore that time without you've any thing to say against my character, but that's what I defy you to say; for though I say it as shouldn't say it, as the saying is, there isn't a steadier, honest, or soberer young fellow than I is. Saving the arguing-fever, which is no fault of mine, for I never was giving to stay out late at fairs and such likes.'

'Ah, Johnny,' says my mistress, 'that's the way people gets argys, and colds, and rhumatis, and then their poor wives have to nurse them.' 'And then,' says I, Sir, 'twasn't I that directed your crossing over the tenpenny nail, for 'twas all a game of haphazard who should be the first to pass that way; and now, after all, master, if there had been any thing in that, it would have been the horse that would have had the argy; since it were he, poor dumb creature, that passed over the nail, and not you.' 'Johnny, Johnny,' said master, shaking his head, 'that won't do; horses arn't liken to Christians, and never do take the arguing-fever; and though I don't blame your trying a scheme to shift away the argy, yet I do think you might have charmed it away into the next parish, or, at any rate, not driven your nail in my path.'

'Well, master,' says I, 'you never takes into account your notchin' the stile that I had to pass over into the bean-field so as I got the argy back again.' 'Why,' Johnny, says master, 'that was my loss in a double sort of way, d'ye see; for, in the first place, I lost your services just in the haystail and turnip-hoeing time, and in the next you brought the argy back into the house, and managed so as to fling it back on me.'

'Then,' says my mistress, 'you see all the good that comes of such umptious doings as dealing with the devil and Betty Snowling.' While we were bating the matter over, comes up to the house old Joe Spilling, the cow-leech, from Brainsford Wood, and master says to him, 'I'll give you a crown, Joe, if you can put me up to a scheme for getting rid of the argy clear out of the house.' Now Joe was a cunning old fellow, who had more know in him than any person for ten parishes round. He could tame the most unruly horse in my lord's stables, and make the most refractory cow in the county give down her milk to the dairy-maid, even the very night the butcher took away her calf. He could charm away warts and cure corns, and burn people in the ear for the toothache, bleed both cattle and Christians, and set a psalm and make the responses at church better than the old clerk, who always followed Joe's readings, and never shamed to skip the hard words that Joe could not make out; for he thought if Joe Spilling could not make them out, it were hardly to be expected that he should. Then Joe wrote and read all the valentines and love-letters for the men and maids far and near, and had given away most of the brides married in his parish, and stood godfather to the children. Ah! Joe was a special fellow; and every body used to say nothing was too hard for him to manage, if he once set his mind upon it. My lord, who was always an awful man about the game, was forced to wink at all Joe's poaching jobs, because he was such a famous hand at breaking his young dogs. Old Betty Snowling and Joe were sworn enemies, because two of a trade never agree; and it was said by some that Joe dealt not a little in her way of life; only I don't think there could have been so much sin in Joe's conjuring, or he never would have been such a constant church-goer; and folks do say that old Betty durst not go into church for the life of her. So when master asked Joe about getting rid of the argy, Joe put his finger to the side of his nose and winked three times, and said, 'You have been dealing with Betty Snowling, both of you.' 'Ah, Joey, you're a cunning chap,' says master, 'but that's not the question; I want to be advised into getting the arguing-fever clean out of the house.' 'Why, master Tibman,' says Joe, turning the crown between his finger and thumb, 'if you only depend on Bet Snowling's charms and devilies, you'll never get rid of it, for she witches it from one on purpose to send it back to t'other; so you might go on till doom's-day at a game of see-saw. Now, if you'll be ruled by me, you shall carry it not only out of the house, but clean out of the parish; so come along with me, both of you.' Off we all set, leading master between us, for the foul fiend of the argy was still ruling him; but for all that Joe made him keep up a brisk pace till we came to a little running brook that parted the parish, and by that time master was all in a heat. There was a plank laid over the brook by way of a bridge, and we all ran across it, and stepped in the other parish till the fit was quite off master. Then Joe gave him a sup out of a bottle that he had in his pocket to keep up his spirits, and we all came back to our own side, only master was last man, and we made a bound

one after the other from the plank to the shore, and flung back the plank after us to the opposite bank, and there the arguy was forced to bide till the next person passed that way, for it could by no means cross running water unless by means of bridge or boat; so we got fairly rid of the arguing-fever; and what is more, neither master nor I ever had it again from that day to this. 'Well, John,' said my father, 'and did you ever find out who was the next person to cross the brook?' 'True as I'm alive, sir,' replied John Witton, with a knowing grin, 'that was the best of the joke, for it was old Betty Snowling herself, coming home in the dusk from telling the old squire's young wife's fortune; but witch as she was, she could not tell her own, for she knew nothing of the bridge being flung back, and she set her foot where the plank used to be, and plumped right into the brook over head and ears, and for a sartain would have been drowned; only, ~~that~~ being a witch she could not sink, but floated over to the other side, and brought the arguy back into our town; only with all her charms she could not cure herself, but had it thirty weeks every day of her life, and was fain to go to the parish doctor at last to be cured, for she was too proud to apply to old Joe Spilling for a cure; no, no, she'd rather have been shook bone from bone than have gone to him for a cure.' 'But did the parish doctor make a cure of her?' demanded my father. 'Well, sir, that's more than I can tell,' replied John, 'for I heard of a service that Michaelmas at higher wage in this here parish, and left our country, and married like all the rest of the fools, because I met with a pretty girl, and here have I lived ever since, so what became of old Betty and the arguing-fever I never heard from that day to this.'

So much for the popular superstitions relating to the cure of the ague. Many of the charms ignorantly employed by the vulgar as antidotes for this disorder, are evidently relics of the homage and sacrifices rendered to the power of darkness in the ages of Pagan blindness and gross idolatry. In some parts of the county of Suffolk, I have known the following mysterious rite observed by way of a charm for the removal of this fever. A small red earthen pan was purchased, into which the afflicted person put a piece of meat (*which must be stolen*), together with a lock of his hair and the parings of his nails, and then buried it in a place where the earth had never before been broken. Surely a more complete oblation to an imagined evil spirit was never practised by the idolatrous tribes in the interior of Africa; and, as I before observed, it is doubtless a remnant of the aboriginal idolatries of the island, and might even be traced by the curious antiquary as a rite observed among the Druids.

LAND NEAR THE SOUTH POLE.

THE immense regions encircling the South Pole remain in a great measure unexplored. Our maps and globes present all within the Antarctic circle as one continuous sheet of water or ice, and on the outside also, for many degrees of latitude, there are laid down only enormous unoccupied tracts of ocean. This was not the case with the older charts and maps of the Southern Pacific. They boldly indicated the existence of vast ranges of land in that quarter of the globe, though, from a total ignorance of all connected with this same country, they were obliged to call it *Terra Australis Incognita*, the Unknown Land of the South. Some excuse for this map-filling procedure was derived from the statements of various early voyagers, and from the universality of the belief entertained by scientific men regarding the existence of a southern continent of prodigious extent, and probably both inhabitable and inhabited. Buffon entertained this opinion, and indulged his imagination by forming the liveliest pictures of the riches of the new continent, and of the vast benefits which would result to commerce from its discovery. Honest, practical Captain Cook did much to extirpate such vain fancies, though he himself believed in the existence of land around the South Pole, as the following quotation from the narrative of his second voyage is sufficient to prove: "In Captain Cook's opinion, the ice that is spread over this vast Southern Ocean must originate in a tract of land, which he firmly believes lies near the pole, and extends farthest to the north, opposite the Southern Atlantic and Indian Oceans, ice being found in these farther to the north than any where else." In fact, Captain Cook himself saw land in latitude 59 degrees 13 minutes, and longitude west 27 degrees 45 minutes, which he could not weather, or sail round, to the south, and which he thought might be the point of a continent extending back towards the pole. This land was called Sandwich Land, and lay to the south-east of Cape Horn. But though thus admitting, upon tolerable evidence, the probability of the existence of a southern continent, Cook thought that the land must lie too near the icy pole to be worth the toil even of attempting to explore it farther, and, in short, that it would present "the horrid aspect of a country impenetrable by the animating heat of the sun's rays—a country doomed to be immersed in everlasting snow." The great navigator substantiated this opinion to a certain extent, by making long and careful explorations on the navigable borders of the polar circle, all of which ended in the discovery of no land or continent in habitable latitudes.

In this state the question long remained, Captain Cook's accuracy of observation being so much trusted in, as to render future explorers of the globe unwilling

to throw away further time in examining the borders of the Antarctic circle. At length, a little merchant brig, the Williams of Blythe (in Northumberland), William Smith master, chanced to be passing from Buenos Ayres to Valparaiso, in the month of February 1819, when the master, fancying that he could improve upon the common passage round Cape Horn, took a wide tack to the south. He in consequence came in sight of what he imagined to be land, at the distance of two leagues. He saw many fields of ice floating about at the same time, and satisfied himself that he was not committing the common error of mistaking one of these for land. This spectacle, occurring in latitude 62 degrees 40 minutes, and longitude 60 degrees, surprised Mr Smith very much. On the second day he stood in towards the land, but approached near enough only to satisfy himself more fully of its true character, and also that it appeared to be an island. To the westward he observed more land. The whole had a bare and rocky aspect, but exhibited snow merely in a very few places. Seals and whales were abundant on these shores. Mr Smith was obliged to content himself with this distant survey, being principal owner of the brig, and fearing to endanger the validity of his policy of insurance in case any accident resulted from the prosecution of the search. Accordingly, he sailed northward and north-westward, and arrived in good time at Valparaiso.

The people there laughed at the master of the brig Williams when he told them of having seen land in such and such latitudes. They ridiculed the notion utterly, and assured him that he must have mistaken ice-islands, after all, for solid land. But Mr Smith, who was a native of Northumberland, had been brought up in the Greenland fishery, and knew the peculiar appearance of icebergs so well, that he was not easily shaken in his opinion. When he left Valparaiso to return to the Rio de La Plata, he sailed again to the south-east of Cape Horn, but the unusual abundance of loose ice then in those seas compelled him to proceed at once to his original destination. At Monte Video, the assertions of Mr Smith became again the subject of ridicule. Some persons, nevertheless, appear to have believed him. These were sharp-eyed American merchants, who offered to charter the brig Williams on a voyage of discovery, and to employ it in whaling, as the ostensible object of the enterprise. But Mr Smith seems to have discovered that the Americans had formed certain national views regarding the sovereignty of the new land, and having the loyal determination in his breast that the discovered territory should belong to Britain, and to Britain only, he refused to disclose the particular latitude and longitude to any but one of his own countrymen. On this rock the negotiation split, and Mr Smith had to wait long, and at great cost to himself, for a new freight. At length he shipped a cargo for Chili, and set sail for that coast, with the determination to verify his former observations by the way. On the 15th of October 1819, he came in sight of land, nearly in the same latitude and longitude as before. He bore up within four miles of it, and discovered it to be an island, covered by innumerable penguins. On the ensuing morning, the master of the Williams could plainly distinguish the mainland, or what appeared mainland, bearing the form of a line of coast running up to a prominent cape on the north-east. To this cape Mr Smith steered, and, seeing a good harbour, he sent a boat's crew and the first mate on shore, where, with three cheers, they planted a board with the Union Jack, and took possession of the land in the name of the king of Great Britain, calling it *New South Shetland*.

The character of the newly discovered country was not very promising at this point. The land was elevated and disposed in hills or great rocks, seemingly of a slaty character, while the coast and low ground were barren and covered with broken slaty stones. The sea on the coast, however, was particularly rich in the spermaceti whale, seal, sea-otter, and such like animals. Only the higher points of land were whitened with snow. The course of Mr Smith now lay to the west, but before leaving the cape alluded to, he saw that, on the eastern side, the shore shelved away to the south-east, continuing as far as the telescope could follow it. In a south-westerly direction, the brig followed the direction of the coast, keeping always within sight of it, for a distance of two hundred and fifty miles. The character of the land was not always the same, as Mr Smith could distinctly perceive some points of it to be clothed with trees, which bore a strong resemblance to Norway pines, and seemed to grow to a tolerable height. Indeed, the whole coast had a striking similarity to that of Norway. When the sailors were on shore, also, they saw abundance of wild land-fowls and fresh-water ducks—a sight indicative of no disagreeable severity of climate and temperature. Having spent no less than six weeks in the meritorious task of acquiring a further knowledge of the country, the enterprising commander found it absolutely necessary to continue his route for Valparaiso.

On reaching that port, his clear and distinct description of the new land, with the evidence of his drawings and of the crew of his brig, satisfied every one that there had indeed been an interesting discovery made. The British naval commander in this region was at once convinced that New South Shetland might be made a place of the utmost consequence to the British whale fishing in the Pacific, particularly as regarded that most valuable variety of the Cetaceous tribes, the spermaceti whale. The existence of land-fowl on the

coasts even excited the hope that various useful and valuable furred animals might be found there, in addition to the seals and sea-otters which had been seen by the crew of the Williams.

In the Philosophical Journal, to which a lengthened notice of Smith's discovery was some years ago communicated, many arguments are offered in support of the belief that this New South Shetland is really but a part of a large continent—the unknown Austral land of chart-makers. But this proved not to be the case. The report of Captain Smith sent off numerous adventurers, in the course of a few years, from the coasts of South America, both eastern and western. They found New South Shetland to be one of a group of pretty large islands, twelve or thirteen in number, and now rejoicing in such names as Barrow, Livingston, and others. The trouble of the parties who visited New South Shetland was well rewarded. The quantities of oil and skins procured on the coasts were very great; but of late years adventurers have gone thither in such numbers, that the supplies have been drained to a serious extent. The soil of these islands is, to appearance, entirely volcanic, and some of the land is more than 2000 feet above the sea.

The great Austral Continent, therefore, is not as yet a thing certainly existing, and the vast blank about the South Pole, visible in our maps and globes, remains unfilled up.

OCCASIONAL NOTES.

THE FROG IN IRELAND.

"OF the existence of the frog in Ireland, very erroneous opinions have been entertained. I need not again allude to the legend of St Patrick's extirpatory malediction against the whole race of reptiles; but it is worthy of observation, that even of late years, the belief that frogs, in common with snakes, could not live in that favoured island, was very general. The truth, however, is, that this species is not only now an inhabitant of that place, but, as will appear by the following extract, has been so since the very beginning of the eighteenth century. I owe the knowledge of this passage to my friend W. Ogilby, Esq., who communicated it to me in the following letter:—

"The following is the extract from Swift's work of which I some time since spoke to you, concerning the introduction of frogs into Ireland. It occurs in a tract styled, 'Considerations about Maintaining the Poor,' which, though without date, I fancy from the context, and other collateral evidence, must have been written about the year 1726. Among the public grievances of which he complains, he rather singularly mentions the practice of insuring houses in English offices, which, it appears, was then becoming common in Ireland. 'A third' [absurdity], says he, 'is the Insurance Office against fire, by which several thousand pounds are yearly remitted to England (a trifle, it seems, we can easily spare), and will gradually increase till it comes to a good national tax; for the society marks upon our houses (under which might be properly written, 'The Lord have mercy upon us'), spread faster and further than a colony of frogs.' To this passage, one of Swift's editors, I believe Sheridan, adds the following note:—'This similitude, which is certainly the finest that could possibly have been used upon the occasion, seems to require a short explanation. About the beginning of the eighteenth century, Dr Gwyther, a physician, and fellow of the University of Dublin, brought over with him a parcel of frogs from England to Ireland, in order to propagate the species in that kingdom, and threw them into the ditches of the University park, but they all perished; whereupon he sent to England for some bottles of the frog spawn, which he threw into those ditches, by which means the species of frogs was propagated in that kingdom. However, their number was so small in the year 1720, that a frog was nowhere to be seen in Ireland except in the neighbourhood of the University park; but within six or seven years after, they spread thirty, forty, or fifty miles over the country, and so at last by degrees over the whole nation.' What credit may be due to the note, I will not take upon me to determine, though it appears perfectly circumstantial, and given upon the editor's personal knowledge; but Swift's own notice proves indisputably the fact of the introduction, and the period about which it took place."—*Bell's History of British Reptiles*—a newly published volume, illustrated by many exquisite woodcuts, the work of Mr G. Vasey. In this volume we find doubt expressed that toads are ever found enclosed in stones. The author thinks we still require "better and more cautious evidence to authorise our implicit belief in these asserted facts." This is much what Sir Joseph Banks said fifty years ago, during which space many cases have been reported, some of which with such authentication as to make doubt appear, what we have no doubt it mainly is, a mere piece of philosophical affectation. We refer, for a great range of cases more or less authenticated, to an article which appeared in No. 369 of this Journal. Mr Bell observes, that "numerous experiments have been made in order to try whether toads would die on being artificially embedded in masses of clay, of plaster of Paris, in wooden boxes surrounded by plaster, and in other similar circumstances, but hitherto all have failed, although in some of them the animals have certainly lived for a much longer period than could have been expected, prolonged sometimes to many months, or even to between one and two years." We cannot well understand how all

the experiments can be said to have failed, if in some the animals have lived even this comparatively short period without food and air. But if the author will do us the honour to look into the article in question, he will probably join us in thinking that even the most decided failure of such experiments would not be conclusive against the possibility of toads existing for ages in the heart of solid rocks. The probability is, that at the beginning of their imprisonment they were in a frozen or otherwise torpid state, a very different thing from being enclosed in their ordinary condition. The fishes which Captain Franklin took out of the Coppermine River, and which immediately became to all appearance inanimate pieces of ice, but afterwards revived when placed before a fire, would have probably retained life as long as they remained frozen, though for countless ages. The case of the toads we conceive to be almost precisely similar.

PROJECT FOR PRODUCING RAIN AT WILL.

A Mr Espy, of the United States, whose name has become known in this country with reference to the supposed law of storms first developed at the meeting of the British Association last year, is now attracting notice in his own country to a project for producing rain at will. A New York correspondent of the *Athenæum* gives the following account of the project. "Mr Espy begins by laying down these principles:—1. It is known (he says) that if air should be expanded into double the volume by diminished pressure, it would be cooled about ninety degrees of Fahrenheit. 2. I have shown (he says), by experiment, that if air at the common dew point in summer, (in time of drought, 71 degrees), should go up in a column to a height sufficient to expand it by diminished pressure into double the volume, it would condense into water or visible cloud (by the cold of expansion) more than one-half of its vapour—a quantity sufficient to produce nearly three inches of rain. 3. It is known by chemical principles that the caloric of elasticity given out during the condensation of this vapour, would be equal to about 30,000 tons of anthracite coal burnt on each square mile over which the cloud extended. 4. I have shown, by experiment, that this caloric of elasticity would prevent the air from cooling only about half as much as it would, if it had no vapour in it, or about forty-five degrees at the height assumed, which would cause the air in the cloud to be, at that height, about forty-five degrees warmer than the air on the outside of the cloud at the same height. I have shown from these principles [Journal of the Franklin Institute for 1836] that the barometer would fall, under the cloud thus formed, in favourable circumstances, as much as it is known to fall sometimes under the middle of a dense and lofty cloud; and that, consequently, the air would rush in on all sides towards the centre of the cloud and upwards in the middle, and thus continue the condensation of the vapour, and the formation of cloud, and the generation of rain. I have shown, also, that the air does move inwards on all sides towards the centre of the space or region where a great rain is falling, and of course upwards, after it comes in under the cloud, which is so much lighter than the surrounding air; at least, that it does so in all storms investigated, which now amount to sixteen, besides several tornadoes, in all of which the trees were thrown with their tops inwards. From these principles, established by experiment, and confirmed by observation, it follows, that if a large body of air is made to ascend in a column, a large cloud will be generated, and that that cloud will contain in itself a self-sustaining power, which may move from the place over which it was formed, and cause the air over which it passes to rise up into it, and thus form more cloud and rain, until the rain may become general; for many storms which commence in the West Indies, very narrow, are known to move from the place of beginning several thousand miles, widening out and increasing in size, until they become many hundred miles wide."

Mr Espy now goes on to say, that if his reasoning be correct, thus far, great fires and the bursting out of volcanoes should make rain; and he thinks there is proof that they do so. From some of these principles, too, it might be expected that clouds would form over large cities and towns where much fuel is burnt; and Mr Espy says it is found to be so. He refers to Manchester for proof, and also to Mamett's statements, in his collection of facts concerning the Ashby coal field. The connection, then, he argues, between fires and rain, is not accidental. Humboldt acknowledged this in the case of volcanoes, when he speaks of the mysterious connection between volcanoes and rain, and says that when a volcano bursts out in South America in a dry season, it sometimes changes it to a rainy one. Mr Espy, of course, thinks that he has cleared up this 'mystery,' and that what applies to volcanoes applies to other fires in proportion. He explains why they do not always make rain, and states that he is willing to undertake experiments in proof of his argument, provided Congress or the Pennsylvania legislature will reward him in the event of his being successful."

INFLUENCE OF DRESS, &c. ON SIGHT.

An excess of gilding, or, indeed, of any shining or white articles, in rooms, ought to be carefully avoided. Dress, also, it cannot be doubted, exercises much influence on the visual organs; and many naturally good eyes have been permanently weakened by the apparently innocent custom of wearing a veil, the constant shifting of which affects the sight so prejudicially, in its ceaseless endeavours to adjust itself to the veil's vibrations, that I have

known not a few young ladies who have brought on great visual debility by this means alone. Again, tight clothing is manifestly hurtful to the sight; for it needs not to be demonstrated that the effective state of the eyes, as well as that of every other part of the body, cannot be maintained without a free circulation of blood, which is obstructed when the body is too straightly laced or buttoned.—*Curtis on the Preservation of the Sight.*

THE FUTURE LIFE.

[BY W. C. BRYANT.]

From the "Western Messenger," a Religious and Literary Periodical, published at Cincinnati, United States.]

How shall I know thee in the sphere which keeps
The disembodied spirits of the dead,
When all of thee that time could wither, sleep,
And perishes amongst the dust we tread?

For I shall feel the sting of ceaseless pain
If there I meet thy gentle presence not,
Nor hear the voice I love, nor read again
In thy serene eyes the tender thought.

Will not thy own meek heart demand me there—
That heart whose fondest throbs to me were given;
My name on earth was ever in thy prayer:
Shall it be banished from thy tongue in heaven?

In meadows framed by heaven's life-breathing wind—
In the splendence of that glorious sphere,
And larger movements of th' unfettered mind,
Wilt thou forget the love that joined us here?

The love that lived through all the stormy past,
And meekly with my harsher nature bore,
And deeper grew, and tenderer, to the last:
Shall it expire with life, and be no more?

A happier lot than mine, and larger light,
Await thee there; for thou hast bowed thy will
In cheerful homage to the rule of right,
And lovest all, and renderest good for ill.

For me—the sordid cares in which I dwell
Shrink and consume the heart, as heat the scroll;
And wrath has left its scar—that fire of hell
Has left its frightful scar upon my soul.

Yet, though thou wear'st the glory of the sky,
Wilt thou not keep the same beloved name,
The same fair thoughtful brow, and gentle eye,
Lovelier in heaven's sweet climate, yet the same?

Shalt thou not teach me, in that calmer home,
The wisdom that I learned so ill in this—
The wisdom that is love—till I become
Thy fit companion in that land of bliss?

SHAM DEAFNESS.

A marine, while serving on board a ship of war, complained from time to time to the surgeon that he was gradually losing the sense of hearing, and at the end of several months asserted that he was completely deaf. It being, however, presumed that the alleged infirmity was feigned, and as he could not be made to perform his duty, he was brought to the gangway and flogged; but previously to his being paraded for punishment, and during its infliction, he was informed that he should be pardoned if he would admit the fraud and return to his duty. Every means that promised to be successful in surprising him into showing that he possessed the sense of hearing, was resorted to, but without success; firing a pistol close to his ear, suddenly rousing him during sleep, and endeavouring to alarm him, elicited nothing satisfactory. The officers at Haslar Hospital, to which he had been sent, resolved to punish him a second time. Dr Lind, who was then physician to the hospital, begged that punishment might be deferred, with the view of gaining time to try by another experiment whether the man was an impostor or not. His request was granted. The doctor chose a favourable opportunity, and coming unperceived behind him one day, he put his hand on the man's shoulder, and said in an ordinary tone of voice, "I am happy to tell you that you are invalided at last." "Am I!" replied the overjoyed marine. The imposture being thus rendered evident, he was forthwith punished, and sent on board ship.—*Marshall on Enlisting, &c. of Soldiers.*

MARKS OF AN OLD SOLDIER.

Discharged men who re-enlist, and deserters who wish to re-enter the service, frequently omit to state they have been soldiers, and consequently it is of importance to distinguish a man who has been in the army from the ordinary case of recruits. A well-drilled soldier is in general easily recognised; his posture is generally upright, both when he is in motion and at rest; his chest is full, partly from an elevation of the sternum, and also from a greater development of the pectoral muscles; the shoulders are drawn back, and the scapulae nearly approach each other. When, however, he wishes to conceal that he has been in the service, he sometimes assumes a slouching manner, which commonly disappears when he is desired to march smartly backwards and forwards in the inspection-room, and if the word "halt" be given, the influence of discipline becomes instantly evident.—*The same.*

WHAT EDUCATION IS.

Education does not mean merely reading and writing, nor any degree, however considerable, of mere intellectual instruction. It is, in its largest sense, a process which extends from the commencement to the termination of existence. A child comes into the world, and at once his education begins. Often at his birth the seeds of disease or deformity are sown in his constitution; and while he hangs at his mother's breast, he is imbibing impressions which will remain with him through life. During the first period of infancy, the physical frame expands and strengthens, but its delicate structure is influenced for good or evil by all surrounding circumstances—cleanliness, light, air, food, warmth. By and bye,

the young being within shows itself more. The senses become quicker. The desires and affections assume a more definite shape. Every object which gives a sensation, every desire gratified or denied, every act, word, or look of affection or of unkindness, has its effect, sometimes slight and imperceptible, sometimes obvious and permanent, in building up the human being, or rather in determining the direction in which it will shoot up and unfold itself. Through the different states of the infant, the child, the boy, the youth, the man, the development of his physical, intellectual, and moral nature, goes on, the various circumstances of his condition incessantly acting upon him—the healthfulness or unhealthfulness of the air he breathes, the kind and the sufficiency of his food and clothing, the degree in which his physical powers are exerted, the freedom with which his senses are allowed or encouraged to exercise themselves upon external objects, the extent to which his faculties of remembering, comparing, reasoning, are tasked; the sounds and sights of home, the moral example of parents, the discipline of school, the nature and degree of his studies, rewards, and punishments, the personal qualities of his companions, the opinions and practices of the society, juvenile and advanced, in which he moves, and the character of the public institutions under which he lives. The successive operation of all these circumstances upon a human being from earliest childhood, constitutes his education; an education which does not terminate with the arrival of manhood, but continues through life—which is itself, upon the concurrent testimony of revelation and reason, a state of probation or education for a subsequent and more glorious existence.—*The Educator, a volume of Essays on Education, just published.*

WOMAN'S PLACE NOT IN POLITICAL CONTESTS.

Participation in scenes of popular emotion has a natural tendency to warp conscience and overcome charity. Now, conscience and charity (or love) are the very essence of woman's beneficial influence; therefore every thing tending to blunt the one, and sour the other, is sedulously to be avoided by her. It is of the utmost importance to men to feel, in consulting a wife, a mother, or a sister, that they are appealing from their passions and prejudices, and not to them as embodied in a second self; nothing tends to give opinions such weight as the certainty, that the utterer of them is free from all petty or personal motives. The beneficial influence of woman is nullified if once her motives, or her personal character, come to be the subject of attack; and this fact alone ought to induce her patiently to acquiesce in the plan of seclusion from public affairs.—*Woman's Mission, a new work, by a lady.*

A NOCTURNAL SKETCH.

Even is come; and from the dark Park, hark,
The signal of the setting sun—one gun!
And six is sounding from the chime, prime time
To go and see the Drury Lane Dane slain—
Or hear Othello's jealous doubt spout out—
Or Macbeth raving at that shade-made blade,
Denying to his frantic clutch much touch—
Or else to see Ducrow with wide stride ride
Four horses as no other man can span;
Or, in the snug Olympic pit, sit, split
Laughing at Liston, while you quiz his phiz.
Anon night comes, and with her wings brings things
Such as, with his poetic tongue, Young sung;
The gas up-blazes with its bright white light
Now thieves, to enter for your cash, smash, crash,
Past drowsy Charley, in a deep sleep, creep!
But frightened by policeman B, 3, flee,
And while they're going, whisper low—"No go."
Now puss, while folks are in their beds, treads leads,
And sleepers, waking, grumble, "drat that cat!"
Who in the gutter catterwauls, squalls, mauls
Some feline foe, and screams in shrill ill-will.
Now bulls of Bashan, of a prize size, rise
In childish dreams, and, with a roar, gore poor
Georgy, or Charles, or Billy, willy nilly;
But nursemaid in a nightmare rest, chest-press'd,
Dreameth of one of her old fables, James Games,
And that she hears—what faith is man's!—Ann's banes
And his, from Reverend Mr Rice, twice, thrice;
White ribbons flourish, and a stout shout out,
That upwards goes, shows Rose knows those bows' woe.
—*Hood's Comic Annual.*

PERMANENT VALUE OF KNOWLEDGE.

One of the most agreeable consequences of knowledge, is the respect and importance which it communicates to old age. Men rise in character often as they increase in years; they are venerable from what they have acquired, and pleasing from what they can impart. If they outlive their faculties, the mere frame itself is respected for what it once contained; but women (such is their unfortunate style of education) hazard every thing upon one cast of the die; when youth is gone, all is gone. No human creature gives his admiration for nothing: either the eye must be charmed or the understanding gratified. A woman must talk wisely or look well. Every human being must put up with the coldest civility, who has neither the charms of youth nor the wisdom of age. Neither is there the slightest commiseration for decayed accomplishments; no man mourns over the fragments of a dancer, or drops a tear on the relics of musical skill. They are flowers destined to perish; but the decay of great talents is always the subject of solemn pity; and even when their last memorial is over, their ruins and vestiges are regarded with pious affection.—*Rev. Sidney Smith.*

LONDON: Published, with permission of the proprietors, by W.S. OAK, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

PRICE THREE HALFPENCE.

VISITS TO DR ELLIOTSON'S.*

ONE day lately, while residing a short time in London, I dined at the house of a gentleman in the neighbourhood of Portman Square, where I happened to meet and form the acquaintance of the celebrated Dr Elliotson. I had heard of this gentleman only by vague report, and knew little further regarding him than that he had been zealous in the pursuit and practice of animal magnetism, for which he had incurred not a little obloquy and professional animosity. Much as this subject has recently been discussed, I had never paid any attention to it, and probably never should, but for the accident of meeting this eminent magnetist, and being gradually drawn into conversation with him. The good humour of the professor, the vivacity of his manner, and the truthful force of his observations when they bore upon philosophical subjects, gave me reason to imagine that deceit formed no part of his character; but at the same time I put myself on my guard, and was resolved to be carried away by "no sort of nonsense." On my bringing the conversation round to the subject with which his name was so intimately connected, I found that he had formed no distinct code of laws or precise theory regarding mesmerism, as he called it. He said that the experiments he had been able to make, were, in his opinion, highly interesting, as developing physical and mental phenomena of no ordinary kind; that he felt assured there existed in nature an unseen agent or agency, an influence, or whatever it might be called, which flowed from one living animal to another like a stream of electricity, although at the time the animals were not in contact with each other; and that in highly irritable conditions of the bodily frame, that agency produced certain phenomena of a most remarkable kind; that he did not pretend to account for or to understand the nature of the agency; all he insisted upon was, that such an agency existed, that it could be excited into activity, and was therefore, as a truth in nature, worthy of being examined, and to have its phenomena duly recorded. "I do not wish to lead you one way or another," he continued; "but if you feel any inclination to pursue the inquiry, call at my house, and I will perform some experiments in your presence on two patients, and you can think for yourself."

These explanations were so candid and fair, that I at once agreed to go and see the experiments. Tuesday next at four o'clock was appointed for my visit, and at that time I proceeded to the doctor's house, an elegant mansion in Conduit Street, taking with me two gentlemen of my acquaintance, one of them a medical man, who had never seen any experiments in mesmerism, and who I hoped would have all his eyes about him to make sure that there was no trickery or collusion.

We were shown into a splendid suite of rooms, and the doctor, his assistant, and his two patients, immediately made their appearance. The two patients, as he mentioned to me, were sisters, Elizabeth and Jane Okey, the former eighteen, and the latter sixteen years of age. In appearance, however, they were much younger, being small in figure; and I soon perceived that their behaviour was marked by an extreme silliness or infantile imbecility. They laughed, giggled, spoke broken nonsensical language, and ran about the room like two children at play. They could, however, understand what was said to them, and do as they

were bidden, their imbecility not being that of absolute idiots. The doctor explained to us that they had at one time been afflicted with epileptic fits, for which they had been placed under medical treatment in one of the London hospitals; that he had cured them of that malady by mesmerism, but that they were left in the infantile condition in which we now saw them; that this condition was a mode of existence quite peculiar; they had no recollection of any thing, not even of who they were; and they had every thing to learn afresh. He also mentioned that their susceptibility of mesmeric treatment was now excessive; that a single wave of the hand could stupify them, or send them to sleep; and that they were further susceptible of being thrown into a state of *perfect somnambulism*, or *waking sleep*, in which they were in a condition of existence different from the preceding. If I understood him rightly, they are susceptible of three conditions: first, the condition of silliness in which I saw them; second, the condition of somnambulism; and, third, that of rationality, in which all their old recollections revive, and they remember nothing of what has passed while in their other conditions. To these susceptibilities, however, there are occasional and very remarkable exceptions, and at all times their respective states of excitability are different. Both are sometimes so slightly irritable—or the force of the agency is so ineffective—that they cannot be operated upon in the usual manner; but a mode has been discovered of rendering them excitable. This is done by the touch of gold or silver, the contact being made on the palm of the hand.

The first experiment performed was something really startling. I had asked for a glass of water, which the doctor ordered Jane to bring into the room. She had just set down the water bottle and glass on a side table, when Dr Elliotson, at the distance of about twenty feet, and unseen by her, by a wave of his open hand transfixed her in the attitude in which she happened to be at the moment. She seemed frozen to the spot, and thus stood for a minute or two, with the rigidity of a statue. In half a minute she recovered with a sort of shudder, and came running back, whining as if affronted, and sat down on a chair. The series of experiments performed on her while she was looking at us, was equally striking, though some of them might certainly have been the result of previous rehearsal. A wave of a single finger, of two fingers, and of the whole hand, had each a peculiar effect in setting her asleep. The whole hand being passed through the air in front of her, made her, as I have said, stiff and motionless; her hands were clenched so firmly, that I could not with all my strength open them. From this rigid state, and with her eyes shut, she was recovered by the doctor holding the point of his hands (the two palms pressed together) directed to her hand, a process which seemed to relax the muscles, as if something had passed out of his into her hands, though at the distance of one or two inches. A little breath blown by the mouth also appeared to transfix her, and the same thing seemingly recovered her, the breath simply causing an alteration of condition in either way.

The touch of gold, silver, or nickel, or friction with any object, produces a similar effect in setting her asleep. Gold, if held previously in the hand of the operator, has a particularly powerful effect; and a streak of water with a small brush, if the water has been previously blown upon, and had the fingers of a person in it, has the most powerful effect of all; so much so as to be in some measure dangerous to the patient. The touch of, or friction with, iron, always loosens the rigidity, and awakens the patient.
